Office—Room 508 Safe Deposit building, San Francisco, California.

To Our Customers and Friends on the Pacific Coast :

Through frequent complaints made to us, we have learned that unprincipled and dishonest dealers on the Pacific coast have counterfeited our trademark numbers and substituted inferior, spurious goods as ours, when ours were distinctly ordered, thus defrauding the customers and injuring our trade and reputation.

Our goods are acknowledged to be the best, and are fully warranted by us, and are marked with our name or initials or with our well-known trademark and catalogue numbers.

We request direct notice if any goods alleged to come from us, or bearing our trademark or numbers, prove to be other than the best, and perfect in every respect, as we will follow up and expose such frauds for our customers' and our own protection. We have no exclusive agents on the Coast, but our goods are obtainable from all respectable dealers in drawing materials, stationery, hardware, artists' material, etc. Respectfully,

KEUFFEL & ESSER CO.,
New York.

**.Lunkenheimer's.
"APOLLO"
Iron Grease Cup**

Is particularly adapted for Shafting, Pulleys, and all bearings where a reliable and durable cup is wanted. Simple and practical in construction and low in price. Possesses features and advantages not found in other makes of iron cups. Threaded shank is supplied with a common pipe nipple, which can easily be renewed in case of breakage. Specify the "Apollo" and get the best. Satisfaction guaranteed. Made in four sizes, holding from 1 1/2 to 10 ounces of grease. Write for catalogue.

KNIGHTS' WATER WHEEL.

The accompanying cut shows the general arrangement of Knight's Standard Water Wheel of which there are hundreds in use in different States of the Union.

These Wheels are made from 2 feet to 6 feet in diameter, from 10 to 1000-horse power, and adapted to all heads and purposes.

Wheels inclosed in iron cases, from 6 to 24 inches.

Wheels for electrical power can be furnished with or without Governors. Highest regulation guaranteed.

Address all communications to
KNIGHT & CO., Sutter Creek, Cal., or,
RISDON IRON WORKS, Agents, San Francisco, Cal.

CHICAGO, ILL.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

Southern California Petroleum.

Written for the MINING AND SCIENTIFIC PRESS by A. S. COOPER,
State Mineralogist of California.

In Santa Barbara Co., Cal., the Summerland oil-bearing strata consists of a fine-grained sand encased in strata of clay or clay slate. When near the oil-bearing strata the clay or slate is of a bluish color owing to its being slightly impregnated with bitumen. The sands and shales form an elongated dune, the longest axis of the dune being from east to west, running nearly parallel with the coast and parallel with the trend of the Santa Ynez mountains. Near the eastern end of the dune the formation dips about S. 20° E. at an angle of about 50°, whereas on the western end the sand dips about S. 10° W. at an angle of about 60°. The general dip of the sand is southerly at an angle of about 40° or 50°. Nearly all the oil found in California is in dunes.

The first discovery of the hydrocarbons in this field was made on the south slope of the anticline. At this place there was a fumarole from which warm carburetted and sulphuretted hydrogen gas escaped. No vegetation grew on this place owing to the sulphur fumes; it was some 20 feet in diameter. The Spaniards had a legend that a man was killed there, which according to them accounted for the fact that nothing grew upon it. A pipe was sunk in the fumarole and capped and a 2-inch pipe inserted in the cap when the gas was permitted to flow through the pipe. It did so with considerable pressure, and when lighted gave a flame 10 feet in length. On a line nearly east and west with this fumarole other wells have been bored which have yielded gas. The

line are a line of oil wells; they are from 130 to 250 feet deep. The first oil obtained in the field was from a well dug 90 feet in depth which produced three or four barrels daily. The oil is black or dark green and

passages it must ascend through permeable strata to the surface, or, hidden, find its way to the sea. As the Summerland anticline forms a barrier between the Santa Ynez mountains and the sea to the pass-

PUMPING PETROLEUM FROM UNDER THE SEA ON THE SANTA BARBARA COAST, CAL.*

SUBMARINE OIL WELLS AT SUMMERLAND, SANTA BARBARA CO., CAL.*

gas has been employed for domestic purposes.
South of the gas wells on a nearly east and west

*The engravings portray an unusual scene in the petroleum industry. On the sides of wharves or platforms extending 300 feet from shore are wells, from which is raised oil from strata beneath the bed of the ocean, 350 feet below the surface of the water. To Mr. F. M. Selover, editor of the Santa Barbara, Cal., Press, this paper is indebted for the photographs from which the accompanying views were engraved. Since the photos were taken, one of the wharves has been extended 200 feet farther into the sea, and more wells bored with increasing flow of oil therefrom.—EDITOR.

is of a very heavy gravity, being 11° to 16° Beaume. Judging from other oil fields, the northern dip of the sands of this anticline will be barren. Meteoric water falling on the higher ground of the Santa Ynez mountains, which at places reach an altitude of 3600 feet, penetrates the earth through inclined and porous strata, or through fissures, cracks, seams and joints. After flowing through subterranean

age of the water, it is forced by hydrostatic pressure to ascend through the north dip of the sand of this anticline. Owing to its inferior gravity the petroleum oil is floated upwards by the water and is lost on the surface of the earth or carried over to the south dip of this anticline. With the southern dip of this anticline it is different; the flow of water is downwards, the oil remaining on top of the water by its buoyancy.

Owing to the large amount of organic matter in the shales underlying the Summerland oil field, if any iron was present during their deposition it must have been in the form of ferrous carbonate. The carbonate of iron imparts a bluish or greenish color to the deposit. When the shales in which carbonate of iron exist are turned red, it is caused by chemical heat. The presence of red shales below the Summerland oil strata, as is shown by a well drilled to the depth of 1000 feet, and the high temperature of the natural gas, shows that chemical changes are in active operation at present beneath this field. It is probable that sulphur compounds, liberated by chemical heat in the shales, have resinified the petroleum oils of Summerland, which will account for their great gravity.†

Through wells it has been determined that the oil sand lies but a short distance north of the shores of the Santa Barbara channel, and that the dip of the formation, being 40° or 50° towards the south, will carry the sand below the surface of the ocean.

Recently a wharf has been extended into the ocean, from which wells have been sunk and are productive, the oil being of a lighter gravity than that obtained in the upper portion of the oleiferous strata. As a general rule, in California the further the oil is removed from atmospheric influences the lighter its gravity.

† Resins or asphaltum can be formed from California oils by the addition of sulphur.

Large High Speed Water Wheel; Hearing Heat and Cold; Gear and Friction Hoist; Is Darwinism True? 380. Commercial Paragraphs, 394.

CALIFORNIA petroleum is the subject of considerable present investment. The supply and demand constantly increase, both in crude oil for fuel and refined for finer purposes. The temporary diminution of the Los Angeles product is more than made up by developments in adjoining counties. An unusual method of securing this natural product is illustrated on the preceding page, 373—viz: by pumping from under the sea, the submarine oil strata being found at a depth of 250 feet. In connection with this matter the suggestions of the State Mineralogist regarding surface formations may prove of practical value to the oil prospector and investor.

COAST industries are interested in the action of the joint international commission, now in session in Quebec, as to the removal of the present 67 cents per ton duty on coal imported from British Columbia. Oregon and Washington coal producers naturally desire the retention of the tariff; British Columbia producers and California consumers favor its abolition. Washington coal mine owners argue that San Francisco cannot expect to get coal any cheaper if the duty were removed, as British Columbia mine owners would still have a monopoly, and assert that in the greater development of coast coal in American territory lies the most satisfactory local solution of the question. So far as San Francisco is concerned anything tending to reduce the present price of coal would be welcomed by local manufacturing and industrial interests.

FOR nearly five months have been appearing portraits of the successful naval heroes of the late war and eulogies of their gallantry, skill and courage, all of which is deserved. It is right and proper that such patriotic effort, energetic skill and daring courage should be given full recognition and grateful prominence. But the officers of the line are not the only ones in the late war that deserve well of their country. Fully equal to them in point of bravery, skill and courage were the naval engineers. To these latter, no less than the former, is due whatever gratitude and admiration the country sees fit to bestow. None the less than the officers of the line did the engineers exhibit genius, skill and devotion, and it is but a simple record of a plain fact to note that it was the heroic ability of the engineering staff of the U. S. navy that made victory assured.

FROM the U. S. Geological Survey, Washington, D. C., is received the latest in the series of contour, topographical, and geological maps constituting a geologic atlas of the United States, the one receiving present notice being the Bidwell Bar, Cal., folio, comprising portions of Butte, Plumas, Sierra and Yuba counties, Cal. The characteristics and practical value, their manner of production and their fidelity to detail, have been heretofore noted on the

receipt of other members of the series, and the favorable comment hitherto made can only be repeated regarding the present one which is uniform with its predecessors in completeness and value. The ability and intelligent economy of effort exhibited by the director of the U. S. Geological Survey and his subordinates is sufficiently exemplified in this great work to need no more than passing recognition.

A QUESTION of constant interest to miners is discussed and illustrated on page 378, regarding "ore in sight," and "estimated ore." Nothing in the way of "ore in sight" can be given value approximating any degree of correctness, that can not be measured on three sides, "the fourth dimension" having no place therein. The prospective value of the mine can be inferred from this "ore in sight," from the nature and method of occurrence of the ledge or deposit, from the indications and character of the ore and the general reputation of the district. And "prospective value" is still a prominent factor in the transfer of mining property. It is borne in mind, however, by most mining engineers and "experts," that while "ore in sight" can often be closely figured as to bulk and tonnage, the question of value per ton can never be accurately answered prior to treatment. How to correctly figure the value of a mining property is not a perfect art. In this much depends on the artist. More reputations have been won and lost in the mining world by figuring or guessing the net yield of "ore in sight," or "estimated ore" than in any other way, and, incidentally, considerable cash has been likewise lost in that way.

THE 800-page report of the U. S. Commissioner of Patents for 1897 is illustrative of the progressive genius of the American people. During the last year there were 23,729 patents issued; of these 21,508 were to citizens of the United States and 2,221 to citizens of foreign countries. Perusal of a list of the subjects of invention shows it as a great sea that washes every shore of human thought. This annual record of ingenuity is one of the creation of new industries and the employment of old ones, making life safer and more convenient, alleviating distress, advancing every department of science and industry, and improving every condition of humanity. Old things are improved, new ideas made practical, and nothing is too mighty or too insignificant to be ignored. In some cases it is difficult to see how homely things of constant universal use could be improved, as, for instance, where last year 74 new and distinct devices in improvement on the wrench were patented, or in the case of the horse-shoe, which was the subject of 66 new patents in 1897. Valves, which are always a subject for study, occasioned the issuance of 200 patents, the steam boiler 52, and the gas engine 58. Of course, the usual phalanx of car coupling inventions were in evidence, and the ubiquitous bicycle, though a cursory glance along the pressing demands of the times would hardly show the existence of a void that justified last year 38 patents on pumps, and 21 on rivets. Probably no publication is more practically suggestive of the progress and mental activity of the country.

In the issues of Aug. 13 and Sept. 24, '98, reference was made to the substitution of aluminum for copper in carrying electrical current and other industrial uses, and the belief expressed that the output and price of the former metal would preclude commercial competition with copper. In connection with this subject, A. E. Hunt, who is identified with the development of the aluminum industry, presents some arguments in favor of the substitution of aluminum in place of copper for electrical conductors, for telegraph, telephone and railway services. He cites the fact that, while the electric conductivity of aluminum is 63 per cent. that of copper, the weight of the latter metal is 3.33 times that of an equal volume of aluminum, and that though the cross-section of an aluminum conductor were increased sufficiently to give it equal conducting with copper, the weight of the larger aluminum conductor would be only 48% of that of the copper conductor. Regarding cost, Mr. Hunt says: "To obtain, therefore, a conductor of aluminum at the same cost of metal per mile, the cost per pound of the aluminum may be 2.1 times greater than that of copper. Assuming the cost of the copper at 14 cents a pound, it is evident

that aluminum at 29 cents a pound is slightly cheaper than copper." It is further argued in favor of the light metal that aluminum wire can be supplied at about the same tensile strength per unit of area as that of annealed copper—32,000 pounds per square inch; but, as the aluminum conductor will have a larger area to make up for its deficient conductivity, it will be stronger. Regarding the use of alloys of aluminum for this purpose, Mr. Hunt holds that while a number of such alloys can be made which are much stronger than the pure metal, they appear as a class to reduce the electric conductivity. One of these alloys which he refers to appears to be well adapted for the production of electric conductors, having a tensile strength of 65,000 pounds per square inch, and an electric conductivity of 50. As to the difficulty of soldering or brazing aluminum he suggests that mechanical joints might be tried. The experimental tests now being made will aid in determining the economic aspect of the matter. It is believed, however, the lowest limit of cost at which aluminum can be produced will not permit of its supplanting copper in the electrical field, as a matter of economy.

THE most recent industrial advance that gives great promise of economical result is the utilization as a motive power of what has been a waste product in blast furnaces. It comes in line with the increased use of the gas engine, and is a long step ahead in shop economics. It has long been known that for every ton of pig iron produced by a blast furnace there is sent out from its top an average of 150,000 cubic feet of combustible gas. This has hitherto been a waste. It is now commercially feasible to use this blast-furnace gas in the cylinder of a gas motor, thus supplanting the gas-fired boiler. This discovery of a new source of motive power has passed from the problematic to the practical phase, and is soon to be considered a settled fact. For some time gas engine makers have been successfully increasing the sizes of their motors, and blast-furnace men have been experimenting with the waste gas from the tops of their furnaces, and the efforts have now been combined. In Europe and in the United States two years' experimental work has resolved the question into a commercial success. In the works of the Cockerill Co. a 200 H. P. gas engine is entirely supplied with gas from the blast furnace, hitherto wasted in the atmosphere, but now used in generating power.

In accordance with its usual custom, when the Klondike fever broke out in '97 the MINING AND SCIENTIFIC PRESS was first to secure and publish authentic scientific data for the use of prospectors, miners and gold seekers, written by men on the ground, old experienced miners. That this was of value was evinced by subsequent events. Later occurrences also showed that inasmuch as false and misleading statements were being made by many interested in inciting travel, that an even more detailed statement of the gold regions of the extreme Northwest was necessary. Accordingly the services of a man in every way qualified for the work was secured, and beginning with the issue of the 22nd inst. will appear what is believed to be the best treatise on this important subject so far published. While strictly scientific, it is as strictly practical, giving information of great value to the gold seeker, just the kind of information he most needs, and for the first time this whole subject is treated in detail from a scientific mining standpoint by a practical placer gold miner, who knows just what he is talking about. A perusal of this forthcoming article will be the means of saving many a miner fruitless expenditure of time and money, and, probably, life itself, should he propose a journey in those dreary northern wilds. Few men are content with being told that a thing is so without having the reasons coupled with the statement, so that they can judge of the correctness of the assertion by the proofs adduced. In the article under discussion is clearly discussed in detail the "glacial theory," and as clearly shown why placer gold is and can be found in parts of that region, and why it is not and cannot be found in other sections. The article will be read with interest by every one in any way connected with gold mining in every part of the world.

Concentrates.

The United Verde mine at Jerome, Ariz., employs 700 men. The reserve fund of the Portland M. Co., Cripple Creek, Colo., amounts to \$700,000.

The quartz and placer mines of Lemhi Co., Idaho, produced 15,000 ounces of gold in '97.

Supt. Kinkadee has begun working the tailings at the Homes mine, Candelaria, Nev.

A technical description of the Fauvel gold recovery process appeared in the issue of Jan. 4, 1896.

W. J. HAYTER was killed recently in the Le Roi mine, Rossland, B. C., by a rock falling from a slope.

In the Rand, S. A., district the average cost of sinking a timbered shaft, $5\frac{1}{2} \times 18$ feet, is \$125 per foot.

The Montana School of Mines at Butte, Montana, will not be opened this fall because of a lack of funds.

An agent who makes a contract in his own name, without disclosing his agency, is liable thereon as principal.

Geologically speaking, "serpentine" is ordinarily decomposed granular intrusive rock, either peridotite or pyroxene.

In the Lake Superior iron mines ore is mined 600 feet below the surface and delivered on the cars at a total cost of 67 cents per ton.

A "chispa" is a small bright fragment or spangle of gold, worth from 10 to 50 cents—an old Spanish term for a miniature nugget.

There are still several glaciers in the California Sierras. The best living authority on that subject is John Muir, Martinez, Cal.

In '97 Norway produced 1035 tons of copper ores with 20 per cent of copper, some 1000 tons of poorer copper ores, and 90,000 tons of iron pyrites.

The amount of dividends declared by the Bullion-Beck mine at Eureka, Utah, is \$2,187,000. Those of the Mercur mine amount to \$1,191,000.

There is a pumice deposit in Sonoma Co., Cal., that would be worked if demand warranted it. In Utah are also deposits of pumice stone of considerable extent.

In a single hand drilling match at Boise, Idaho, Oct. 6th, H. Andrea made 13 inches in fifteen minutes. The block was blue granite, full of mica schist, and flinty.

The aggregate California gold yield for '98 will be the smallest for several recent years, because of the drouth, which curtailed every product of the State.

The largest number of stamps under one roof in California is at the Golden Cross group, San Diego, Cal. In the hands of the receiver the mine has proved profitable.

The only quicksilver mine that "Concentrates" knows of where concentration is practiced is the Manzanita, Lake Co., Cal. The cinabar ore there also carries gold.

The price of quicksilver, like every other commercial product, is regulated by the laws of supply and demand. The present duty on imported is 7 cents per pound.

The Wedge mine, near Randsburg, Cal., since its incorporation in April, 1897, has paid \$42,500 in dividends. The total investment in the mine and mill property was \$6500.

Since the war tax went into effect incorporation of million-dollar corporations is more expensive and infrequent. As at present, such incorporation costs several hundred dollars.

About this time "souvenirs," "official programmes" and "special editions" that nobody sees (except the contributors thereto) are being projected upon an overburdened community.

The Star mine, Cherry Creek, Nev., is now marketing smelter ore carrying nearly 3000 ounces silver per ton. A plant with a daily 150-ton capacity will be in operation Jan. 1st, '99.

The Graves and Graeter dredges near Bannack, Mont., operating steadily since last April, are said to be netting from \$1200 to \$1800 a day. They have a crew of sixteen men to each boat.

D. BEEMAN and C. Zeuckwert, ascending the shaft in the Martha Washington mine, Silver City, Utah, when within 100 feet of the top, the skip overturned, they fell 300 feet and were killed.

OWNERS of unpatented mining claims have until Jan. 31st, '99, to file the necessary affidavit that \$100 in work or improvements was put on the claim during the year ending Dec. 31st, '98.

The average cost per ton of ore produced last year by the Anaconda Copper Co. was \$3.77 net. The total cost of mining and treatment was \$7.98 per ton. The average yield was \$11.22 per ton, a profit of \$3.33.

In the American M. Co.'s mill at El Oro, Mexico, J. Bevro was watching another adjust some belting; the belt dropped, and, looping itself about Bevro's neck, switched him against the machinery, killing him instantly.

One member of a firm makes and delivers a note signed by him in the name of the firm, to secure his individual debt, and this with the knowledge of the one to whom the debt is to be paid, the firm is not liable on the note.

The Australian record for shaft sinking in '98 has been made in the Brilliant Deep Lead, Charters Towers—1053 feet through hard grey granite in eleven months. The shaft is a three-compartment, 12 feet by 4 feet in the clear.

The monthly payroll of the Le Roi mine at Rossland, B. C., to its employees the 10th inst. was \$28,000; the monthly account for supplies was \$14,000 additional. The mine has 285 men on its payroll and operates twenty-seven drills.

In the administration of the public lands the decision of the Land Department upon questions of fact is conclusive, when brought to notice in a collateral proceeding, and it is only questions of law that are reviewable by the courts.

Bismuth is again reported discovered near Grant's Pass, Or. It is not an uncommon find, the largest deposit, so far as known, being at Golden, Colo. The ore is reduced in Saxony and London. Its present worth is about \$1.75 per pound.

The New Zealand government is still offering a bonus of 4d per pound for the production of the first 100,000 pounds weight of good marketable quicksilver from any mine in New Zealand. One-third of the quantity must be produced before the 31st of March, 1900, and the remaining two-thirds before the 31st of March, 1901.

In the Morning mine at Wallace, Idaho, while thirty men were at work, an accidental explosion of 350 pounds of dynamite occurred. The cause of the explosion is unknown. When

the smoke and gas had passed sufficiently to permit rescuers to enter, they found nobody seriously hurt, the only casualty being the killing of a horse.

The first message over the Canadian Pacific Railway Co.'s new transcontinental copper telegraph line was flashed from Montreal, Canada, to Vancouver, B. C., last week, a distance of 2900 miles. This is claimed to be the longest land circuit in the world. In passing over this long distance the message occupied one-fifth of a second.

The Standard Oil Co. is credited with intent to control the Butte, Montana, copper companies, consolidation of the Anaconda, Boston & Montana, Butte & Boston and Montana Ore Purchasing Co. being locally but mistakenly foreshadowed. The four mentioned companies to the 1st inst. had declared dividends aggregating \$13,755,000.

This paper knows nothing of any "renewed development in the Mariposa grant." The usual statements that the owners have got together and propose to develop it are about due. The 49,000-acre grant has for forty years been in the way of working Mariposa Co., Cal., mines, and, for aught "Concentrates" knows, may be for forty more.

"I SEND 6 miles for my paper every week, and would send 16 if necessary," writes a Shasta Co., Cal., subscriber. "The MINING AND SCIENTIFIC PRESS is the most welcome of all the papers I get," says a Boulder, Colorado, man. "I notice a constant intent to be reliable in all statements," is the comment of a Prescott, Arizona, mining engineer.

The Canadian Geological Survey places the mineral output of the Dominion last year at \$28,000,000, an increase of \$6,000,000 over the previous year. The output is divided as follows among the principal mining provinces: British Columbia, \$10,455,268; Nova Scotia, \$6,000,000; Ontario, \$5,000,000; Quebec, \$2,063,266; Northwest Territories and Yukon, \$3,000,000.

COLORADO and California have lost millions by forest fires in the past ninety days. The annual report of the Commissioner of the General Land Office estimates that over 11,000,000,000 feet of public timber have been destroyed by fire in the past thirty-five years. The report says forest fires form the main subject for the attention of the Land Office now.

ORDINARY commercial nitric acid is worth 5 cents per pound; extra, 12 to 15 cents, approximately free from chlorine. The kind used by the San Francisco Mint is 9 cents per pound. When nitric acid is pure only the silver dissolves, but if not pure some of the gold dissolves; in the processes used in the mint, if the gold is not thoroughly sweetened, a small percentage of the gold will pass off in the acid.

An alloy closely resembling gold is composed of copper 94 parts, antimony 6. The antimony is added after the copper is melted; subsequently sufficient magnesium carbonate and calcium are added to increase the specific gravity. The alloy looks like gold, can be hammered and soldered, and is unaffected by nitric acid. It appears to be particularly well adapted to the manufacture of "gold bricks."

TWO MINERS recently found a large gold nugget in Kizir creek, in the Minusinsk district of Siberia. It was found in a prospecting shaft 66 feet below the surface. Its weight is 850 ounces and its value \$15,500. This is one of the largest nuggets found in Russian territory, the largest one yet found having weighed nearly 1300 ounces. The Kizir nugget is 8 inches long, 5 inches wide and $2\frac{1}{2}$ inches thick.

AT MONTREAL, Canada, McGill University recently completed chemical and metallurgical laboratories at a cost of \$350,000. The mining department is equipped with three rock breakers, Cornish rolls, screens of all sizes, a battery of 1000 and another of 600-pound stamps, and a Huntington mill, each with its complement of plates and concentrators. It has also a set of amalgamation pans, a chlorination and cyaniding plant.

OF the fifteen electrolytic copper refineries in the United States, all are east of Chicago, except three. One-half of the output of the Anaconda is refined in Baltimore, and the United Verde Copper Co.'s output of Arizona is refined near New York City. The copper matte from the Mountain Co. of Shasta Co., Cal., is refined in New Jersey. It is said that that company contemplates the erection of a refinery at the Keswick smelting works.

A SAN FRANCISCO BANK has effected an arrangement with the United States Government which will render unnecessary the recently contemplated shipment of \$10,000,000 in silver bullion from Philadelphia to the mint in San Francisco. The bank which is the heaviest dealer in silver bullion on the Pacific coast will deposit silver at the San Francisco mint and receive certificates therefor, which will be available for use in New York, thus saving the cost of transportation across the continent.

THE "last spike" in the C. P.-U. P. railway connection was driven May 8th, '69, at Promontory Point, Utah. Sacramento was then the California terminus, river steamers carrying San Francisco passengers. During the twenty-five years ending May 8th, '94, the overland arrivals via the Pacific Railway at San Francisco were 1,573,700; the departures for that period were 1,036,600. The population of California in '70 was 560,247; in '80, 804,336; in '90, 1,208,130; at present it is probably 1,750,000.

LAST August a gold nugget was found in Western Australia weighing between 95 and 100 pounds. The discoverers confided the secret of the location of the find to their local clergyman, who, according to agreement, announced that on the 11th he would divulge the locality. At the hour named 6000 men were present and before the clergyman had finished telling where the nugget was found there was a stampede for the locality named equal to a rush on the Colville reservation, everyone hoping to at least make a location that he could sell on the strength of its proximity to the place where the big nugget had been found at a depth of 16 feet.

THE annual report of the Commissioner of the General Land Office makes official reference to the Benson land surveys in California. He says July 1, 1898, was the date fixed as the limit for new surveys to be made and notes filed with the Surveyor General of California. He reports now that no field notes were filed on the date mentioned, but he has received assurances from deputies that the work of field correction is in progress and that field notes of the work on each contract will be filed as fast as they can be prepared, and the returns of all these suspended surveys will be in the hands of the Surveyor General of California in proper form before Dec. 1st, '98.

WHEREAS any one or more of the co-owners of an unpatented claim fails to contribute his or their due share of the required annual expenditure thereon, those of the owners who want to hold the claim, and have complied with the requirements for

annual assessment work, may give notice to such delinquent at the close of the calendar year for and in which the work was done. This notice must be in writing or by publication in a suitable newspaper once each week for ninety days—thirteen insertions. The delinquent so notified has ninety days from the date of the written notice mailed to his last address, or ninety days from the last publication of the published notice. If he fails or refuses to contribute his just proportion his interest in the claim becomes the property of those complying with the requirements of section 2334 U. S. Revised Statutes. This subject is most exhaustively discussed editorially in the issue of Sept. 3rd, '98.

THE steamer Al-Ki brings a United States Geological Survey party that has been working in the Cook Inlet country, Alaska. They left on the gunboat Wheeling last April and proceeded to Cook Inlet, where they spent the summer. Their work was principally in the vicinity of Tyonik, the correct spelling of which, they say, is Tyonak. Thence they went almost the entire length of the Beluga river, up to Mount Shushitna and down to Lake Clark and Redoubt volcano, besides penetrating the interior a considerable distance. Extensive maps were made, showing the streams, lakes, soil and rock formation, altitudes and other topographical and geological information. They found many indications of placer gold, although they did not go on a prospecting expedition. There are few people left at Sunrise City of the 2000 who were there six months ago, and there are plenty of provisions there to last during the winter. Valdes, on Prince William sound, has 600 or 800 prospectors, who are said to be destitute. Most of them are from the Copper river, where they spent from six months to two years in fruitless prospecting.

"HOW TO BUY A MINE" is a question not easily answered. Much depends on the amount of money to be invested and the knowledge the intended investor has of mines and mining. If he has little or no knowledge of the business the better plan would be to commission some one who has. If, however, the would-be purchaser knows enough about the business to sample a mine, then he might get the opinion of as many as possible of the prospectors and miners who are familiar with the mine and its value, and carefully note what each says, making due allowance for the disparaging remarks always made by disappointed men. He might also have his samples assayed by several local as well as outside assayers, always giving the assayer samples in pulp, retaining a sufficient quantity of each sample for other assays, and have assays made by an assayer who is exclusively in that business, bearing in mind that he wants quantity, grade and title. Make all investigations as to title through a reputable abstractor or attorney, or both, and buy no property with a clouded title. If not satisfied with the quantity or grade of ore, secure a limited bond and make further developments, as well as mill runs.

In cyanide treatment of slimes W. B. Gray holds that, as between precipitation by charcoal or zinc, the former is the cheapest and best. Talking from a South African standpoint, he says: "If you allow the cyanide of gold to flow through charcoal at the rate of 300 gallons per hour, you will get at the rate of nine ounces of gold in your top filter. The cost of charcoal in each filter is about 2s, or for each ounce of gold saved in the filter the cost is £2 3s 4d. By zinc precipitation, under the most favorable circumstances, 1 pound of zinc at 6d per pound will be consumed for each ounce of gold. This is a cost of 6d for each ounce of gold obtained, independent of all other treatments, against £2 3s 4d by charcoal. There are also other considerations. The gold from charcoal precipitation is worth from £4 to £4 2s per ounce, while the gold from zinc precipitation is seldom worth more than from £3 to £3 15s per ounce. Another point in favor of charcoal is that it will precipitate the gold from the weakest solution of cyanide, while the zinc will not satisfactorily precipitate unless the solutions are kept up to their working strength. With charcoal, where it is used, the solutions are constantly pure and clean, while there is so much zinc destroyed by the zinc process that the solutions must of necessity become heavily charged with zinc and have to be renewed in course of time."

ANOTHER batch of inquiries is received regarding annual assessment work, some implying disbelief in the announcement in the issue of Sept. 24, that "in the case of a mining claim located any time after Jan. 1st, '98, the locator or locators have till Dec. 31st, '99, to do the \$100 worth of work required by the Federal statutes." That is a precise statement of the exact fact, the article in question being a sufficient answer to a multitude of such queries annually received. Three write that they "have bets up." Those who bet on the accuracy of the statement will win. One miner writes from Republic, Wash., that a man bet \$50 with him that a claim located Jan. 1st, '98, and not worked was "jumpable" Jan. 1st, '99. Our correspondent is \$50 ahead on that proposition, so far as Federal statutes apply. This paragraph has no application to State or local laws. For the last time this whole question is referred to for final answer. It does seem singular that a mining claim located say Jan. 1st, '98, can be held without a lick of work till Dec. 31st, '99, but such is the strict legal interpretation of the statute. On this subject, Sec. 624, "Lindley on Mines" says:

The requirement as to the performance of annual labor is imperative. While a timely resumption of work may save a forfeiture, the contractor must be diligent in his ingenuity in attempting to avoid this plain and wholesome requirement. The courts are disposed to deal with these drones in the hive with much more leniency than they deserve. The statute is too frequently applied on sentimental lines. Forfeitures, say these tribunals, are odious, and in many cases the reluctance with which they enforce the law encourages, rather than deters, the systematic evasion of it.

The statute is extremely liberal as to the time in which the specified amount of work shall be performed. A location made on Jan. 1, 1897, may, in the absence of State laws or local rules requiring development work to be performed as an act of location, be held without a stroke of labor until Dec. 31, 1898, and in no case is the period less than a full year. It would seem that a more rigid enforcement of the rule would not only command more respect for the law, but would, in a great degree, tend to promote the general object and intent of the mining statutes—the development of the mining resources of the country. As was said by the Supreme Court of the United States, speaking through Justice Miller: "Clearly, the purpose was * * * to require every person who asserted an exclusive right to his discovery or claim to expend something of labor or value on it as evidence of his good faith, and to show that he was not acting on the principle of the dog in the manger." As it was in the days when mining privileges upon the public domain were governed by local rules, so it is now the invariable rule, that the locator's only right to possession depends upon the performance annually of the specified labor. The grant flowing from a perfected valid location is only perpetuated by "representation."

The San Juan, Colorado, as Seen From Telluride.

With Red Mountain as a center, draw a circle having a radius of thirty-six miles, and you encompass the mining districts of the San Juan. Within this circle will be Ouray, Telluride, Red Mountain, Silverton, La Plata, Rico, Ophir, Eureka, Bear Creek and Lake City. In the aggregate these districts possess about sixty-five producing mines and thirty operating mills, at which about 5000 men are employed. By means of better roads, more capital and an increasing population, these San Juan districts are getting to be close neighbors. Fairly good trails now traverse the mountains within the circle described, and during the summer and autumn the short cuts from one place to another are in constant use. I speak of this to illustrate how the San Juan, as a distinctive section of Colorado, is carrying on business to a large degree within itself. All these principal points are connected by rail, the Denver & Rio Grande reaching Lake City, Ouray, Silverton and Eureka, and the Rio Grande Southern taking in Telluride, Ophir, Rico and passing near

this is shipped in the crude, the bulk of it being concentrated in the ratio of about five tons of ore into one ton of concentrates. The large mill, thus handling about 190 tons per day, is at Pandora, two miles above Telluride, at the terminus of the Smuggler tramway line, which makes an ascent of 4000 feet in the distance of two and one-half miles to its upper terminus in Marshall basin. The Smuggler workings extend along the trend of the vein for more than a mile, from below Smuggler postoffice to the Sheridan and Mendota, near the great divide. According to the survey maps this mammoth vein extends to the Ouray side of the range, paralleling the Virginus lode. The Smuggler ores vary considerably at different depths and different locations. Generally they are a sulphide, the values being in silver, lead and gold. Tailings from the Smuggler-Union mill to the amount of 200 tons a day are handled by a canvas-plate tailing plant owned by A. E. Hampson and J. L. Wells. They assert that they ship ten cars per month of concentrates as a product.

The gulch, which extends northward from the valley near Pandora, divides, just below the crest of the range, into three amphitheaters, called Savage, Marshall and Middle basins. Going to the ridge

mine, worked under lease by F. G. Wilson. This property is equipped with a mill which is concentrating about 60 tons of ore per day. The product is silver and lead.

The Valley View mill, in the same locality, is treating about 30 tons per day of gold ore.

In Middle basin is the Montana. At the foot of the same basin is the Ophir tunnel. Both properties are being worked by the parties interested in the Revenue tunnel on the Ouray side. It is claimed the Ophir tunnel and the Revenue are on the same level and that the purpose is to connect the workings on both sides of the divide.

Scotch capitalists are interested in the Meldrum tunnel, which starts above Pandora, near Bridal Veil falls, takes a course toward Red Mountain, the idea being to cut under the mines in Savage basin, to cut blind leads and form a transportation passage way for electric cars from Red Mountain to Pandora, thus making a connection between the railroad at Red Mountain and the Rio Grande Southern at Pandora.

On the Telluride side 1000 feet have been driven and some work is in progress at the Red Mountain end.

At this writing the mountains in the San Juan

JAPAN MINE AND MILL, SAN JUAN DISTRICT, COLORADO.

La Plata. The Silverton & Red Mountain Railroad connects the two points indicated.

In previous correspondence some special attention was given to Ouray, Red Mountain, Silverton, Ophir and the La Platas. It is the purpose here to write briefly of operations in the vicinity of Telluride.

In Cornette basin, two miles north of Telluride, is the Liberty Bell group of mines, the promotion of the U. S. & B. C. M. Co. of Kansas City, Mo. This company develops mines in various sections of the West. To operate this particular property the Liberty Bell G. M. Co. was organized, Arthur Winslow being manager and J. W. Mercer being superintendent. The mine is developed through three levels, which are on the vein. Levels and tunnels aggregate 2000 feet. The ore is a quartz, partially free milling, the values being gold and silver. It is understood to be rather low grade. At the mine are ore bins and crushers. From this point a new wire rope tramway, two miles long, carries the crushed ore to the new mill in the valley near Telluride, making a descent of 2300 feet in that distance. The mill is being equipped with twenty stamps, amalgam plates and concentrators, and will operate by electric power. The mill will be operating within a month.

The Smuggler-Union, which has been for years one of the camp's great standbys, is producing about 200 tons of ore per day. Only about ten tons per day of

above Marshall basin, you look down upon the Revenue and Virginus on the Ouray side. Ascending from Savage basin to the divide, you look over upon Red Mountain and down upon Camp Bird in Imogene basin.

In Savage basin is the Tom Boy mine and mill, the Japan mine and mill and the Columbia. The Tom Boy mill is treating 150 to 175 tons of ore per day, the greater values being in gold and 90 per cent of which are saved on the amalgam plates. This is primarily a gold property, there being only a small saving of silver. The ores consist of an oxidized quartz, accompanied by talc and lime. At greater depth lead values of importance are found. The concentrates run from 11 to 20 per cent lead. The ores of the Tom Boy and those of Camp Bird are similar, and they are supposed to be parallel veins. Except for the air compressors, the Tom Boy Co. utilize electricity for power.

The Japan mill, which has crushers, rolls, jigs and concentrators, is handling 75 tons of ore per day. This is purely a concentration proposition, the product being of about equal values in gold, silver and lead. This property ships about 60 cars a month of concentrates and assorted ore. The Japan workings are mainly through a crosscut 1850 feet long, which cuts the first vein at 250 feet. It cuts parallel veins at greater depth.

In the gulch below the Smuggler is the Cimarron

region are almost devoid of snow and a scarcity of water is felt among the mill operators.

Telluride, Colo., Sept. 22d, '98. WASCOTT.

Battery Amalgamation, Etc.

TO THE EDITOR:—The article from the superintendent of the Bald Eagle M. Co. in your issue of Sept. 24th is interesting and of value, but seems to call for further explanation of the amalgamation test noted in your issue of Aug. 30th.

It would perhaps have been better to have called it a "loss of quicksilver test," as that was the primary object in making it. All the stamps, however, ran with the same speed, drop and discharge, with the same mesh and equal surface of screen throughout, and all the batteries were fed from the same bin, so that there was not much chance for the difference in the value of the ore or quantity crushed by the two sets of batteries to make all the difference in the amalgam won. As noted before, the test was for two weeks, all plates, riffles, etc., being cleaned and product weighed up. The loss of quick would not have been greatly affected had the one lot of ore varied in value from the other. The former loss of 3 pounds of quick to the 700 tons of ore crushed has been reduced to 1½ pounds as a maximum, and to 1 pound to 200 tons in the last 1000 tons crushed. This includes all loss—handling, retorting, etc. The

thin amalgam noted previously resulted from change of temperature after cleaning and squeezing. A pound of this amalgam, thoroughly cleaned and squeezed hard in hot water, goes \$40 to \$50.

This being the first full season the company has used stamps, the mill work has included many tests, etc., not expected or required after the best methods are once definitely settled.

E. L. BALLOU.

Pony, Mont., Sept. 30th, '98.

Electric Transmission in California.

In no part of the country is long distance electric transmission being given so much present practical operation as in California. The Sacramento-Folsom plant, and those at Bodie and Fresno have been the subjects of universal interest. At Redlands, Cal.,

special designed pocket and centrifugal apparatus to prevent water from leaking upon the shaft. The bearings are of the ball socket, self-oiling type. The governing is done by a device that swings in front of the nozzle, shutting the water off and turning it on as may be desired. The capacity of these wheels is 550 H. P. each pair, making 2200 for the total installation. Each pair is coupled direct to a Westinghouse two-phase generator. The water is conveyed through 700 feet of 36 inch steel pipe to a 48 inch receiver, where each pair of wheels has an 18-inch branch pipe at right angle, each wheel having a separate gate tapped to this 18-inch branch so that it can be used independently. The regulation is accomplished by a Tutthill patent water wheel governor, direct acting, having a cylinder with weighted piston links attached to piston weight and connected to hooding device, so that when the pis-

Yukon pioneer deserves unlimited praise for what he has done and his method of working.

To mine in the Yukon district under prevailing climatic conditions at all future time will be severe. A miner with an outfit and good health, having had some past experience, requires neither outside education nor knowledge to make a success on the Klondike, and his individuality and ability to take care of himself on the verge of the Arctic Circle and determination to stay there until it melts or he comes out a king (as the lucky ones are locally termed) is commendable.

The Yukoner scorns sympathy and judges every newcomer by his ability to undergo hardships. He never complains nor wants to hear the complaints of others. If he takes a lay on a claim belonging to another, he agrees to give you one-half of all he takes out after the wash-up. You have no further bother. He builds his cabin on your claim, hauls all his supplies there, cuts all the wood for mining and domestic purposes, extracts the gravel and washes it, during which time he is his own baker, cook and laundress. He stands all and every expense, and works from daylight till dark besides.

When the water prevents him extracting any more gravel he builds the dam and provides the sluice-boxes and washes the dirt. You get one-half the gross yield. Of his half he never bothers so long as he has enough to buy an outfit for the coming season and to have a "hot time in the old town" for a day or two. Hence the business men of the town, who all own claims, have a rather fat thing with the Yukoner, who asks no commiseration and is not afraid to work.

ALF. TREGIDGO.

Aids to the Cyanider.

Written for the MINING AND SCIENTIFIC PRESS by
MATT W. ALDERSON.

In the following the aim has been to avoid all technical terms and to make everything so plain that it may be easily followed by anyone. Time is always of value, and in my own work I have sought to simplify matters so that mill employes could be trained quickly and easily to make such tests as might be necessary and record their conclusions without the aid of more experienced technical skill in charge, thus leaving the chemist free for more important duties. The tests, etc., given are not, therefore, such as the educated chemist might choose for making accurate determinations, but are short-cuts and time-savers for busy men. No originality is claimed, the aim being simply to show how certain well known facts may be utilized to advantage in everyday work.

Assaying Solutions.—Where the practice of determining the gold in solution is by evaporating the fluid, it will be found of advantage to make forming blocks for the leaden trays. Sheet lead c. p., for evaporating purposes, comes in various shapes. A very convenient kind is in rolls 2½ inches in width. For this size make a block 1½ inches in width by 3 to 4 inches in length. Lay this crosswise of the sheet lead to be cut and you have a convenient measure; all your trays will thus be same width, the block acting as a guide for penknife in cutting the material. Now make another block, 1x2½ inches. Over this fold the piece of sheet lead, pressing the corners together in the form of a triangle. If a little care is exercised in bringing corners together evenly, the tray when completed will be of nearly equal height on all sides and hold fluid full to the brim. You now have an oblong tray, similar in shape to a housewife's basting pan, but with projecting corners. Press these corners together closely with knife or spatula, so when the fluid is evaporated in the tray no lurking moisture will remain in the corners to cause sputtering when the trays are folded up and put in the cupels. A very convenient quantity of the solution to evaporate down is two assay tons. Take a 50 cc. cylinder and fill with two assay tons of solution. Mark with a file where the fluid stands and you have a convenient measure for future work. Evaporate down on a stove or over any convenient flame, boiling lively. Add silver, if you wish to ascertain gold only, cupel, part and weigh. If fifty divisions on the beam of your assay balance correspond with one milligram weight in the pan, then each division on the beam will mean one one-hundredth of a milligram for your gold button. The advantage of using two assay tons of solution, then, is that in weighing no calculating is necessary. You have simply to register the actual reading of the beam.

Assaying Cyanides.—Weigh out five-hundredths of an assay ton. Scorify with test lead and a little borax glass as usual. Note the weight of the gold in milligrams and fractions thereof. Multiply each milligram by twenty, and you have the value in dollars and cents of each pound of your precipitates. You can thus, by multiplying the pounds, dry weight, of your cleanup, quickly determine its value.

Testing Strength of Solutions.—Nearly all works on cyanide and records of practice in South Africa and elsewhere refer to strength of cyanide in per cent. In actual practice it will be found a great convenience and saving of time to make all calculations by

ONE SET TUTTHILL PATENT WATER WHEELS, 550 H. P., WITH WALL BOX, FLY WHEEL AND CASING; TOP REMOVED AND GOVERNOR CONNECTED IN PLACE.

the Southern Cal. Power Co. has about finished its work in Santa Ana canyon, designed to transmit electrical power to Los Angeles, a distance of 81½ miles. Here it is designed to carry the water through a tunnel 11,000 feet in solid rock, thence flume it 4000 feet, carrying it into two 30-inch lap-

ton is raised the water is shut off and when the piston lowers the water is turned on.

The water enters the bucket at a point just inside of its edge and is deflected by an increased angle, the idea being to have the whole stream concentrated, with sufficient velocity left to control the dis-

FOUR SETS TUTTHILL PATENT WATER WHEELS AND RECEIVER IN COURSE OF ERECTION AT THE SAN GABRIEL ELECTRIC CO.'S POWER STATION, AZUSA, CAL.

welded steel pipes, 2200 feet in length, giving it a 50-foot head.

The San Gabriel Electric Co. is also engaged in a work of great magnitude, and is transmitting power into Los Angeles from the San Gabriel river, 23 miles, at 16,500 volts. The water power plant is now installed at the foot of the San Gabriel canyon, near Azusa, Cal. It comprises eight Tutthill impulse water wheels, made by the Oakland Iron Works, Oakland, Cal., and illustrated herewith.

There are four units, the wheels working in pairs, two wheels for each shaft. They are 48 inches diameter and receive water from two 3½-inch diameter nozzles, two wheels and two nozzles for each shaft. The shafts are 6½ inches, 12 feet long, a 5000-pound flywheel being placed on each shaft to facilitate governing. The couplings are of the leather link type. The casings are sheet steel, angle iron frames with

charge. The high efficiency guaranteed the San Gabriel Electric Co. by the Oakland Iron Works is noticeable. At the tests made the wheels developed from 82 to 85% of the theoretical H. P. of the water used. Under favorable conditions they have obtained as high as 90% efficiency and they say they will contract to deliver the same efficiency under like conditions.

A Practical Miner in the Yukon Region.

TO THE EDITOR:—There are creeks in the valley of the Yukon where ground sluicing or even hydraulicking can be carried on during the summer months, notably Ten-Mile creek, off Sixty-Mile river, and portions of Sulphur creek, but the majority of the creeks are so very flat that in my opinion they can only be worked during the winter season, and the

the pound. Perhaps there is no one with sufficient intelligence to cyanide ore or tailings who does not know that 1 per cent of 2000 would be 20, and who could not calculate the fractional part of a per cent when he had to; but why do a lot of unnecessary work, when one may save time and liabilities to make mistakes by a much shorter system? In making up the nitrate of silver solution for testing strength of cyanide solutions, use 6.535 grams of nitrate of silver to 1 litre of pure water. Take 10 cc. of the cyanide solution and the amount of silver solution used from the burette will tell in pounds and tenths of a pound the quantity of cyanide it contains, each cc. in the burette representing a pound. From this it will be easy to figure the number of pounds of cyanide needed to bring any solution up to the desired strength. Where there is liability of cyanide solutions being fouled by arsenic, etc., and, in fact, in general practice in many places, the use of potassium iodide as an indicator will be very helpful. For this purpose, add 5 grams of potassium iodide to 200 cc. of pure water. Get a medicine dropper, and before titrating your 10 cc. of cyanide solution, add two or three drops of the iodide solution. The reaction is more marked with than without the indicator and is of advantage accordingly, especially when one is running weak solutions. In testing solutions very weak in cyanide, take 20 or 50 cc. of solution, instead of 10, and divide by the number of tens used.

Calculating Quantity of Solutions.—Do not attempt to figure the amount of your solutions in gallons. On the contrary, take the area of your vat and calculate its capacity in tons. This is easily done, as each cubic foot of solution weighs 62½ pounds. Figure out, then, the number of inches in depth of your vat necessary for one ton, and base all calculations on tons and decimal parts thereof.

Test for Alkaline Sulphides.—All works on the cyanide process have considerable to say about ores and tailings of an acid character, needing to be neutralized before they can be successfully handled by cyanide; but only one makes more than a bare mention of those of an alkaline nature. All the accumulated tailings in Montana, unsuccessfully treated until the past few years, contain alkaline sulphides to a greater or less extent. The following will be found a very simple, delicate test for determining their presence: To five cc. of the cyanide solution add one drop of dilute nitric acid (one part acid to three parts water). If alkaline sulphides are present, the acid will impart a milky appearance to the solution. If the strength of the cyanide solution is in excess of one-half pound of cyanide to the ton, more nitric acid will be needed to neutralize the alkalinity and bring about the reaction. With such solutions it will be well to take 50 cc. and add drop by drop of c.p. nitric acid until the end point is reached.

Testing for Copper.—In testing for copper with ammonia, do not be certain there is no copper present until after you have filtered the solution. Of course, a chemist would not neglect such a precaution, but the ordinary cyanide man, or prospector, whose knowledge of chemistry is limited to such chemical tests as can be made quickly, and without excessive care, is liable to deceive himself to his sorrow. The above mentioned test is made by digesting the ore in nitric acid, diluting with water and filtering the solution, then adding ammonia. If copper is present, the solution will have an intense blue color. But ammonia is a precipitant of many other metals, which, if present, may conceal the blue color, unless the above suggestion to filter is observed.

Simple Test for Antimony.—Antimony exists in two forms in Montana ores—one where it is chemically combined with sulphurets and acts as an effectual bar to the successful extraction of gold without breaking the combination by roasting the material, and the other where it is taken into solution by the cyanide, thus causing a greater or less consumption of this valuable aid to the recovery of the precious metals. I believe Park is the only author who makes any mention of this objectionable character in antimony. He says: "The presence of a small percentage of antimonite (the grey sesqui-sulphide of antimony) in the large accumulation of tailings at Boatman's creek, near Reefton, is said to have caused all attempts to treat them to end in failure, chiefly owing to the large consumption of cyanide and the low rate of extraction." (The Cyanide Process, Park, p. 13.) There is at least one tailings pile in Montana where the consumption of cyanide is in excess of five pounds to the ton, principally because of this objectionable element, and it no doubt occurs in isolated instances elsewhere. A simple test for its presence, in either form, is as follows: To 5 grams of pulverized ore, dried perfectly, add 20 cc. aqua regia (made by adding one part nitric acid to two parts hydro-chloric acid); stir thoroughly for, say, fifteen minutes, with glass rod. Let stand, and, when settled, decant the fluid. To this add water. If antimony is present a light, liver-colored precipitant will be thrown down.

Requisite Strength of Cyanide Solutions.—The consumption of cyanide, in treating any material, depends more on other metals susceptible to the solvent action of cyanide than on the amount of gold to be dissolved. In the language of Furman (A Manual of Practical Assaying, p. 408): "For every part of

cyanide rendered inoperative, a corresponding proportion of metal enters solution." Herein is a suggestive fact in determining the strength of cyanide solution which it will prove of advantage to use. Authorities generally advise laboratory tests with solutions of strength running from .25% to 1%, such one of the strengths used to be chosen as produces the best results. It will be apparent that in following this line of suggestion one may easily be led to adopt a strength of solution far in excess of the amount actually needed for the work in hand. To illustrate: Suppose in the tests the two weak solutions contain .25% and .5% respectively, the first does not secure a satisfactory extraction and the latter does. Then a .5% solution is adopted. This means ten pounds of cyanide to the ton of solution. In the other test but five pounds were used. We will suppose that five pounds were not enough to secure good work, but that six pounds would be; then, if the ten-pound solution is used, the solution is of considerably greater strength than necessity requires.

Prof. Christy says (MINING AND SCIENTIFIC PRESS, Feb. 6, 1897): "A ton of solution of .01% potassium cyanide solution contains thirty times as much as is needed to dissolve \$3 worth of gold in a ton of ore." And Scheidel says (The Cyanide Process, p. 17): "In accordance with Elsner's equation, 10 parts of cyanide should dissolve 15.12 parts gold." In 1895 W. A. Caldecott made a series of working experiments on five vats of thirty-four tons each, the treatment being exactly the same except in the strength of cyanide employed. The strengths used were 1.4 lbs., 2.8 lbs., 9.5 lbs., 26.6 lbs. and 86.6 lbs. After three days of percolation and contact, the solution was drained off and water-washing was applied to displace remaining cyanide solution. Mr. Caldecott says (The Proceedings of the Chemical and Metallurgical Society of South Africa, Vol. 1, p. 294): "The highest assay of the residues was seventeen grains and the lowest fifteen grains; this difference of two grains may be attributed to experimental error. Hence it appears that with little more than three days' treatment the same percentage of gold was extracted by a .052% solution as by a 4.334% solution from the tailings of a typical Rand Co." Mr. Caldecott concludes that the explanation is found in the fact that, according to Elsner's equation, for every pound of potassic cyanide actually used in the dissolution of the gold, an ounce of oxygen is required, and if working solutions contain as much oxygen as ordinary water, a solution containing but a quarter of a pound of cyanide would serve to dissolve 6 ounces of gold, .66 ounces of cyanide being required for each ounce of gold dissolved.

Undoubtedly a very small quantity of cyanide would win the gold but for other interfering metals. In a large number of working experiments on ores very susceptible to cyanide and other cyaniding ores containing refractory substances which caused a large consumption of cyanide, I have never failed to secure a good extraction where the strength of the solution, after the original consumption, was as great as one pound of cyanide to the ton of ore. On the most susceptible ores, where one could easily get at least 90% of the gold contents in solution in three hours of agitation, I have never been able to depend on securing a good extraction with a solution of less strength than one-half pound to the ton, though I would not be surprised if such ores exist.

The usual theory is that the readily soluble gold and silver are the first to be attacked by the cyanide. It is a question if, in actual practice, it will not be best to reverse this proposition. One is certain not to make a good extraction of the gold so long as the other metals present continue to cause a consumption of cyanide. Make a test, therefore, of the ore for the amount of cyanide it consumes. If the ore contains few minerals which render part of the cyanide inoperative, then a one-pound solution will do as good work and practically in as short a time as any other strength, providing, after the solution has been applied, such proportion of the cyanide has not been decomposed as will bring its continued working strength below six-tenths of a pound. If the ore is of such refractory character that several pounds of cyanide are consumed per ton, then it will be well to have the cyanide not less than one pound per ton, after the initial consumption, to be sure of a good extraction. It is a peculiar fact that a stronger solution will be needed to secure a good precipitation in the zinc boxes, also, where the consumption of cyanide is great, because of the interfering metals carried in solution, though, generally speaking, perfect precipitation can be had from any solution by the use of zinc shavings where the solution contains as great a quantity of free cyanide as half a pound to the ton, all authorities to the contrary, notwithstanding.

Plan to Measure the Earth.

It is now proposed to measure the earth. The longest arc at present known is 89 deg. 32 min. in length. The southern termination of this arc is in latitude 45 deg. 20 min. 2 $\frac{2}{3}$ sec. This termination is marked by a pyramid of cast iron which rests on a cube 7 feet wide, bearing an inscription showing what the monument really is. The northernmost limit of this arc is at Hammerfest, in Norway. Every man who navigates a ship figures out his

course each day upon a basis of longitude and latitude which in turn depends upon the arcs of meridian. If the measurement of that arc be in any way wrong, the course of the vessel will err accordingly, and it takes but a trifling variation to so steer a ship that she will strike a charted obstruction. Every survey that is made to make the arcs of meridian more accurate, simply renders the liability of ships meeting with disaster just so much less in corresponding degree.

The first operation under the new plan will depend primarily upon the measurement of a base line some miles in length, upon the most level stretch of land available. A base line is a point of beginning. The laying down of a base line is a tedious and delicate process, for even if the line be seven or eight miles long, it must be perfectly straight, and its length ascertained to the inch. One of the greatest difficulties to be faced is the difference in the length of the measuring rods used by the surveyors, because changes of temperature as a rule make the rods longer or shorter, the slightest difference in a matter of this sort making eventually a very great difference.

The present measuring rod in use is calculated to overcome this annoyance to a certain degree. It is formed of a bar of brass firmly joined at its center to one of iron. Pivoted at the ends are a pair of projecting metal tongues, certain marks on which remain at a constant distance, because the expansion of one rod pushes them apart just as much as that of the other endeavors to bring them nearer together. Such rods cannot be put in contact end to end, and they are, accordingly, placed a constant and known distance apart by means of a pair of microscopes which are joined together by means of compensation bars. Sights and levels to insure the straightness of the line complete the essential parts of the apparatus.

The work of measurement is carried on in a series of triangles, and these triangles, being joined, constitute the arc. Therefore, the arc is really not a single line. Surveying degrees of meridian is not so widely different from surveying anything else. First, a base line is secured, and no survey is attempted without a base line or a point from which to start. Then at each end of this base line are placed accurate theodolites.

At each end, the angle between the base line and the object which may be sighted through both theodolites is measured, and it is easy enough to calculate the distance of the object from either end. The triangle is now formed and its sides may serve the same purpose as the original base line. By this system, which is called triangulation, the measurement is carried on to any desired extent, being checked here and there by the actual laying down of new base lines, the length of which have been previously determined in the course of the surveys.

"Ore in Sight" and "Estimated Ore."

"Promoter" questions concerning the value of the ore below the horizontal dotted lines in the suppositional instance illustrated in the accompanying sketch. He assumes for purposes of discussion that the average width of the vein is 7 feet and the average value of the ore \$7 gold per ton of ore.

The question of "ore in sight" and "estimated ore" is always a live one to miners and mining engineers. It is nearly always a problem in the examination of a mine, and one on which buyer and seller often hold widely variant views. The real problem in such a case as the one herein indicated is, Where shall one draw the lines determining the

boundaries of ore which may be termed "estimated" ore, or ore probably available for mining? It is not essential that the thickness of the ore body be considered, as the query is really one of area. It is this indeterminate quantity of ore that in many cases determines the value of the mine.

Shall we assume a length of ore outside of the proven ore body proportional to the thickness of the ore? To illustrate: If the ore is 2 feet thick (average), then may we assume that ore will extend 50 feet below a proven zone? If an average of 3 feet thick, 75 feet below?

The value of a mine is based upon the net amount one can safely figure the mine will yield in a reasonable period—that is, where one leaves the realm of speculation and considers mining as a legitimate business. It is an interesting subject of general practical value, and one to which these columns are open for discussion.

Coast Industrial Notes.

—The engineers of the S. F. & S. J. V., Cal., road are inspecting the Tejon pass.

—At Biggs, Cal., 550 acres of hemp this year has yielded the growers from \$120 to \$200 per acre.

—Near Fresno, Cal., a body of land comprising over 25,000 acres is being planted in wheat.

—The Northern Pacific R'y Co. has reduced its passenger rates 20 per cent in the State of Washington.

—Coast lumbermen have advanced the price of lumber from \$9.50 and \$10 per M to \$11, cargo delivery.

—English purchasers have secured the Coal-Ingalls wells of Fresno county, Cal., for a locally stated price of \$300,000.

—The citrus fruit crop of southern California for the season amounts to 15,000 carloads, representing \$4,000,000.

—The stock of oil on hand Oct. 1 in the Los Angeles field and in storage was 16,000 barrels less than on Sept. 1.

—A \$25,000 paper manufacturing plant is to be erected on the Truckee river, twenty miles from Reno, Nevada.

—Track is laid on the Visalia, Cal., division of the Valley Road to Corcoran Junction, twenty-four miles from Visalia.

—The Oregon Short Line will lay 10,000 tons steel rails on the main line from Glenn's Ferry, Idaho, to Huntington, Or.

—Custom house receipts in San Francisco the first week of October were \$91,095.08, a total since January of \$4,637,704.32.

—The value of five exportations of bananas from Merida, Mexico, in August to New Orleans, New York and Hongkong amounted to \$1,606,088.40.

—Three hundred tons of grapes on the vines in Santa Clara Co., Cal., have been sold for \$6 a ton. That price is considered equal to about 15 cents a gallon for wine.

—The Stockton & Tuolumne County, Cal., Railroad Co. will issue bonds to the extent of \$1,000,000, payable forty years after date and bearing 6 per cent interest.

—Track laying on the Utah & Pacific Southwest from Milford to Pioche, Nev., was begun on the 11th. Pres. McCune says it will never be stopped until the road gets to the Pacific.

—The Esquimalt & Nanaimo railway has been extended to Oyster Bay, eleven miles from Nanaimo, B. C. The shipments of coal during August from Vancouver island were 75,700 tons.

—The Southern Pacific Co.'s new ferryboat Berkeley, which has been building at the Union Iron Works, will be launched next Tuesday. She has a seating capacity for 1700 passengers.

—The controlling interest in the Spokane & British Columbia Telephone and Telegraph line from Spokane, Wash., to near Rosland, B. C., was sold last week to O'Brien, Reddin & Co. for \$255,000.

—The engineering work on the Sacramento river, Cal., undertaken by the Commissioner of Public Works, is progressing. The five dikes at the Newtown shoals and the overflow weir at the mouth of Feather river are nearing completion.

—The Government of New Zealand offers a prize of \$10,000 for improvements in the process of treating the native fiber (*Phormium tenax*), or New Zealand flax. The successful competitor will not be required to surrender title to his invention.

—Bids have been asked for by the Interior Department for work on the Buttes reservoir in Pinal county, Arizona. The construction of this dam means the conserving of water sufficient to reclaim more than 300,000 acres in the valleys of the Gila and the Santa Cruz.

—The Territory of Hawaii, U. S., has authorized the sale of \$300,000 of bonds to erect and improve the system of water works. Bids for the construction of the pumping works and for the necessary water pipes and mains will be asked from constructors and manufacturers on the coast.

—Stockton, Cal., reports an increased flow of natural gas, which is to be utilized to operate gas engines, which in turn generate electricity for light and power service. The cheapness of this natural gas has also reduced the cost of fuel. Numerous wells have been sunk of late, but the supply does not seem to diminish.

—The Pacific Car Equipment Company has incorporated in San Francisco, capitalized for \$250,000, of which \$233,000 has been subscribed by J. H. Thompson, \$75,000; A. C. Rumble, \$75,000; W. D. Huntington, \$30,000; R. Gorrell, \$10,000; M. L. Requa, \$10,000; G. H. Strong, \$10,000; F. W. Fry, \$20,000; H. L. Huntington, \$20,000.

—At Tacoma, Wash., the Tourist Hotel, under construction by the Northern Pacific Land Co., was burned on the 11th inst. There had been expended on the structure up to date \$600,000. On Sept. 20th the Tacoma Exposition building burned, with a loss of \$120,000; Oct. 2nd the Tacoma woolen mills burned, with a loss of \$30,000.

—The recording at San Bernardino, Cal., last week of a trust deed from the Pacific Borax & Redwood Chemical Works to the Indian & General Investment Trust of London, to secure a second mortgage of \$750,000, was the close of the recent deal which transfers the works from Alameda Co., Cal., to the Atlantic side of the continent.

—The construction of the jetties at the Newtown shoals, on the Sacramento, Cal., river, near Rio Vista, will soon be completed. The work has been done by the Commissioner of Public Works in accordance with plans approved by the War Department. It consists

of a series of wingdams so placed as to concentrate the flow of the river. The effect, it is believed, will be to greatly increase the scouring action of the current, so that the deposits of sand and silt which compose the shoal will be cut away.

—Gov. Brady of Alaska, who has returned from an official tour of the Pribilof islands, says of them and of the Aleutian islands: "They are destined to become the home of countless herds of cattle and sheep. Some of the islands have not a stick of timber on them, but are covered all over with a luxuriant growth of grass, affording the finest kind of pasture land for cattle and stock."

—The contract for building the Central Railway of Coahuila, Mexico, has been awarded to the Coahuila Central Construction Company, Mexico City. Sixty-two miles of standard gauge road will be laid with 55-pound rails. The company, according to the report from Mexico, will also build a hotel and smelter at Saltillo, for which valuable concessions have been granted by both the Federal and the State Governments.

—It is again asserted that arrangements have been perfected between the North German Lloyd's Steamship Company and the Atchison, Topeka & Santa Fe system of railways for a through line by rail and steamer from New York via San Francisco to Japan and China, and that the extension of the S. F. & S. J. Valley road from Bakersfield to Los Angeles, Cal., will give a through line independent of the Southern Pacific system from New York to San Francisco.

—Electrical power from the Sooke mountains, eighteen miles distant from Victoria, B. C., is completed. The water from the mountains starts 2300 feet above the level of the sea, and is the highest fall in Canada. About 700 feet above sea level, and sixteen miles from Victoria, these waters form a lake covering 150 acres, into which empties Goldstream river, which is tapped three miles from its source by an artificial lake or reservoir, covering $\frac{7}{8}$ acres, 1122 feet above sea level. From this reservoir the water passes through a steel pipe, 33 inches in diameter, 6700 feet to the power house of the electric company, which is 460 feet above sea level, thus giving a fall of 1000 feet from the main lake, supplying 1500 H. P.

—According to the new treaty of commerce and navigation between Japan and the United States of America, the subjects or citizens of each country shall have liberty freely to come with their ships and cargoes to all places, ports or rivers in the territories of the other, which are or may be opened to foreign commerce. Osaka is a distributing center for merchandise in the central part of Japan, and absolutely controls the local trade in the southwestern part of the empire, but cannot be considered the most important export port. The new treaty is to go into operation July 17th, '99, and to remain in force for a period of twelve years thereafter; but either party shall have the right to give notice to the other of its intention to terminate the agreement, and at the expiration of twelve months after such notice is given, the treaty shall wholly cease and determine.

—The Hawaiian Commercial & Sugar Company has decided not to increase its capital stock from 100,000 to 150,000 shares, as was proposed. A detailed report last Thursday states that the total liabilities are \$644,466.52, including operating expenses of \$140,000 until December 31, 1898, \$256,491.52 liabilities matured and \$247,975 liabilities incurred, part of which will not mature until June 30, 1899. The assets amount to \$357,264, including \$349,564, the market value of 4976 tons of sugar afloat, at \$70.25 per ton. On January 1, 1899, after having paid all expenses of operation of every kind up to that time and after setting aside sufficient money to pay for all the improvements authorized by the stockholders at their last meeting, the company will be in debt \$287,202.52. The new crop of sugar, estimated at 17,000 tons, will then be ready for milling. The value of this crop is estimated at the present price of raw sugar at \$1,194,250.

Personal.

A. A. ANTHONY becomes Gen. Mgr. Central mine, Whitehouse, Cal.

J. JOSEPH, Supt. Gerry-mander mine, Sonora, Cal., is in San Francisco.

L. MAYER, Supt. Ghost mine, San Andreas, Cal., is in Ottawa, Canada.

A. H. MELIN has been appointed Gen. Mgr. Washoe M. Co., Butte, Mont.

H. PENGALLY has been appointed Supt. Orleans mine, Grass Valley, Cal.

D. HUNT, Supt. Niagara mine, French Gulch, Cal., is in San Francisco.

DAV. R. OLIVER, part owner Bonanza mine, Sonora, Cal., is in San Francisco.

J. SCRANTON, part owner Black Bear mine, Shasta, Cal., is in San Francisco.

P. REDDY, San Francisco, is visiting his mining properties at Darwin, Cal.

JAS. W. ABBOT, M. E., has returned from Portland to Grant's Pass, Oregon.

M. THOMPSON succeeds G. W. Delamater as Supt. Tripp mine, Hillsboro, N. M.

F. H. HALL of San Francisco is examining mining properties near Shasta, Cal.

WM. YORK becomes Supt. Spanish Bar gravel mine, Mokelumne Hill, Cal.

CAPT. THOS. COUCH of Montana is examining properties near Grant's Pass, Oregon.

JOHN HAYS HAMMOND is now consulting engineer to the British South Africa Co.

W. H. HOLMES of the United States National Museum is visiting Calaveras Co., Cal.

A. WEARE, Supt. Mt. Shasta mine, Shasta, Cal., has returned from San Francisco.

L. RUEL of the Roessler & Hasslacher

Chemical Co., New York, is in San Francisco on his semi-annual Western trip.

R. MARTIN, part owner Mayflower mine, Nevada City, Cal., is in San Francisco.

F. L. PICKET of Philadelphia is inspecting his mining properties at Phoenix, Ariz.

G. MAINHART, Supt. Omaha Con. mines, Grass Valley, Cal., is in San Francisco.

H. W. WINCHELL, geologist of the Anaconda mine, Butte, Mont., is at Deadwood, Cal.

B. McDONALD, Supt. Alameda mine, Jamestown, Cal., has returned from San Francisco.

G. MC. ROSS, Supt. Con. Cal. & Virginia mines, Virginia, Nevada, is in San Francisco.

E. D. EASTON of the Young America gravel mine, Graniteville, Cal., is in San Francisco.

J. THOMAS, Supt. Central Eureka mine, Sutter Creek, Cal., has returned from San Francisco.

J. FRED. HUME Minister of Mines for British Columbia, has moved from Nelson to Victoria, B. C.

C. D. CRANE, Supt. Oro Fino mine, has returned to Grant's Pass, Oregon, from Spokane, Wash.

A. J. BOWIE is again on his way to Dawson City. This time he takes with him an electric lighting plant.

J. RICHARDS, Placerville, Cal., managing owner Hill Ranch mine, El Dorado, Cal., is in San Francisco.

P. STOLBERG, part owner Shurtliff Hill mine, Shasta, Cal., has returned from San Francisco to the mine.

S. B. MILNER, Mgr. Dexter M. Co., Tascara, Nev., has returned from the East to Salt Lake City, Utah.

J. A. FISHER, Pres. Golden Gate M. Co., Jamestown, Cal., has returned to San Francisco from a visit to the mine.

H. E. PICKET, Mgr. Grand Victory mine, Placerville, Cal., has returned from Pennsylvania and is in San Francisco.

W. H. HUSBANDS, Supt. Gopher-Boulder mine, Kelsey, Cal., is in San Francisco en route home from Los Angeles, Cal.

J. B. ELDERIDGE of Alameda, Cal., has returned from Jacksonville, Oregon, where he has been examining mining properties.

D. KIETH, managing owner Silver King mine, Park City, Utah, has returned to Salt Lake City from an extended Eastern trip.

A. L. COLLINS has been appointed Gen. Mgr. of the Gregory Con. Mines Co., and of the Gold Coin Mines Co., Central City, Colo.

A. H. LEBECK, who has been operating a mining property for a company in Peru, S. A., has returned to his home at Park City, Utah.

J. B. HAGGIN of New York is at Anaconda, Mont., conferring, it is locally stated, with Marcus Daly, relative to the erection of the new copper reduction works of the Washoe Co.

WM. B. PARSONS sails on the next steamer for Hongkong, accompanied by four assistant engineers, to begin a survey of a railway between Hongkong and Hankow, 600 miles. This road will be built by Americans, who have obtained a concession from the Chinese Government.

Recent California Mining Incorporations.

Homestake M. & M. Co., San Francisco; capital stock \$300,000, subscribed \$107,000; F. E. Sohl, A. Johnson, O. Olsen, A. Edlund, G. Olson.

Sheep Train & Minnie Con. M. Co., San Francisco; capital stock \$100,000, subscribed \$5; W. Bowers, T. Cole, C. Mau, W. Bannon, R. R. Grayson.

Lost Log M. Co., San Francisco; capital stock \$115,000, subscribed \$50; E. J. McCutchen, H. G. Stevenson, J. C. McBride, A. H. Wina, P. S. Muller.

Marguerite M. Co., Placerville; capital stock \$107,000; P. Maul, W. W. Tenney, C. H. Dutton, G. Lilly.

Royal Group G. M. Co., Los Angeles; capital stock \$2,000,000, subscribed \$60,000; E. E. Bowles, A. A. Bowser, G. R. Wyson, N. R. Schooley, S. E. Thomas, L. H. Renkert, H. C. Brinker.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING OCTOBER 4, 1898.

611,986.—ASSAYING APPARATUS—W. H. Adams, Los Angeles, Cal.

611,765.—ALMOND HULLER—J. E. Beach, Routier, Cal.

611,674.—CARBURETOR—H. T. Bradley, Oakland, Cal.

611,888.—FIRE ESCAPE—Britt & Enns, Dallas, Or.

611,694.—TRUCK—Brown & Burns, Jerome, A. T.

611,769.—WATER WHEEL—J. D. Campbell, Magalia, Cal.

611,770.—OVEN DOOR—Chadwick & Clarke, S. F.

611,782.—TREATING DRIED FRUIT—W. Forsyth, Fresno, Cal.

611,738.—ALARM CLOCK—F. Gundorph, S. F.

611,902.—FUNNEL—Sarah A. Hess, Haynie, Wash.

611,758.—BICYCLE LOCK—C. H. Melquiond, Oakland, Cal.

612,006.—ANIMAL EXTERMINATOR—C. K. Myers, Stockton, Cal.

611,940.—STATION INDICATOR—Reynolds & Turner, S. F.

611,874.—WATER MOTOR—W. Turner, Wenatchee, Wash.

611,877.—BALLAST UNLOADER—H. H. Warner, Tacoma, Wash.

611,851.—GEAR CUTTER—N. A. Wheeler, Stockton, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

OVEN DOOR.—Messrs. Chadwick & Clarke, San Francisco, Cal. No. 611,770. Dated Oct. 4, 1898. This invention consists essentially in the employment of a plurality of openings made through the door of an oven with transparent covering plates, and a means for supporting and fixing the plates in position so that an evenness of expansion and contraction is effected while the interior of the oven can be easily inspected at any time without opening the door to allow currents of air to enter the oven. By our means of supporting and fixing the glass we prevent its fracture by currents of varying temperature striking different portions of it. The door has spaced vertical and horizontal ribs forming channels into which are placed packing strips of some material which will not be affected by heat, the glass resting in contact with these strips having the angles cut away and bolts are cast into the door plate, projecting so as to receive nuts by which the whole is clamped together.

BICYCLE LOCK.—Cyr H. Melquiond, Oakland, Cal. No. 611,757. Dated Oct. 4, 1898. This invention is intended to lock the revolving parts of a bicycle to make it impossible to carry away the machine surreptitiously. It consists of a block or support fixed within the saddle post, having an upper and lower arm provided with guides, a cylinder movable in the lower guide and provided with a bolt extension which engages a corresponding socket in the crank or pedal shaft. A rod is slidable in the upper guide and has its lower end acting as a piston in the cylinder previously described, while its upper end, bent to one side, passes through a slot in the saddle post so that its end is convenient for moving the parts. A spring within the cylinder is pressed upon by the plunger upon the slidable rod so that when the rod has been pressed down it forces the cylinder and the locking bolt downward, and when the shaft has been rotated to bring the slot in line with the bolt the spring causes it to engage; a pawl is so arranged with relation to a lug on the actuating rod that it will engage with said lug and holds the parts in position to be locked until the pawl is disengaged by a key carried for that purpose.

ALMOND HULLER.—J. E. Beach, Routier, Cal. No. 611,765. Dated Oct. 4, 1898. This invention relates to an apparatus for cleaning, hulling and separating almonds. It comprises a series of rotary cylinders made of wire screen or covering work peculiarly arranged so that one forms a cleaner and a second a huller, while the third separates the almonds from the hulls before they are delivered to a carrier or other point of deposit. The cleaning cylinder has its periphery formed of spirally coiled wire with interstices for the escape of the dirt, while the hulling cylinder has a periphery of wire netting and is formed with a converging flange at its receiving end into which the nuts are delivered from the cleaning cylinder. Within this hulling cylinder are a series of arms having their outer arms bent into lips turned backwardly and susceptible of rotation in the same direction with the cylinder, but at a different rate of speed, so that the hulls are stripped from the almonds and all are delivered into a vertically disposed chute at the lower end, the huller being inclined for this purpose, and from the chute they are again delivered into another inclined wire cylinder having a peculiar arrangement of network, zig-zag arranged wires through which the hulls may pass and leave the almonds to pass out of the apparatus.

WATER WHEEL.—John D. Campbell, Magalia, Cal. No. 611,769. Dated Oct. 4, 1898. This invention relates to a water wheel having peripheral buckets and means for applying the weight and momentum of a column of water to the buckets carried by the wheel so as to rotate it. It consists of a wheel having depressions in the face of the rim within which the buckets are seated and a stationary enclosing casing within which the rim of the wheel turns and within which the buckets are enclosed during a portion of the revolution of the wheel; an extension of the enclosing chamber into the line of the nozzle through which the water is delivered, and a means whereby the buckets are opened out into this extension so as to receive the pressure of the water while passing through it, and a means by which they are again retracted into the rim after passing beyond the discharge opening. By this construction the buckets are exposed to the full pressure of the water when opened out during their travel through that portion of the rim having the large diameter and are closed into the periphery of the rim after passing the point of discharge.

Recently Declared Mining Dividends.

Pennsylvania, California, 5 cents per share, \$3575; payable immediately.

Silver King, Utah, \$37,500; payable Oct. 15.

Mercur, Utah, $\frac{1}{2}$ cents per share, \$25,000; payable Oct. 20.

Bullion-Beck, Utah, 10 cents per share; payable Oct. 20.

Portland, Colorado, 2 cents per share, \$60,000; Oct. 15.

Anchorage-Leland, Colorado, 1 cent per share, \$6000; Oct. 15.

Vindicator, Colorado, 5 cents per share, \$75,000; Oct. 10.

Mountain Copper Co., California, $\frac{6}{8}$ cents per share; Oct. 15.

Associated G. M. Co., Colorado, 1 cent per share, \$12,500; Oct. 10.

Large High Speed Water Wheel.

Herewith is illustrated a large tangential water wheel manufactured by the Risdon Iron Works of San Francisco, made entirely of steel except the hub, 30 feet in diameter, running sixty-five revolutions per minute. It is designed to transmit 330 H. P. with one nozzle or 1000 H. P. with three nozzles, each nozzle being $1\frac{1}{2}$ inches diameter. The wheel operates under a head of 775 feet water pressure. The power is transmitted from the rim to the hub and to a shaft on a duplex single-acting, compound air compressor. This wheel is manufactured under the Cobb patent, August 4, 1896. The total weight is 13,370 pounds. It is now being placed at the North Star mine, Grass Valley, Nevada Co., Cal., where a wheel of similar construction, but much smaller, was put in operation about two years ago. That wheel is $18\frac{1}{2}$ feet diameter, weighs 10,500 pounds, runs at 110 revolutions per minute, under 750 feet head, developing 300 H. P., and giving good service. The novel construction of these two wheels is of interest. It was fully discussed in the issue of August 2, 1896. The unusual diameter—30 feet—of the one illustrated on this page is not the limit of possibility in that direction, as this design of wheel can be made of still larger diameter or rim section, suitable for fly wheels, band wheels, gear wheels or water wheels, of any desired weight, and to travel at any number of revolutions per minute up to 20,000 feet per minute rim velocity.

The wheel shown is made in four sections for convenience of shipment. There are no bending stresses in any of the members, all stresses are tensile, proper strength being provided for by suitable cross section of material used.

The water wheel buckets are of the Risdon's latest patent, dated March 1, 1898, noticeable points being the large area for discharge, and that when the water first enters the bucket it is discharged at the back and gradually brought round to right angles with the stream, thus leaving the bucket with the minimum of perceptible velocity. In this particular wheel, it is to be noted that the buckets are finished on the inside and polished to a smooth surface. The makers of this wheel publish a circular describing tangential wheels in all forms.

Hearing Heat and Cold.

It is now possible to hear heat and cold. G. C. Whipple, biologist of the Brooklyn, N. Y., Water Works, has invented an electrical instrument by which the various ranges of temperature may be heard in an ordinary telephone receiver. The apparatus in external appearance is like an ordinary electric battery box such as is used in sick rooms. From one side of the box extends a long insulated wire, carrying a small coil of bare wire on the end of it. From the other side of the box extend wires which hold a telephone receiver. The latter is to be held to the ear so that the temperature into which the bare coil is thrust may be heard. Heat or cold acting on the bare coil of wire causes an electric current to set up a buzzing in the telephone. When the instrument is used the telephone is held to the ear, while the listener looks at a dial on the battery box, in appearance like the face of an ordinary mechanical thermometer, marked with figures representing degrees of temperature above and below zero. Let us suppose, for instance, that we are to listen to the temperature of a pail of water. The coil of

bare wire is thrust into the water, and the observer places the telephone to his ear. There is a hand or pointer pivoted in the middle of the dial face. The observer proceeds to turn the pointer from figure to figure on the dial. When the telephone is placed first to the ear a loud buzzing sound is heard. This is

Mass., State Capitol corridors at the height of a man's shoulders. If the engineer wishes to know the temperature he has merely to place the telephone to his ear and turn the dial pointer until the buzzing ceases. He then can note the temperature of the building in all its parts without going

LARGE TANGENTIAL FLY WHEEL.

because the pointer does not happen to be at the figure representing the temperature of the water in which the bare coil is placed. As the pointer nears the figure that indicates the correct temperature, the buzzing sound in the telephone becomes fainter until when it comes opposite it, it stops altogether. As soon as the buzzing stops, the observer knows that the temperature of the water has been found.

It is not necessary that the bare

out of the engine room. The instrument is now being used in cold-storage warehouses to ascertain the temperature of the various rooms without opening them.

Gear and Friction Hoist.

The accompanying illustration represents a new Bolthoff gear and friction hoist, manufactured by Hendrie & Bolthoff Manufacturing & Supply Co.,

NEW BOLTHOFF GEAR AND FRICTION HOIST.

coil mentioned above should be in that precise form. It may be straightened out to form a long flexible wire. That the engineer in the basement of the building should know the temperature of every part of it, one of these straightened out coils has been placed behind the wainscoting in the Boston,

Denver, Colo., and which is to be installed at the Ajax mine, on Battle mountain, Cripple Creek district. It is made for power and high speed, having a hoisting capacity of 6000 pounds, and weighs 18,000 pounds. The drum has a 48-inch diameter and a 25-inch face; the friction wheels have a 72-inch

diameter and 12-inch face; the paper frictions are 24-inch diameter by 12-inch face. The gearing is in the ratio of 2 to 1, friction surfaces 3 to 1. The pinion on the engine shaft meshes into the gear on the intermediate shaft to which the paper frictions are keyed. To throw on or off the friction in hoisting and lowering, it is only necessary to move the intermediate shaft. This obviates the necessity of moving the entire drum with its load, leaving drum free to revolve in dropping bucket or cage.

Is Darwinism True?

W. S. PROSSER.
NUMBER VIII.

True votaries of science seek unselfishly, and with open, candid minds, for truth, and that only. Therefore to such I present, with confidence, these arguments—concise, but I hope sufficient.

The chief is that the seventy instances given in the PRESS of April 2, and others, are new ideas—real inventions—whose origin, under the Darwinian or other material plan, is impossible. A just appreciation of this fact is necessarily fatal to Darwinism.

This theory is very vague. It merely guesses that one animal changed into some other, and leaves each person to wade around in his own little mudhole of conjecture as to means and methods.

The three things alleged as causes originating new forms—the yearning of the animal, environment and food—are not worthy of consideration, for the reason before given, that these were the product of ideas of which animals, lower than man, are incapable. Darwinism requires that eyes, ears, legs, wings, brains, nerves, etc., should have been invented by worms, sponges, mollusks and such (not for themselves, but for their remote posterity), yet believers in that theory constantly deceive themselves by failing to put these things in plain language, but begot them by vague and misty words. If the early worm did not invent the marvelous mechanism of bird's wing or fish's tail, two things that men envy but cannot equal, who did? One clear-cut idea is worth an acre of fog. If any answer can be given, outside of idle chat, about "accumulations of heredity," "intermittent pressure," etc., I would be glad to hear it.

Let me give a few of the explanations essayed by evolutionists. The backbone was a necessary part of the original idea of an animal with internal skeleton, and limbs for locomotion; muscles pulling in every direction give strength, nerves to the brain give control, many parts and cushions between give flexibility, the whole forming an ingenious and complete machine. Yet so bright a genius as Herbert Spencer suggested that the "ultimate cause of the segmentation" was "due to transverse strains"!

An address to the American Association for the Advancement of Science by Prof. Packard attempts many explanations: "About this time certain worms, as the simple mechanical result, perhaps, of threading their way over or through the rough, gravelly bottom became segmented." "Following this was the segmental arrangement of the internal organs," etc. "In certain of these primitive protannelids, as the result, perhaps, of external stimuli intermittently applied, bristles originated to aid in progression." "The evolution of jointed limbs was accomplished in the most economical and direct way. The parapodia were, perhaps, utilized and, at first retaining their form in swimming phyllopoda, afterwards from being used as supports became cylindrical and jointed," etc. That is the explanation of the leg and its joints, marvelous and perfect even in the lowest forms. "They became jointed." Compared to this, Jack and the Bean Stalk, or Cinderella, is cold, plain history. It is said that very early—pre-Cambrian—time was a "critical creative period," and "that those early forms were more rapidly evolved, and were more plastic, than forms now existing." And Darwin himself to the same effect. Which amounts to saying that the

most brilliant inventions in animal mechanics were made in an inverse ratio to the capacity of the makers. Another point is that most new forms originated not gradually but suddenly. Prof. Hyatt says of certain mollusks: "These groups originated suddenly." Packard says eight orders of insects originated about "same geologic date" and speaks of the "acknowledged sudden appearance" of all types of invertebrates and nearly all existing and fossil types in the Paleozoic, and that "during the late Paleozoic were evolved the three air-breathing classes of Arachnida, Myriopoda and insects, and also amphibians, reptiles, birds and mammals."

(To be Continued.)

Mining Summary.

ALASKA.

S. G. Dawson has been prospecting on the southeastern Alaska coast and islands as far north as Ketchikan, and says:

"I found the geological summit of the country near the center of Revillagigedo island. Archæan granite crops on the head of Carroll inlet and is overlaid with gneiss and mica schist—really schistose gneiss. This is overlaid by a series of metamorphic slates, talcose in parts, which are cut with quartz stringers, carrying in some instances the precious metals. This seems to be a pocket belt. Following is a series of syenite interstratified with serpentine greenstone. Lying west of this is a strong belt of porphyritic felsite interstratified with syenite and carrying ore veins of quartz with chalcopyrite, marcasite (white iron pyrites) and carrying more or less barite. This belt extends from near Cape Fox northwesterly, crossing Cat, Mary, Annette and Gravina islands, a part of Prince of Wales island and probably extending to part of Baranof island.

"This is the copper ore belt of that section and numerous claims have been staked all along it and assessment and development work is being done. The center of disturbance appears on the south end of Gravina island, where an extinct crater, now filled by a lake of warm water, exists. In this portion of the belt the lower strata are covered nonconformably by belts of clay slates and argillaceous sandstone, altered at numerous points by lavas, which overlie them.

"I had a laboratory kit with me and we sampled a number of veins and located a few claims on Gravina island. The croppings are not very well marked, being generally capped with argillaceous sandstone or altered rocks of one kind or another, so that it is difficult to tell what they are. Where these cap rocks are found to be very much oxidized with iron stains, sulphide ores are found by sinking. Marcasite is first encountered, then barite with chalcopyrite and blende. Ordinarily, to characterize a vein it is necessary to sink 5 or 10 feet. The cap rocks seldom show more than the merest trace of gold.

"On Seal bay, on the south end of Gravina island, ex-Governor Swineford has taken under bond the Anaconda group of half a dozen claims and has men sinking. He has good copper ore. The Dallhead mine, on the south end of Gravina island, consists of six or eight claims, where there are men at work. Recent discoveries of galena ore have been made on the southeast end of Prince of Wales island, the west end of Gravina island, and also galena and pyrrhotite ores on George inlet, on Revillagigedo island. They lie in a syenite belt, which is east of the porphyritic belt I have described.

"The country is easy of access, for you can't get away from transportation. One noticeable fact is that there is almost no fallen timber. To any one who has traveled on the west side of the Cascades that means a great deal. The ground is covered with variegated moss, from 3 to 14 inches deep, which in wet weather acts as if you were walking on a sponge. But no matter how much you get wet, or sleep in wet blankets, you never catch cold, and everybody could eat three meals a day when he could get them."

The Alaska Gold Fields, Ltd., of London are said to have bought for \$1,000,000 twenty-three claims on El Dorado, Bonanza, Dominion, Sulphur and Moose Hide creeks from I. Rosenthal and others, owners.

In the Klondike the old method of thawing the earth with log fires is no longer in vogue. Timber is too scarce and the process does not pay. The method now is to strip off the muck and moss and let the summer sun thaw the frozen soil. It does it nicely and then sluicing can be done in the ordinary way. That is the method of work all over the district, and there will be little doing up there this winter. Some one has a project to bring water around from the Klondike and get a sufficient fall to wash all the benches and the gravel in the richer portion of the district.

Herewith is presented an interview with Mr. Alf Tregido. It illustrates the methods of reaching the diggings and pictures the difficulties of travel, together with the prevailing mode of work pursued by the miners in their search for gold in the north, from the standpoint of an experienced California gold miner:

All the work is done on the mines during the winter. The Yukon river freezes solid in November. Then the miner quits Dawson for the scene of his labors and hauls his belongings over the ice to the diggings. He usually hauls 200 or 300 pounds at a time and has to make several trips to get it all there.

With such a load from fifteen to twenty miles a day is good traveling, and El Dorado creek can be made in a day from Dawson. We will say, for instance, that the "adventurer"—who may either be a lawyer, doctor or layman—arrived on the Klondike during the first excitement in the month of July, 1897, and took up a claim on El Dorado creek. He is fortunate enough to have enough grub to last him and his partner a year. They have been in Dawson all summer, taking care of their supplies, living in a tent, have had no money to spend, and are anxiously waiting for the river to close to get their stuff on their claim and go to work. They arrive at their destination and pitch their tent, in which they place all their belongings and live whilst they hunt over the ridge for logs large enough to build a cabin, which are not at all plentiful. Having found a set and cut them down, they must wait until there has been a snowfall to facilitate hauling them to the cabin site. The cabin is built of logs, in the ordinary way, and "chinked" with moss. The moss, being frozen, must be thawed before using, and as the creek is nothing but muck (decayed vegetation) and the ridges on either side nothing but moss, to find dirt for the roof is quite a job, especially as at this season of the year it is generally snowing and the thermometer away below zero. While the cabin is being built one of the partners is off cutting wood and hauling it over the snow to the point in the creek where the shaft is to be sunk, usually near the cabin. In course of time the "house" is completed and occupied, and with plenty of grub and wood on hand everything is in shape for developing the claim. At night the parties whittle shavings so as to start "burning down" in the morning, and early next morning a fire is started on a patch of ground that has been cleared of snow. This fire is made of dry wood, covered by green logs so that it will burn down and as much of the heat as possible penetrate the frozen ground. Generally a foot or so in depth will be thawed by each burning. This muck is immediately shoveled out of the hole and the process of thawing the muck and shoveling it out continued, usually for a depth of from 6 to 10 feet, when gravel is struck. If "colors" are found in the gravel there is great joy in camp, and no time is lost in getting to bedrock. Should good returns be found on bedrock, the news goes all over and by the time it reaches Dawson God only knows how rich they have struck it. A stampede occurs for the diggings and any vacant ground on the creek, or in the vicinity, is soon located, many being willing to forfeit their right of locating a 500-foot claim to have a "fraction" of a few feet near by the recent discovery. In order to hasten the extraction of gravel in creeks where the channel has been developed, it is customary to sink two shafts, one on each side of the creek, from 30 to 40 feet apart, and make a connection on the bedrock. This causes a good draught and at night a big fire is started right across the breast and enough dirt thawed out to keep the men busy all next day hoisting it on top. The man down below has the better job, as standing at a windlass all day, with the thermometer varying between 15° and 150° below zero, is trying. As soon as the bucket of gravel is dumped over the "cribbing" it freezes again and becomes like hydraulic cement concrete. The channel is worked up and down from the openings until the snow and ice, thawing, fill the shafts up with water and prevent further excavation. Very little timbering was done last year, the miners below trusting to the overlying muck being frozen hard enough to remain standing; but in many instances such inexperience caused bitter repentance, as so much dirt was dumped on top, around the shaft, as to cause a total collapse of the muck and the loss of all their winter's work—distressing in the extreme, but nevertheless true.

The thawing commences about the middle of April, and the miners abandon further extraction of gravel and start building their dams and erecting flumes and sluice boxes. The latter are brought right alongside the many dumps of gravel, but the gravel cannot be shoveled into them only as it thaws out from the face of the dumps. By the time a large dump is half washed, the amount of water for washing is almost exhausted. I believe many on El Dorado creek will not get all their dumps washed this season. The majority of the miners are through with their washing by the beginning or middle of July, and from that time till November there is practically no work to be done on the mines of the Klondike or the Yukon district. Between ten and fifteen thousand newcomers (chechakas) arrived at Dawson from Juneau, down the river, between the 12th of May and the end of June, as soon as possible after the ice broke up in the river. They would arrive in Dawson and see a couple of sawmills working, and some building going on, but no other show for work. If they went to the mines they would have to pack their supplies on their backs and walk either in the creeks up to their knees in mud and disturbing a colony of mosquitoes at every step, or on the high ridges between the creeks where the trails were rough and abominable, to find everything located and very little to do. But if, instead of sitting down on the sidewalks in Dawson "chewing the rag" over their troubles, without shelter and without work, bemoaning their lot because there was not a developed mine for each and every one of them to jump onto and claim, they would only use a little judgment, build themselves a cabin, which they are permitted to do anywhere as soon as they take out a miner's license (the Canadian laws outside the city of Dawson), and having provided themselves with shelter for the winter and cut wood enough to keep them from perishing, the chances are in their favor of finding both employment and a claim during the coming season and returning in the near future with a sack and a whole lot of experience. How many return without the sack is not altogether the fault of the country.

ARIZONA.

At Stanton, in the Rich Hill country, mining is active.—There are about 100 men engaged in placer mining at Weaver.—A deal has been closed whereby E. B. Gage and others become the owners of the McNary property in Copper basin. The claims are opened and show good ore. A large force will be placed at work immediately.—The Temple Bar Co. are said to have the ground along the Colorado river on each side secured from the mouth of the Grand canyon to El Dorado canyon. They employ fifty white men and thirty Indians. They have also a bond on the property of M. Bonelle at the ferry for \$30,000 and they recently paid \$15,000 for ground.—The San Juan mine in Lone Star district has twenty-two men at work. Sinking is progressing at the rate of 90 feet per month and the vein is growing larger. The ore is copper and of excellent grade.—The Tennessee mine near Kingman shipped seven cars of ore to the smelter.

At the 250-foot level of the C. O. D. mine in Mojave county a good grade of concentrating ore is being taken out.—The Cherry Creek G. M. Co. of Yavapai county is reducing the ores of the Elta mine with a 10-stamp mill. The large vein produces ore from \$15 to \$40 per ton, and most of it is free milling.—The last carload of ore from the Blackfoot mine in Mojave county averaged 204 ounces in silver per ton, 7 per cent copper and several ounces of gold.

The Old Dominion Copper M. & S. Co. has resumed smelting copper after a shut down of seventeen months, waiting until the railroad should be built, which is fifteen miles from Globe.—Large consignments of ores from the mines near Kingman arrive daily. Of the producing mines the Tennessee at Chisleride is the heaviest, followed by the Merri-mac, Paysall and Elkhart.—The Oro Mining Co. in the Oro Blanco district will increase its milling capacity to thirty tons daily.

Yuma Star: On the Carmen mine near Yuma a 100-foot shaft has been sunk, and the first 50 feet display a ledge running \$35 per ton, 3½ feet in width.—The Muey Bien has two shafts, 84 and 32 feet, and the ledge averages 9 feet. The ore ranges from \$7 to \$72.—The Saginaw mines and mill near Tucson are again running.—Thirty-five men are employed at the Mojave county Sheeptrail mine.—A 200-ton cyanide plant is contemplated at the Little Jessie mine near Prescott.—The Planet-Saturn mine at 800 feet depth has cut a vein of high-grade ore.—The Maguire mine near Kingman is being tested for H. J. Delamar.

CALIFORNIA.

Amador.

Dispatch: The Blue Lakes Co. has had an increase of water since the advent of cool weather, and as a result the Kennedy mill is operating forty stamps again.—The Keystone mill at Amador City resumed operations last week, after an idleness of two months owing to shortness of water.—At the Amador Queen No. 2 mine, Jackson, the two sets of lessees have struck a rich streak of ore in the 150 and 300 foot levels. The shaft is down 300 feet from the tunnel and 600 feet from the surface. The shaft is being sunk on contract work.

Republican: The shaft of the Bay State mine at Plymouth is about 700 feet deep and work has begun to unwater it. Enough rock is being taken out of the tunnel at the 100-foot level to run ten stamps.—Work is progressing at the Wheeler mine. Only five stamps are used at present, but a new mill is being erected, in which an additional fifteen stamps will be placed.

Record: The final payment of \$56,750 was paid last week by the Bailoi M. Co. on its properties at Sutter Creek. The total amount paid for the Marre, Allen and Hayden ground was \$100,000. The Bailoi Co. will at once resume operations on a large scale.—The Central Eureka has arranged to pay its indebtedness and will resume sinking the shaft.

Butte.

Alm Bros. & Wickman have leased the Campbell mine and mill at Enterprise and resumed development on the property, which has been idle a year.

Work is resumed at the Carlisle quartz mine near Forbestown and the mill put in good condition. The mine has been closed for time. Indications are that the quartz will pay with proper management.

The Gold Bank Co. at Forbestown is working its regular force making repairs and putting in machinery preparatory to working ore in the Gold Bank proper.

Near Rio Benito last week two new dredgers were launched. There are now three dredgers operating for gold on the Feather river.

Register: McClung & Braselton have bought the Sunnyside mine and will push developments.—Work on the ditch of the Banner M. Co. is progressing. Four gangs are employed and although on one section the rock is very hard good progress is made.—Huse & Wilson have struck a ledge of gold-bearing quartz near Bidwell Bar. They have a shaft, and a tunnel 100 feet. The ledge is 3 feet wide. They have put up an arrastra and made one run that turned out well.

Calaveras.

Prospect: Lund & Sorenson have opened up a small vein of good ore in their claim, near Skull Flat.—At the Eaton mine sinking has been suspended and levels are being run on the vein.—The Machu mine, at West Point, has been unwatered and taking out ore has begun.—Gibson & Manley of West Point, developing a mine on the North Fork, are hauling ore to the Granite mill.—The Bruner mine has been bonded. The company which has possession of the property is making a trial run of 100 tons of ore.—The Golden Gate mine, near San Andreas, was bonded to W. H. Clary & Son for two years for \$7000.—Zavilla, Cueto & Co. have driven a tunnel 130 feet, showing a vein averaging 1 foot in

width that will mill \$25 a ton.—D. Palmer is opening the Chilli Hill gravel mine, which has not been worked since the '50s.—The Thorpe mine, owned by the California Expl. Co., is to have a 30-stamp mill in a short time. The Thorpe has developed some good rock.

Citizen: The Great Western mine, at Altaville, has been bonded by the Drake Properties for \$300,000 cash and \$12,500 April 1, '99.—The Lively G. M. Co. of San Andreas has both its mines—the Fellowcraft and Bodie—in operation.

El Dorado.

(Special Correspondence).—The Smith & Rainey mine and 10-stamp mill near Kelsey have resumed work. The property has been idle for some time. The Strable slate quarry which has not been worked for several years has begun work under a new organization. The output under present methods of work will be quite extensive.

Kelsey, Oct. 10th, '98.

The U. S. Debris Commission has granted a permit to F. J. Goyan & Co. to mine by hydraulic process near Placerville.

Inyo.

P. Reddy of San Francisco has bought half interest in the Indian Queen mine near Benton.

Kern.

Los Angeles Review: In the Rademacher district the Baron mine shaft is down 200 feet. Levels have been run and good ore bodies have been opened. Three thousand tons of ore are on the dump.—The Badger is opened by a 200-foot shaft and 100 feet of drifting. Sulphure ore is shown.—McNitt & Co. have sunk a 100-foot shaft, showing 3 feet of high grade ore.—McKinney Bros. are down 150 feet on their claim, and by drifting and cross-cutting, expose a good body of sulphuretic ore.—The Eureka mill is running on Little Butte ore, as are five stamps of the Johannesburg mill. The other stamps of the latter are crushing Big Butte ore.—The Little Butte, besides keeping its stamps busy on low grade ore, is shipping large quantities to Barstow.—The Eureka mill made a four-ton run of ore from the Santa Ana mine, which netted \$400.—De Roemer Bros. had twelve tons milled which netted \$1600.—The Eureka mill people are buying all the base ore that is brought to them, paying smelter rates on assay value, less transportation charges.—At the borax works the Colo. & Cal. M. D. Co. is sinking on a 25-foot ledge of low-grade, gold-bearing quartz. They are down 75 feet, and at that depth there has been no diminution in the size of the ledge.

Randsburg Miner: M. Scott, of the Merced mine, near Randsburg, had twelve tons of ore milled at the Eureka mill which yielded \$1600. Another three tons brought \$300. This is the result of one month's work.—At the Hard Cash mine, a dry concentrating plant is being built. The mine has large body of low grade ore. This is the first mill of the kind in this district.

Nevada.

The Bismark & Gladstone mine near Nevada City will resume work as soon as water can be obtained.—The Diamond quartz mine near Rough and Ready has been bought by people from Cleveland, Ohio.—Union: The old Union Hill, Cambridge and Lucky group of mines have been bought for \$12,000 from the McLean estate by E. Crelmer.—At the Missouri river claim near French Corral the daily cleanups have been big. The flume into which the river water is diverted is 14 feet wide and 6 feet high and has a capacity of 68,750 inches. A storage dam is 100 feet long and 10 feet high. The plant is run by two undershot wheels, one supplying power for the derrick hoisting the gravel and the other furnishing the pump, the buckets of which are 6 x 24. Fifty men are employed, working eight-hour shifts.—The Malakoff mine at North Bloomfield have struck soft ground again and are making good headway.

Placer.

Colfax Sentinel: The Pioneer Co., near Towles, has sixty-two men on the payroll and is putting in an electric plant. Fifteen stamps are being run by a gas engine. The two Rix compressors run the drills by steam. The company has measured for use this season 2684 cords of wood. A tunnel to tap the ledge will soon be started 750 feet below No. 4 tunnel, and will still be 530 feet above the bed of the river. Poles for wire from the power plant to the mill, a distance of 4000 feet, have been set. Work on the dam on the American river is progressing. The dam is located 1600 feet below tunnel No. 3. It is built of logs and will be 24 feet high. The length across the stream will be 150 feet. The width of the dam at the bottom will be 50 feet and at the top 4 feet. It is built of cribs filled with stone ballast. A flume 6 x 7 feet conveys water 900 feet, where, with a head of 38 feet, it will be used to run the 353 H. P. water wheel. The electric power will be transmitted to the mine for running the 20-stamp mill, the blower and the two compressors. The company hope to have the electric plant in operation Jan. 1st.

At the Herman mine, near Westville, twenty-five men are employed. The 10-stamp mill is running day and night. An average of thirty tons of ore is crushed every twenty-four hours. Tunnel No. 3 crosscuts the ledge at 300 feet, and has been run on the vein 900 feet. The ledge is from 7 to 10 feet in width. A lower tunnel has been run and sinking done to connect with the tunnel. Water for the mill is pumped from the lower tunnel. Steam power is used to run the mill. The company next spring will build a 24-stamp mill. Dr. J. L. Barton is Supt. of the mine.

Riverside.

The Good Hope mine at Perris is said to be working in a large body of good ore.

San Bernardino.

In the Pinon district a number of properties are producing good ore. The Lost Horse mine

has a 10-stamp mill at work, while two other small mills are running in the district.—From Oro Grande there is some good ore being sent to Barstow.

San Luis Obispo.

At Cambria the Oceanic quicksilver mine is to be incorporated. There is a very large cinnabar deposit yielding about one-half of 1 per cent. The output is about fifty flasks monthly. W. H. Wright is manager.

Sierra.

E. Reynolds has leased the Morristown hydraulic claims near Port Wine and will operate them.—At the Plumbago mine near Alleghany progress is being made on the new air compressor plant.—The Happy Hollow claim is employing a number of men and taking out good gravel.

Enterprise: The North fork mine at Forest made a cleanup last week of sixty-five ounces.

Messenger: Last week the York mill near Downieville was started and five stamps will drop as fast as the ore can be extracted.—Developments at the Gold Bluff mine continue night and day. I. Copeland is sinking with twelve men employed. The new machinery is working successfully. The new air hoist recently put in is giving satisfaction. He is also unwatering the Triple Pocket mine near Downieville.

Shasta.

The engine room at the Mammoth mine, in Old Diggings district, was destroyed by fire on the 11th. A thirty-gallon tank of gasoline in the building exploded. A storeroom 50 feet away containing 2000 gallons of gasoline escaped.

The mining companies of the county who employ most of the labor of the county exact a monthly payment from their employees to pay for hospital service in case of accident or sickness.

At the Mountain Copper Co.'s mine the first six months of the year 103,000 tons of ore were extracted, averaging 7.53 per cent of copper. The stacks in process of calcination and local treatment at Keswick were increased, as only 72,000 tons of ore were smelted, producing 4329 tons of copper in matte, which has been sent to the New Jersey works to be refined. The delivery of fine copper from these works during the period was 3980 tons, of which 2900 tons were marketed, the balance being still in process of treatment for the separation of its gold and silver.

Free Press: The mill at the Gopher mine near Iron Mountain is shut down pending the construction of a building to house the machinery.—E. W. Brackett is again shipping ore from the Mount Pleasant mine to the smelter.—Masons are at work at Keswick on a new rotary roaster for the Mountain Copper Co.—C. A. Hamilton of San Francisco, accompanied by J. Barr, the representative of a syndicate of Scotch capitalists, is examining the Cleveland Con. M. Co.'s property at Bullychoop.—Hanley & Cannon have sold to G. McEnery and others a half interest in their mining property in the Hazel creek mining district, comprising five locations.

Searchlight: Near French Gulch, on the Washington mine, Blagrove & Collins have about thirty tons of ore that will mill \$70 a ton. D. McQueen has forty tons of \$25 ore on the dump. Blagrove & Condon have an 18-inch vein which assays \$308 a ton.—Donabue & Sweeney have 8 inches of ore that will assay \$400 a ton.—Foster & Co. have good shipping rock; eight tons netted \$1600.—On the Oro Psyche, Chambers & Driscoll working on a lease have forty-six tons of \$70 ore on the dump.—On Vogel & Reinhaus' claim the tunnel was driven 230 feet and opened 2 feet of ore assaying from \$160 to \$180 a ton and free milling about \$20. They have forty tons out.—The owners of the Central mine in Old Diggings district, Whitehouse & Bliss of New York, will resume work shortly.

Trinity.

Work on the new tunnel of the Brown Bear mine at Deadwood has begun. It will prospect four ledges. The length of the tunnel will be 4200 feet. It will give in depth below the lowest workings 360 feet.

After three years of work G. Carr of the Boulders mine in Echo Lake district has tapped an 8-foot ledge of quartz.

Journal: Near Dedrick, at the Stanley-Helen mines twenty men are employed and tunnels are being run, shafts sunk and general development carried on. If development justifies a stamp mill will be erected in the spring.—At the Chloride-Bailey group a large force are taking out ore.—At East Fork the Enterprise Co. are working steadily on their property with success.—Day & McWorthy have bought the lease on one of the Enterprise Co.'s mines and are working it.—R. A. Skinner, owner of the Yellowstone mine is driving a tunnel and making good progress.—A second large shipment of machinery for the new hoisting and pumping plant of the Altona Quicksilver M. Co. at Cinnabar has been received.

Tuolumne.

(Special Correspondence).—The Eureka Con. mines at Summerville are on the east belt. The main shaft is 1670 feet deep. The vein matter at that depth is 20 feet in width, carrying free gold in streaks. The pay matter runs from 3 to 15 feet. About 1 per cent of sulphurets are found of \$40 value per ton. At present they are not working, the power being water. The project in the future is to open up the mine by a tunnel driven from the North Fork canyon. When the shaft has been sunk 1700 or 1800 feet the Eureka will be the deepest exploration in the county. F. Corkhill is the Supt. The company is erecting a cyanide plant and making general repairs.

Summerville, Oct. 11th, '98.

The Santa Isabel is just about paying expenses and has \$63,000 on hand.—At the Big Betsy mine, Groveland, a new engine and boiler is being put in. A good deal of mining machinery is arriving at Chinese Station from the Groveland country.

The Oro Grand mine, at French Camp, is

showing a 4-foot vein of fair grade ore. The property has been idle many years until recently.

Sonora Democrat: A hearing will be held before a notary public in Sonora, November 2, as to the mineral or non-mineral character of a list of Government lands, which have been returned by the Surveyor General as mineral, but the department may classify them as agricultural. All these lands lie in mineral belts; but landholders are after them, and hundreds of quartz and placer claims will be lost to miners unless they look up the lands and appear with evidence of their mineral character. Attention is likewise called to another advertised list of lands in this county, which have been selected by the State as idemity school lands. It is asserted that they are all mineral, but will be declared non-mineral unless protests are filed at the land office at Stockton before October 27.

Magnet: There are 160 workmen at the Shawmut mine, Jacksonville.—At the Atlas mine, near Tuttle town, work has begun on a 2000-foot tunnel which is to cut the vein at 500 feet depth.—The Dutch Co. at Quartz has again started the 20-stamp mill.—The shaft at the Mazepa mine, near Stent, is down 90 feet.—The Densmore mine, near Parrot's ferry, has been bought by J. Fischer & Co.

Yuba.

M. Wolf is developing a quartz property near Dobbins and will keep a full force at work during the winter.

COLORADO.

BOULDER COUNTY.

T. J. Crone has leased the B. & M. properties at Eldora for \$20,000.—Returns from a 25-ton shipment from the Anti-tam mine gave \$25 per ton in gold. Ore is being sacked for shipment which will run from \$60 to \$100 per ton. Over 100 tons are on the dump that average \$30 per ton.

The Populist tunnel at Eldora is in 250 feet and is outputting ore from \$30 to \$75 per ton in gold.

CHAFFEE COUNTY.

The strike at the Pass Creek mine in the Poncha district shows a vein of 54 inches of ore that returns \$53 per ton.—The Chance-Excelsior group of five claims on Cameron mountain has been leased to Hatfield & McKee for \$15,000, and work will begin Nov. 1st. The new Tetrault mill at Whitehorn, with a daily capacity of ten tons, will be in operation the 15th inst.

A half interest in the Iron Mask and Sundown was sold to W. Scott for \$5000 cash.

CLEAR CREEK COUNTY.

The Alice mine and mill on Yankee Hill has resumed work. The ore averages \$3 per ton. The mill saves 95 per cent of the values and it costs less than \$2 per ton to mine and mill.—The King Solomon mine on Yankee Hill has been a producer of \$60 gold ore since last April.

The Denver Republican tells this, which is new, if not so: Near Georgetown, T. Cunningham, two weeks ago, uncovered what appeared to be a vein of silver glance running 75 per cent pure silver. After sinking 13 feet he found that he was in a slide. He followed the flow some distance and came upon a vein of ice several feet in thickness impregnated with particles of silver glance, assays showing it to run several thousand dollars per ton in silver. The vein of ice has been followed for some distance and still maintains its richness. At intervals solid chunks of silver glance are found twisted as though they had been subjected to tremendous pressure or heat.—In the Naylor Lake district a vein running over 200 ounces in silver was uncovered.—The shipments from the Pelican Dives and Dunderberg mines continue and the mills are almost blocked with ore. All the leasers on these two mines, numbering over 200 men, are shipping their ore.—The Griffith is shipping seventy-five tons a week, which will average about \$55 to the ton.

EL PASO COUNTY.

A twenty-four months' lease has been given on the Nettie Dutcher Co.'s block of the Elkhorn to S. McDonald for \$35,000.—Litigation on the ownership of the Elkhorn property on Carbonate Hill has been settled out of court. The claim comprises three and three-fourths acres.

The production of the Lillie for September was nearly 1200 tons.

Near Woodland Park the new forty-ton stamp mill belonging to the Deposit Co. is running full time.—The Frisco cyanide mill at Golden gulch is running steadily and the tanks are being filled. There are 150 tons of ore on the dump.—The Farrell mill on Bald mountain is nearing completion and the owners expect to fire up about the 15th inst.

The Victor mine, Cripple Creek, output 1800 tons in September and promises an increase of one-third as soon as the improvements in progress are made. Dobois & Connel, leasing the Wallace, Victor property, are in good ore and are making regular shipments.—The output of the Portland mine has been kept to a limit for two months, all work over that has been in the line of development. The ore between levels seven and eight is the richest yet found. Water is making 1000 gallons per minute and is full capacity of the pumps.—The Lucky Guss of Cripple Creek a few months ago was covered with miners' liens, and had nothing but debts in sight. Under the new management all debts were cleared off in June, new development commenced in July, a number of leases were granted and the company is receiving a goodly sum in royalties.

Post: The Battle Mountain Con., near Victor, is making regular shipments from its new discovery in the Trail tunnel. The last shipment averaged \$30 per ton. A steady output is also being maintained from the Wilcox and Cramer leases on the Trail.—The Portland mine is again suffering from too much water. Work below the ninth level has been

suspended on this account and will not be resumed until a new pump is installed, which will be within sixty days.—The daily output from the Kieth & Grube lease on the Victor amounts to twenty-five tons of \$35 ore.—The Arequa Savage on Beacon hill has been leased to J. Dozier of Colorado Springs for \$70,000.—The Woods Investment Co. gives the production of the Gold Coin for September at 2800 tons. The main vein at the fifth level is said to be about 20 feet in width, with values fully as good as were those above.—In the Independence the output remains at about forty tons a day.

GILPIN COUNTY.

During September there was shipped from Black Hawk 326 cars of ore, or 5868 tons.

The last lot of smelting ore shipped by the lessees on the East Notaway near Central City brought \$484 46 per ton as follows: 35.62 ounces gold, 7.24 ounces silver, and 3.20 per cent copper per ton. The ore body is holding out good.—During September the Phoenix-Burroughs produced 2855 tons of ore, of which 2725 tons were mill ore and 130 tons were smelting ore. That property employs 100 men.

The Concrete mine in Eureka district employs fifty men and the September production was 1530 tons mill ore.—A lot of ore is being taken out through the Bobtail tunnel, from the leases on the Bobtail lodes, and from the Klein-German and A. P. R. properties. The tunnel rights are owned by an English syndicate who exact a toll of 25 cents per ton on all ores hauled through the tunnel.

LAKE COUNTY.

The Theodolite group of mines near Leadville has been bonded to an Eastern Co. for \$250,000.—The Ibox M. Co. is pushing work in its shafts, drifts and levels and while ore shipments are heavy, development is opening up ore bodies daily and the reserves are large. Shipments for last month were 8000 tons. The working force is 450 men. The A. Y. & Minnie mine and mill have resumed operations. The shipments daily are forty tons of concentrates carrying 25 per cent lead, 20 ounces silver, 25 per cent iron and some gold.—The Red Cliff mine is daily shipping two carloads of low grade ore.

At Leadville, the Leadville & Gunnison Railroad will extend its line to a portion of the silver-lead producing section of the camp which will enable the mines there to increase their output, and within a few months many of the big mines of the camp will be connected by rail with the main lines of the roads.—Catalpa-Crescent continues its production from a number of claims of the group which are in operation by lessees. The output runs in the neighborhood of 6000 tons per month, half of which is oxidized iron and the remainder manganese.—On the New Monarch and Lida shipments last month were over 1200 tons.

LA PLATA COUNTY.

Reports from the Omaha & Grant Smelting Co. at Durango show that during the present year the increase in concentrates has been 50 per cent in excess of the production of last year.

MINERAL COUNTY.

Creede Candle: The Creede M., M. & L. Co. is working night and day and shipping 100 tons of concentrates every month, in addition to several cars of smelting ore. The mill is completed and running.

At Creede Wilson & Coombs, on the Ridge, are shipping 600 tons of ore per month.—The Amethyst is working a large force and shipping 300 tons a month.—From the Solomon about 125 tons of concentrates a month are shipped, in addition to a number of cars of zinc.

SAGUACHE COUNTY.

The ore shipments from Creede last week were ninety-three carloads.

SAN JUAN COUNTY.

Twenty-two inches of smelting ore in the Champion mine on Sultan mountain pays \$600 per carload, the balance of the ore running \$50 per ton. The vein is 6 feet wide.

Ore is found in the Reed mine on Boulder mountain that returns from the sampler \$16 in gold and 128 ounces of silver per ton. The outcrop of the vein has been traced over 2000 feet.

SAN MIGUEL COUNTY.

L. W. White has leased and bonded the Wasatch near Telluride for \$25,000.—The ore from the Marie Antoinette mine at Ophir plates \$35 per ton in gold. The vein is 7 feet wide and is all milling ore and requires no sorting.

SUMMIT COUNTY.

In the Swandyeke district another body, 3 feet wide, of manganese and iron has been uncovered which runs forty ounces of silver per ton.

IDAHO.

The first shipment of copper bars from the Cuprum smelter in the Seven Devils country was fifteen tons. The assay showed 98½ per cent copper, \$12 gold and \$41 in silver.

Near Murray nearly all the mills in the gold belt are running again. Both mills of the Golden Chest are running on ore from the Dora and Katie Burnett.—The Yosemite mill will start in a few days after a long idleness.—The Daddy mill is busy and there is ore in sight to run it all winter.—The Mother Lode mill, the only water power mill in the camp with a single exception, is again running.—The Granite mill is running five stamps; the gold-saving capacity of the mill has been increased.

The Hummingbird M. Co. has let a contract to continue its lower tunnel 300 feet. The company owns five claims; in one tunnel they cut 45 feet through a lead carbonate ore which also carries gold.—The Sonora M. & M. Co. has let a contract to continue the tunnel, which is 466 feet, an additional 334 feet.

The Lucky Boy mine of Custer shipped a gold bar last week amounting to \$2500.

Statesman: In the Morning Star mine at

Basin the tunnel has been driven 2190 feet. It cuts four veins. The largest lode is 207 feet wide. They are running a number of drifts and most of them are in pay. The second ledge is 12 feet thick. The other two veins are also good. Development is being done on all of them. A shaft is 252 feet deep.

Supt. J. T. Keegan says a mill will be erected with concentrating tables and a cyanide plant. The concentrates will be handled on the ground.—The H. J. Kelling Co. of Chicago is building, near Salmon City, a gold-dredging plant of large proportions on a tract of placer ground bought for \$150,000. The plant is of the New Zealand type with all the heavy parts annealed steel, and has a daily capacity of 4500 cubic yards. The boat was floated last month and the machinery is on the ground and being rapidly put in place. The company expects to make a test run this fall before the ground freezes up. This property has been worked twenty years by hydraulicking from one to three months each year, as the water supply permitted, during which time they took out something like \$75,000. It produces what is probably the purest gold found in Idaho; it is worth \$19.75 per ounce as it comes from the ground. The pay streak is 200 to 300 feet wide and 12 to 20 feet deep and averages 60 cents per cubic yard. The gravel is fine and the bedrock soft, crumbly granite.

World: Shipments of ore from the Narrow Gauge group of mines near Hailey have begun. They will ship about fifty tons a month.—The Cresus mine and mill have started up for a winter's run.—At the Independence mine near Idaho City a cleanup from seven tons of ore crushed in an arrastra weighed 21.1 ounces, worth \$13 76 per ounce.

MICHIGAN.

The Marquette Mining Journal says that on Oct. 1 the mines in Houghton county furnished employment to 10,400 men, an increase of 1742 over that of Oct. 1, 1897. Add to this the number of employees of Keweenaw and Ontonagon counties, and the total will be swelled to about 11,000. This increase promises to be duplicated within the coming year. Monthly payrolls of the mines in the vicinity of Calumet alone now aggregate about \$400,000.

MISSOURI.

At Joplin mining district, the total value of lead and zinc sales for the week ending Oct. 1st, was \$152,492, and top-grade zinc ore advanced \$3 per ton, closing at \$33, dropped to \$22.75 per 1000 pounds.

MONTANA.

The third annual report of the Anaconda Copper M. Co. for the year ending June 30, '98, gives the following results of the year's operations: Shipments from Anaconda—124,417,471 lbs. fine copper, 5,300,000 ozs. fine silver, 16,610 ozs. fine gold. The sales during the fiscal year amounted to 135,002,147 lbs. fine copper, 5,706,377 ozs. fine silver and 19,930 ozs. fine gold. The following statement shows the sales and prices realized for copper, silver and gold for the past three years:

| COPPER | | |
|---------------------|------------------------|----------------------|
| <i>Fiscal Year.</i> | <i>Lbs. Sold.</i> | <i>Price per lb.</i> |
| 1895-6..... | 105,470,705 | 10 08c |
| 1896-7..... | 120,864,007 | 10 76c |
| 1897-8..... | 135,002,147 | 10 82c |
| Total 3 years.. | 341,343,039 | |
| SILVER | | |
| <i>Fiscal Year.</i> | <i>Fine Ozs. Sold.</i> | <i>Price per Oz.</i> |
| 1895-6..... | 4,498,560 | 67 01c |
| 1896-7..... | 6,057,067 | 64 08c |
| 1897-8..... | 5,706,377 | 66 73c |
| Total 3 years.. | 16,262,004 | |
| GOLD. | | |
| <i>Fiscal Year.</i> | <i>Fine Ozs. Sold.</i> | <i>Price per Oz.</i> |
| 1895-6..... | 14,364 | \$20 62 |
| 1896-7..... | 18,511 | 20 65 |
| 1897-8..... | 19,930 | 20 67 |
| Total 3 years.. | 52,825 | |

Since the organization of the present company the aggregate profits for the three years amount to \$12,945,908.92. During this period \$6,750,000 have been paid in dividends, leaving a balance or surplus of \$6,195,908.92. About \$1,000,000 of this surplus has been devoted to an increase of capital and the remaining \$5,200,000 is represented by working capital in the shape of the various metals produced, cash, etc. Houston & Co. hear that Anaconda production recently has been from 8,000,000 to 10,000,000 pounds of copper per month.

All the mining companies in the Butte district of Montana continue to run full capacity, hoisting about 11,000 tons of ore daily. When the Washoe Copper Co. begins extracting ore and the Butte & Boston completes its development, Butte's daily output will be at least 15,000 tons of ore.—The Granite-Bimetallie Con. M. Co. at Phillipsburg has filed its annual statement with the recorder of Granite county, which shows that it is capitalized for \$10,000,000. Its total indebtedness in Montana is \$35,288 and outside of the State \$90,551.

J. W. Ladd of Boston has brought suit in the U. S. Court against the Montana D. P. Co. for alleged trespass of property for \$12,888 88 and costs.—Mesh & Johnson, leasers of the Sunbeam mine near Sheridan, shipped to the smelter at Butte fifty-one tons of ore which yielded them \$20,900 in gold.

Two strikes have been made in Saltese district by the Eclipse M. & M. Co. near Saltese. The more important is on the Kearsage, being 3 feet of ore which runs 25 per cent lead and 140 ounces in silver. They have about four carloads of it ready for shipment. The other is on the Shakespear, where they have cut through 5½ feet of ore and are not yet through it. It runs 25 ounces in silver, \$3 to \$5 in gold, a little copper and no lead.

Clancy Miner: The East Pacific mine at Winston is to be incorporated under the laws of Maine, with head offices in Boston, as the East Pacific Mining Co. It employs 110 men. The tunnel is in 1600 feet and is being driven

100 feet a month. A 50-ton concentrator will be built.

The *Inter-Mountain* says that the Washoe M. Co. has opened offices in Butte and the impression prevails that the work on a new smelter is not far off. The Washoe M. Co. has for its principal owners Marcus Daly and J. B. Haggin, but will be run distinct from the Anaconda Co. The principal mines of the Washoe are at Butte. In addition they have extensive coal fields and lumber interests, all calculated to make one resource depend on the other. The basis of so much mineral wealth in mines has been planned and perfected for three years until at this time a large smelter is all that is necessary to make a company almost as large in proportion as the Anaconda Co. Mr. Haggin has arrived from the East, and it is claimed the new site for a smelter will be selected.

NEVADA.

Near Como on the Ely mine an 18 inch vein was opened that runs 454 tons.—The test run from the Reno mine at Como gave bullion returns of \$2900.—Work in the copper mines at Golconda has been suspended, awaiting the building of a railroad to the property. Work on the railroad was begun this week.

The upper workings of the Diamond mine, near Eureka, have been leased to tributaries. The White Pine News says eighteen copper claims in West Camp have been bonded and will be worked, and that the Chalmers mill will start up in a few weeks.—Salt Lake people will continue the development of the Old Imperial mine at Cherry creek. The tunnel has been driven 12.0 feet.

Twelve miles of narrow-gauge railway will be built between the mines of the Glasgow & Western M. Co. and the Adelaide Reduction Works at Golconda to cost \$100,000.

The ore shipments from Eureka and Hamilton districts for the week ending Oct. 8th were 4709 80 pounds.

NEW MEXICO.

New Mexican: The Santa Rita Copper & Iron Co. is shipping six cars of ore daily from Silver City.—The Helena M. Co. of Graham is preparing to operate its plant with electric ity.—The Timber Peak M. Co. of Socorro county is completing a reduction plant of 150 tons capacity to run on the company's ores.—The September payroll of the Richmond mine in Sierra foot up \$2300. The payrolls of the Snake and the Opportunity mines foot up \$3000. The Tripp mine has increased its force to twenty-six men.—The large copper properties near Hillsboro have been bought by M. M. Freed of Salt Lake City, who will erect large reduction works there. It is said that there are nearly 2,000,000 tons of ore in sight and that will yield from 6 to 8 per cent copper and some gold and silver.—The output of Hillsboro's gold mines for the week ending Sept. 29 was 280 tons; total since Jan. 1, 6310 tons.

OREGON.

Operations at the Braden mine near Gold Hill are being pushed. Many improvements have been made and the mine and mill will be worked to full capacity.

Grant's Pass Journal: Near Grant's Pass the Sugar Pine mine has been bonded to R. Jones, who has let a contract for tunneling.—H. M. Chapin is opening up a mine near Merlin.—C. D. Crane, Supt. Oro Fino, has resumed work at the mine. All ore taken out will be shipped.—The Eureka M. Co. will have their cyanide plant in operation in three weeks.—Ten men are working on the dredger near Tolo. It is said that the machine is a success.—J. Hill has sold a half interest in his placer mine on Rogue river to M. Pyles, who will equip the mine for hydraulic mining.—La Bellevue mine, at Granite, is said to be on a paying basis and everything is working well. Five tons of concentrates are being shipped daily. The property is owned by J. Bamberger and D. Keith of Salt Lake City.

SOUTH DAKOTA.

In the Omega mine, at Terraviva, a cement ore is produced, of which three men break about thirty tons in twenty-four hours. The average value is from \$4 to \$5 a ton. A 10-stamp mill crushes thirty tons a day. The cost of mining and milling the ore is put at \$1 a ton.

UTAH.

From Silver City were shipped last week thirty-nine carloads of ore.—It is estimated that the output of the Old Jordan concentrator at Bingham for October will reach over 1500 tons.—The No. 7 tunnel on the Highland Boy at Bingham has been driven 300 feet, expecting to get the vein at 1000 feet.—Assays from the War Eagle at West Tintic show 175 ounces silver, 35 per cent copper and \$1 in gold. The ore body is extensive and is on the 200 level.—Shipments from Bingham last week were 1000 tons, besides 160 tons treated at the Markham mill.—The daily output of the Silver King mine at Park City is 100 tons of second and 50 tons of first-class ore.—Ore shipments from Park City for the week ending Oct. 8 were 1,587,950 pounds.

The further development of the Eagle M. Co. property at Eureka will be done by air drills.—The Ontario at Park City for September marketed nearly 900 tons of crude ore, while the run on the tailings from the old Ontario mill has increased to seventy tons daily at the Marsac. About 100 men are employed.—In the Luzerne at Silver City another strike has been made of a good quality of ore at a depth of 300 feet, running well in copper.

Work on the property of the Electric M. Co. at Sunshine will be resumed November 1st and continued through the winter. The company has done about 1600 feet of prospecting.—At Provo E. E. Schmidt sold to G. Robinson a half interest in the Cyrus Oliver mining claim for \$3000.—The Mercury mine shipped its first October lot of auro-cyanides. The value is \$25,000.—The Ophir Hill Con. mine marketed 1500 tons of concentrates during September.—The big blast furnace at the Hanauer smelter has blown in and will run

continuously. The starting of the furnace will employ twenty-seven men and will dispose of 100 tons of ore daily. At the same time the new steam blowing plant was put in operation.—Connection with the main ore bodies of the Bullion-Beck at Eureka has been made. To do so it was necessary to drift 500 feet off the 1300-foot level. The ore bodies are said to be of large size.—The Galena of Fish Springs has recovered the old and original ore chute from which its shareholders derived dividends amounting to \$71,000, and is raising ore which shows 250 ounces in silver and 72 per cent lead. In January, '97, the Galena chute disappeared at a depth of 280 feet. The shaft was put down to 500 feet and a drift run and the original chute recovered.

At Green river wells are reported discharging water impregnated with pure carbonate of soda susceptible of commercial utilization by evaporating the water.

Mining: The Highland Boy M. Co. of Bingham has secured a bond on the Honorable mine at Stockton and will soon commence sinking. They will employ thirty men.

J. P. Mitchell & Co., leasing in the Honorable, shipped thirty-five tons of high-grade ore last week.

The Hercules has resumed work. The Geyser-Marion made its semi-monthly shipment of cyanides, amounting to 500 pounds.—It is estimated that \$150,000 worth of cyanides have accumulated at the Golden Gate mill since August 23d, the date on which the refinery was closed down.—The Northern Light shipped cyanides last week weighing 250 pounds valued at \$2500. It is reported that a large body of milling ore running twenty ounces per ton in silver has been found.—The Chloride Point made a double shipment of cyanides last week. They will make semi-weekly cleanups in a short time.

Tintic Miner: The Mammoth at Eureka on the 600 level uncovered a body of copper which will run 50 per cent and a vein of quartz that assays from forty to fifty ounces silver and two ounces gold.—Shipments from Tintic last week were seventy-nine cars of ore, five of concentrates and four bars of bullion.—C. Hutchinson shipped two cars of copper ore, one from Milford and one from Frisco, for a test run.—The second payment has been made on the Big Indian copper properties at Moab by Loane & Co. of \$5000. Since the present owners obtained the properties they have run 1200 feet of tunnel and have in sight considerable ore ranging from 8 to 50 per cent copper.—In the Silver King at Stockton on the 300 level an ore chute 12 inches wide was uncovered which assays 75 per cent lead, forty ounces silver and \$1.60 in gold per ton.

Tribune: Having satisfied himself that it is possible to bring a number of properties that have hitherto defied working at a profit within the radius of paying ones, Prof. Chas. Butters is trying to tie up a number. It is learned that his tests on Mercur mill tailings had been followed by overtures looking either to an outright purchase of the dumps or to the leasing of them.—The cyanide tankage capacity of the Golden Gate mill is being increased from 2500 to 5000 tons.—The Sacramento Co. will construct roasters and double its present output.—Within ninety days the mill at the Cigale, with its plant for the roasting of its ores, is to be in operation.—The Overland new mill will be putting out auro-cyanides within thirty days.—The Washington mine at Frisco made another shipment of 100 tons, yielding 25 ounces silver and 15 per cent lead.

WASHINGTON.

At Republic the Gold Leaf tunnel No. 1 is in 205 feet and driving at the rate of 2½ feet a day.—Near Springdale the Cleveland mine is showing good ore; shipments will begin soon.

The output of the Republic mine, in Republic camp, for September was 270 tons milled, which produced in round numbers \$28,000, and 143 tons shipped, which yielded net \$35,000. The mill is an electro-cyanide plant and was installed as an experiment, the capacity being only ten tons per day, but as it proved a success it will be increased to a 35-ton mill. All the ore is made to pass through a 120-mesh screen. They are saving 90 per cent of gold and silver at a cost of \$6.50 per ton, which includes \$1.50 per ton for crushing. The average of ore shipped to the smelter is eight and one-half ounces gold and seven ounces silver.

The Everett Hydraulic G. M. Co. is preparing for extensive work near Everett. Seven prospect shafts have been sunk 25 to 93 feet in depth and a tunnel driven. The gravel yields about 25 cents to the cubic yard. The company owns 320 acres. A flume has been built for water supply three and three-quarter miles long. Before an attempt will be made to take out gold over \$100,000 will have been spent putting everything in readiness. The earth will be washed into two flumes each 1000 feet long, 4 feet wide and 4 feet deep.—Bourne & Brown have sold the Mountain Lion mine at Republic to the Mountain Lion M. Co. for the \$150,000.

At Bossburg the Copper-Gold M. Co. has sold 100,000 shares of stock at 5 cents and will put the amount into development work.—The new 100-ton steam hoisting plant of the Bonanza mine will be in place within ten days, when 100 tons of ore per day will be raised and shipped to the smelter.—The ore shipments from the Le Roi mine to the Northport smelter are from 350 to 450 tons per day. The plant is running at its full capacity.

At Colville, Wash., on the 9th a deed was filed transferring the forty-seven acres of land at Northport occupied by the smelters there to James Breen. The deed is signed by W. D. Turner, as president, and J. M. Armstrong, as secretary, for the Le Roi M. & S. Co. There are \$15 worth of internal revenue stamps on the deed.

There is an object lesson in the history of the Mountain Lion, in Republic. As a prospect the claim was not more favorable looking than a dozen of others in the camp, but W. H.

Brown, who owns half of the claim, is a miner. He laid his plans so that every dollar's worth of work would make permanent improvement of the property. He first sank a shaft and uncovered a pay chute. He realized that the cheapest and best method of developing the mine would be by tunnel, as it would save the cost of hoisting. He began the work of driving into the hill. The task meant over 700 feet of drilling and blasting before he could reach the ledge. He and his partner furnished every dollar that went into the development until it was no longer possible to operate without machinery, when some assistance was called for. The assistance came promptly, and it is probable that by July 1st, '99, the property will be among the dividend payers of the camp.

Near Meyers Falls work will soon begin on the Blue Grouse. This claim was located about thirteen years ago and considerable work has been done, including a tunnel and a shaft. The ore is high-grade galena.—The owners of the Klondike on Mingo mountain will shortly start to develop their claim.—A mining engineer is examining a group of claims on the Hawk's Nest, near Kettle Falls. The claims are the Copper King, Columbia View and Nellie Calder, which have considerable development done. The ore assays \$16 gold, eighty-five ounces silver and 11 per cent copper.—Meyers Bros. on the Sunday group of claims, Gold hill, will soon resume work. Shipments will be made during the winter.

WYOMING.

Near Grand Encampment the Ferris mine is producing ore that runs 60 per cent copper. The ledge is 7 feet wide.

FOREIGN.

BRITISH COLUMBIA.

(Special Correspondence).—The North Star M. Co. are sinking a double compartment shaft on the North Star mine at Kimberly to a depth of 300 feet, and are also clearing the right of way for an aerial tramway from the mine to Mark creek immediately above the town. The Sullivan M. Co. are developing their property to make large shipments as soon as the branch railway line is completed. Fort Steele, Sept. 30th, '98.

J. B. McLaren bought the Tretheway interest in the Providence mine at Harrison lake for \$24,000 cash.

R. T. Ward, Mgr. of the Horseshoe G. M. Co. mine in the Cariboo country, the only one north of California which is using hydraulic elevators, is in San Francisco with \$12,000 in dust, the result of a preliminary cleanup, the cleanup of the main flume not having been made. He says:

"We have over 500 acres of ground and are working two giants on the slope of the bedrock, following it along. We have opened a channel 2000 feet wide and have sluiced off four acres, finding the gold coarser as we go down. There is a good deal of fine gold, but we make no effort to save it. We take our water from two large lakes on Moffatt creek, one of them being nine miles long, and bring it down through five miles of 8-foot canal, one mile of 4-foot flume and three miles of 30-inch steel pipe. As we have no natural dump, we have two hydraulic elevators to create an artificial dump. A large steel feed pipe runs down an open pipe with a nozzle at the end, resting in the bottom of the flume. This nozzle discharges into another steel pipe, which rises vertically for 50 feet to the surface of the ground, where it empties into another flume to carry off the gravel. This latter flume has a steel hood over its upper end. We turn 1000 inches of water into the feed pipe and this stream, shooting out of the nozzle at a pressure of 130 pounds, strikes the gravel as it comes out of the flume and throws it up the elevator. The elevator pipe narrows from 22 to 14 inches a short distance above the nozzle, so that the column of water entirely fills it and keeps the boulders flying upwards. The force of the water is so great that the boulders and gravel rarely strike the sides of the pipe. This is of ½-inch steel and has behind it a cushion of rubber no thicker than paper, which takes off the shock of the blow and prevents the crystallization of the steel."

He says that R. H. Campbell of the Miocene Company has sunk a shaft 400 feet to the old channel on Horseshoe creek, has run down the rim to bedrock, drifted out from that, struck the gravel again and found good pay in it. The Cariboo Gold Fields Company is working with four giants on the south fork of Quesnelle river. They cleaned up \$60,000 in July and expect to clean up \$100,000 more this fall. They are building a dam at Moorhead lake and digging about eight miles of ditch which will cost about \$120,000. The Golden River Quesnelle Dam & Mining Company is building a dam at the foot of Quesnelle lake to hold the water in for four or five months in the year. This will leave the bed of the river dry for four or five miles below and the company will work it.

Since Jan. 1, and with the Le Roi out of the shipping list for the greater part of the time, the output of ore from Rossland amounts to 75,000 tons. The total shipment last year was 72,840 tons.

The Center Star has resumed operations and there are 100 men at work. The War Eagle force is to be increased to 300 and the Le Roi will be working as many men in the next few weeks. These three properties alone will employ between 900 and 1000 men.

At the Center Star work has commenced on a three-compartment shaft. The compressor has been fired and two drills are employed from the tunnel level raising to meet the shaft. There are 100 men at work.

In September the Le Roi shipped 10,208 tons of ore. When the new vertical shaft is in operation the company expects to output 1000 tons daily. At the 700 level the ore body is 42 feet 8 inches in width.

The sale of four big mines in British Columbia was closed in Seattle last week. They are the Esmeralda, Independent and Confederate, in the Trail Creek district, and the

Kennebec in the Fort Steel district. The mines join the Le Roi, War Eagle and Deer Park and are part of the same group. The sale was made by J. R. Rollins, owner, to J. R. Finch and R. C. Caldwell on behalf of the same English syndicate that tried to buy the Le Roi and which owns the War Eagle and Deer Park mines. The price is not made public.

The Rossland Miner says that on a conservative valuation of \$30 a ton the mineral output of that camp for the last week of September was \$125,070.

Rossland Miner: The shipments from Sandon the first week of October amounted to 675 tons. Payne, 350 tons; Ruth, 105; Last Chance, 30; Slocan Star, 120 and Treasury Vault, 40.—From Slocan the Goodenough owners are in 700 feet with their tunnel, and several stringers of fine ore have been struck.

Cory & Ward have bonded the Eclipse to H. T. Bragdon for \$10,000, 20 per cent to be paid in three months and the balance in nine.

Two carloads of ore have been shipped from the Blue Bird mine.—The Minnesota Silver Co. with twenty men is developing the Ivanhoe and has a large amount of high grade ore on the dump.—The Enterprise mine has shipped eighteen cars of ore and has in its bins thirty-two carloads; the ore is taken out entirely in development work.—The Last Chance recently shipped 500 tons of ore. About forty men are employed.—The Sovereign is shipping one car of high grade ore a week.—The Idaho employs ninety men and is shipping one car a day.—At the Queen Bess seventy men are employed and shipments of ten cars a month are made.—The Cariboo-Rambler ships one car per week and employs twenty men.—The Antioch near McLaughlin siding is shipping four cars per month.—The Ruth employs fifty-five men, one car of high grade ore is shipped daily.

MEXICO.

The Rothschild Co., which has acquired the Ingauran mines, Michoacan, has begun work by draining a number of old mines. The work will be carried on on a very large scale. The company also proposes to build an independent railroad line to the Pacific coast, probably to Zihuatanejo.—From the Vantanea mine near Candelaria the lessees are shipping ore running fifty-eight ounces of silver to the ton and fifty per cent copper.—The Escandida mine, Summit station, on the Rio Grande Railway, shipped to the Juarez smelter another carload of gold ore averaging \$65 gold to the ton and few ounces silver.

In the Animas mine near Querobabi, Sonora, the extraction of ore has begun. The property is a good grade gold one.

The Quebradilla mine, from which were taken in five years \$20,000,000, is again in a fair way of producing ore, the drainage works being about completed.

NOTICE TO CONTRACTORS.

WATER WORKS.—Sealed proposals will be received on or before 12 M., November 15th, 1898, for the construction and completion of certain additions to the existing water works, owned and controlled by the City of Seattle. The said water works include a gravity water supply from Cedar River, reservoirs and portions of an auxiliary high-service system in the city. The contract to be let will include the following: (a) Construction of Diverting Weir, Intake Canal (400 feet long) and Settling Basin, Pressure Pipe to City, 42 inches diameter, 28.4 miles in length, of which 6.4 miles are to be riveted steel and 22 miles to be stave-lined, banded with steel bands ½ inch in diameter. High-service Reservoir in City; capacity 16 million gallons. Low-service Reservoir in City; capacity 20 million gallons. Auxiliary High-service Steel Stand-Pipe, 30 feet diameter by 60 feet high, located in Ransome concrete. Pumping Main to Stand-Pipe, 18.200 feet 12-inch Kalamain Pipe; 2900 feet 16-inch Kalamain Pipe; 36-inch Stave Pipe, connecting the reservoirs, about one mile in length; 30-inch Stave Pipe, 3000 lined feet, waste from High-service Reservoir; 30-inch Riveted Steel Pipe, 4800 feet length, connecting Low-service Reservoir with distribution system. Changing Cedar River Channel, 1600 feet, in the city, including the Cleaning, Dam and Connections at Swan Lake, Two Gate-Houses, Specials, Valves, etc. The contract to be entered into will provide that payment shall be made for this work only by warrants upon the "Cedar River Water Supply Fund," established by Ordinance No. 3890 of the City of Seattle, and the contractor shall have no claim against the city except as therein provided. By said ordinance 75 per cent of the cash receipts of the city water system are irrevocably set aside and pledged to the payment of interest at 5 per cent per annum and the gradual redemption of said warrants. In addition to the warrants, which will be issued in payment for the construction of said additions, the contractor will also be required to purchase at par any and all warrants which shall be drawn on said fund by the city in such amounts as shall be required to pay for any real estate, claims, liens, or other matters necessary for the prosecution of the work of construction and the perpetual control by said city of the additions to the water works herein specified, whether obtained by purchase, agreement or condemnation proceedings, and also such warrants as shall be drawn upon said fund by the city in payment of engineering and other expenses necessarily incurred in connection with said additions; provided that the amount of the warrants thus required to be purchased by the contractor shall in no case exceed the sum of Sixty-four Thousand (\$64,000) Dollars. Each bid must be accompanied by a certified check, payable to the order of the City Comptroller, for a sum not less than five (5) per cent of the bid, and no bid will be considered unless accompanied by said check. The successful bidder will be required to enter into a contract and furnish satisfactory bonds for the amount required by the City Charter and the laws of the State of Washington, within ten days after being notified of the award of the contract to him; failing so to do, the said check and the amount fixed therein will be forfeited to the city. No person is eligible as a bidder who has within two years prior to the letting of said contract made default in payment of any just claim, for any work or labor performed, or any skill or material furnished pursuant to any such contract as has been advertised, or who within said two years failed to complete any such contract. Special attention is called to Article XXIII of the City Charter, as now in force, relating to "hours of labor," and to Article XIII, Section 31, Subs. 1 and 2, relating to "hours of labor." All bids must be made in accordance and comply with the plans and specifications now on file in the City Engineer's Office, and in compliance with Ordinance No. 3900. The City of Seattle reserves the right to reject any and all bids. Proposals must be indorsed on envelope "Bids for Constructing Certain Additions to the Water Works of the City of Seattle." By order of the Board of Public Works.

CIRCULAR.

DENVER ENGINEERING WORKS, Denver, Colo., U. S. A.

THE COLORADO IRON WORKS CO., DENVER, COLO.

Established 1860. + ENGINEERS AND MANUFACTURERS OF

Ore Milling and Smelting Equipments.

We beg to call attention to our

High Speed Special Rolls

as being the most efficient and the most economical machine for fine dry crushing ever placed upon the market. The rolls having

**NARROW FACES and
LARGE DIAMETERS**

can be fed evenly over the whole width of faces with certainty, and hence the faces or crushing surfaces are easily kept true. Descriptive pamphlet on application.

HIGH SPEED SPECIAL ROLLS, WITHOUT HOUSING.

Double rope tramways are acknowledged to be superior to those of the single rope type, and any one contemplating the erection of a tramway should investigate the merits of the . . .

**THE ONLY
AUTOMATIC
TRAMWAY
BUILT.**

**FINLAYSON PATENT
AUTOMATIC WIRE ROPE
TRAMWAY.**

In this system the cost of transportation is brought below any figure heretofore reached. Its tonnage capacity is unsurpassed. Further information on application.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs Lumber, Ore, Salt, Borax and other kinds of freight. The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads. Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions. Estimates made for complete Steam Freighting Outfits. Address

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through Dewey, Strong & Co.'s Patent Agency will have the benefit of a description in the Mining and Scientific Press. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

CANTON STEEL COMPANY, Works : CANTON, OHIO.

CANTON EXTRA DRILL STEEL,
WARRANTED.

Canton Drill Steel is a strictly hammered steel made
exclusively from one brand of stock which the experi-
ence of years has demonstrated to be the best for
producing the greatest combination of hardness and
toughness.

There is no mystery in the art of working it. Clean
fire, clean water and the same good judgment employed
in working any imported steel will produce the tough,
strong bit for hard rock mining.

VULCAN ROPEWAY

— WITH —
AUTOMATIC ORE LOADER AND
AUTOMATIC DUMPING DEVICE.

For Conveying
Ore, Cordwood,
Etc.

EMPIRE, NEVADA, April 17, 1896.
Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 13, 1898.

SILVER.—London, 28d; New York, 59%; San Francisco, 60; Mexican Dollars, 47½@47¾. New York exchange, sight, 17½; telegraphic, 20 cents premium.

LEAD.—New York reports "unchanged;" \$3.87½ bid, \$3.90 asked. Local, pipe, 6@6½c; sheet, 6½@7c; pig, 5½c; bar, 6c.

COPPER.—New York reports Lake, \$12.25 @12.37½. Boston *Financial News*, on the copper situation, says it shows improvement. Heavy falling off in the visible supply abroad has been followed by steadily advancing prices in London. At the same time the visible supply of the metal abroad is now down to within a few tons of the lowest figure known since the records have been kept. Owing to the considerable disparity between the European and American scales of quotations foreign consumers have been pursuing a Fabian policy, holding back their orders in the vain hope that by so doing they would face a break in prices this side of the water. In their endeavor to buck against the immutable law of supply and demand they have been unsuccessful. Now they have given up the fight, and late London advices are to the effect that producers are placing heavy orders on a steadily advancing market. The small supply of the metal on hand, all in the control of three parties, assures a further continued advance in prices. There is practically no spot copper to be had. Not only are the companies sold way up ahead, but a number of them—notably the Anaconda and Calumet & Hecla—are believed to have sold more copper than they can deliver, and before many days must come into the ore market themselves as buyers of the metal in order to cover their deliveries. As many of these sales were made on a basis of 11½ to 12 cents, against a present market of 12½ to 12¾ cents, there is little wonder that powerful interests have been trying their best to hold down the copper market and prevent any "unwarranted further marking up the price."

IRON.—American, soft, \$20 and \$22 per ton; Scotch, \$23.

SPELTER.—5½@5½.

TIN.—Menlo Roofing, redipped, \$7; English, to arrive, \$4.50; Pig, 18c; Bar, 19c.

ANTIMONY.—10, 10½.

BABBITT METAL.—10-12-14—best 16c.

QUICKSILVER.—Domestic, unchanged, \$41; export, \$37.00@37.50; carload lots, special rates. On the breaking out of the war with Spain, quicksilver advanced. It has since declined to \$41 a flask and is in good demand. This year has been a prosperous one with all the American quicksilver companies, which are largely owned in Boston.

POWDER.—F. O. B. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1* 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

FUSE.—Triple tape, \$5.10 per 1000 feet; double tape, \$4.35; single tape, \$3.45; Hemp, \$3; Cement No. 2, \$4.35; Cement No. 1, \$3.45.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9.

COAL.—San Francisco coast, yard prices: Wellington, \$8.00; Coos Bay, \$5.00; Seattle, 6.00; Southfield, 7.50.

Cargo lots, Eastern and foreign:
Wallend, \$7.50; Cumberland, \$9.00
Brymbo, 7.50; Cannel, 9.50
Pennsylvania, hd., 14.50; Welsh Anthracite, 12.50
Scotch, 8.00; Rook Springs, 7.60

COKE.—Foreign, \$13; domestic, \$12 per ton.

OILS.—California Castor, pure, cs., \$1.12 per gal.; bbl., \$1.07; pure No. 2, cs., 85c; bbl., 80c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, \$1.11; less than 200 gals., \$1.20; in bbls., 4c per gal. less than case; Baker's Crystal, \$1.50; China Nut, 52c; Linseed, strictly pure, boiled, bbl., 43c; cs., 43c; raw, bbl., 41c; cs., 46c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 38c; cs., 43c; raw, bbl., 36c; cs., 41c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 17c; Astral, 17c; Star, 17c; Eocene, 19c; Extra Star, 21c; Elaine, 22c; Water White, bulk, in tanks, 11½c; Mineral Seal, iron bbls., 21c; wooden bbls., 23½c; cs., 26c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 12½c; do., cs., 13c; 86 deg. Gasoline, bulk, 20c; do., cs., 25c; 63 deg. Naphtha or Benzine, deodorized, in bulk, per gal., 11½c; do., in cs., 16½c; Lard Oil, Extra Winter Strained, bbl., 55c; cs., 61c; No. 1 bbl., 46c; cs., 51c; Neatsfoot Oil, bbl., 65c; cs., 70c; No. 1 bbl., 55c; cs., 60c; Sperm, crude, 60c; Natural White, 65c; Bleached do., 70c; Whale Oil, Natural White, 40c; Bleached do., 45c; Cocoa, cs., 55c; Pacific Rubber Mixed Paints, white and house colors, \$1.25@1.35 per gal.; wagon colors, \$2@2.25.

CHEMICALS.—Cyanide of potassium, jobbing, 30 @ 31c per lb.; carloads, 29c; in 10-lb. tins 37c; sulphuric acid, 2½c per lb. 66% B.

soda ash, \$1.60 per 100 lbs. 58%; hyposulphite of soda, 2½c per lb.; blue vitriol, 4½c per lb.; borax, refined, 5@6c per lb.; chlorate of potash, 9½@10c; roll sulphur, 2½c; alum, \$1.90@2.00; flour sulphur, French, 2½@2½c; California refined, 1½@1½c; nitric acid, in carboys 8c per lb; caustic soda, in 10-lb. tins 15c per lb.; Cal. s. soda, bbls., 65c; sks., 60c @ 100 lbs; chloride of lime, spot, 2.10 @2.25c; salt peter, 15c; chlorate of potash, 25c; caustic potash, 12c.

CANDLES.—Electric Light Candles—6s, 16 oz., 7½c; 6s, 14 oz., 6½c; 6s, 12 oz., 5½c; 6s, 10 oz., 4½c; Granite (Mining) Candles—6s, 16 oz., 8½c; 6s, 14 oz., 7½c; 6s, 12 oz., 7½c; 6s, 10 oz., 6½c. Paraffine Wax Candles—1s, 2s, 4s, 6, 12s, white, 8c; colored, 9c.

NAILS.—List per keg: No. 20 to 60d, wire, \$2.35; cut, \$2.25; 10 to 20d, wire, \$2.40; cut, \$2.30; 8d, wire, \$2.45; cut, \$2.35; 6 and 7d, wire, \$2.55; cut, \$2.30; 4 and 5d, wire, \$2.65; cut, \$2.40; 3d, wire, \$2.80; cut, \$2.55; 2d, wire, \$3.05; cut, \$2.95. In carload lots, 10c per keg less.

Mining Share Market.

SAN FRANCISCO, Oct. 13, 1898.

"Sell what you have if you wouldn't buy it if you didn't own it," seems to be a present effort in the stock market. The shorts seem in the ascendancy. Assessments have been levied by a few of the companies to raise their pledged pro rata of the proposed pumping fund.

Commercial Paragraphs.

THERE are now in course of construction for the Associated Gold Mines of Western Australia, Ltd., four of the largest size Ropp straight line furnaces. They are each 150 feet long by 14 feet wide, and the combined capacity will be about 200 tons per day. Their purpose is to roast the rich sulphide ores of the company, and prepare them for subsequent treatment. The Ropp furnace, since its introduction into Australia by Parke & Lacy Co. of Sydney and San Francisco, has been steadily gaining favor. The Broken Hill Proprietary Co., Ltd., made the first installment in Australia two years ago; and the two 150x14 feet furnaces, which were then erected, have been recently supplemented by a further installment of two others of similar capacity. The Mount Morgan Gold Mining Co., Ltd., has also a 105x11 feet furnace in operation. The principal features claimed for the Ropp are large capacity, economy and simplicity.

Acetylene Gas.

A handsome new illustrated catalogue will tell you where and by whom the new light is being used, and what the verdict is. Mailed upon application. **PACIFIC ACETYLENE GAS CO.,** 115 New Montgomery St., San Francisco.

Assessment Notices.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of September, 1898, an assessment (No. 13) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Nos. 1209 11 Claus Spreckels building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of October, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 1st day of November, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. J. CRAWFORD, Secretary.
Office—Nos. 1209-11 Claus Spreckels building, San Francisco, California.

MARINA MARISCANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of September, 1898, an assessment (No. 13) of 2 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 31st day of October, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of November, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CHARLES BOVONE, Secretary.
Office—217 Sacramento street, San Francisco, California.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of October, 1898, an assessment (No. 21) of three (3c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 106 Leidesdorff street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of November, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of November, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CALVERT MEADE, Secretary.
Office—106 Leidesdorff street, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3rd day of October, 1898, an assessment (No. 11) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of November, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 5th day of December, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
F. METTMANN, Secretary.
Office—237 12th street, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22nd day of August, 1898, an assessment (No. 4) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 916 Market street, Room 57, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3rd day of October, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 31st day of October, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
GEO. W. FLEISSNER, Secretary.
Office—No. 916 Market street, Room 57, San Francisco, California.

POSTPONEMENT.
By order of the Board of Directors of the National Cons. Mining Co., the day of delinquency of the above assessment has been postponed to November 1st, 1898, and the day of sale to FRIDAY, November 25th, 1898.

Office—No. 916 Market street, Room 57, San Francisco, California.

And in accordance with law, and order from the Board of Directors, made on the 16th day of May, 1898, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Room 508 Safe Deposit building, San Francisco, California, on TUESDAY, the 1st day of November, 1898, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Office—Room 508 Safe Deposit building, San Francisco, California.
R. L. CHENEY, Secretary.

To Our Customers and Friends on the Pacific Coast:

Through frequent complaints made to us, we have learned that unprincipled and dishonest dealers on the Pacific coast have counterfeited our trademark numbers and substituted inferior, spurious goods as ours, when ours were distinctly ordered, thus defrauding the customers and injuring our trade and reputation.

Our goods are acknowledged to be the best, and are fully warranted by us, and are marked with our name or initials or with our well-known trademark and catalogue numbers.

We request direct notice if any goods alleged to come from us, or bearing our trademark or numbers, prove to be other than the best, and perfect in every respect, as we will follow up and expose such frauds for our customers' and our own protection. We have no exclusive agents on the Coast, but our goods are obtainable from all respectable dealers in drawing materials, stationery, hardware, artists' material, etc. Respectfully,

KEUFFEL &

ESSER CO.,

If you want your GAS ENGINE to run smoothly by
BEING THOROUGHLY LUBRICATED, USE

Lunkenheimer's

"PARAGON" and "BANNER"
SIGHT FEED GAS ENGINE
LUBRICATORS.

BANNER.

PARAGON.

Specially designed for the purpose. Thousands in use giving entire satisfaction. The "Banner" is made in the following sizes: Nos. 0, 1, 2, 3, 4, 5, 6, holding from 1/4 to 1 1/2 pints; the "Paragon" in Nos. 2, 4, 5, 6, 8, holding from 2 1/2 to 32 ounces of oil. These are simple and practical cups. Specify them and order through your dealer. Catalogue of superior brass and iron specialties free for the asking.

Sole Licensee for the Manufacture and Sale of the

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%." January 2, 1897.

"The furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it." February 19, 1897.

"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The ROPP FURNACE is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (four furnaces); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Spelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

Catalogue on Application.

Single Copies, Ten Cents.

Restraining Barriers.

In '93 California appropriated \$250,000 to build restraining barriers against further advancement of debris in Sacramento valley river beds, contingent upon the appropriation of a like amount by the federal legislature for that purpose. In June, '96, such appropriation was made. This entire work and the expenditure of the half million dollars jointly appropriated is solely under the direction and control of the members of the U. S. Engineer Corps constituting the U. S. Debris Commission. The intent is to impound mining debris and thereby protect the navigable streams of California. Various reports have been made by the Debris Commission, and from a consensus of official opinion the conclusion has been reached that near The Narrows, in the vicinity of Smartsville, Yuba Co., Cal., on a tributary of the Sacramento river, is the most suitable site for the construction of the proposed work. Since the passage of the federal act preliminary investigations have been made there—prospecting, calculating, estimating, boring, etc.,—and the Commission is now in possession of sufficient information to determine how best to begin the work of construction, its approximate cost and accompanying details.

Investigations and surveys at The Narrows dam site have been in progress without interruption, under the direction of Assistant Engineer Hubert Vischer, from the middle of November, '97, to the beginning of last month to determine the depth of the tailings in the bed of the river, the configuration and character of the bedrock and sides of the canyon, the country or formation being broken and such as required detailed investigation to determine the actual

APPARATUS USED IN MAKING SOUNDINGS, BY BORING AND SUCTION PROCESS.

termine the feasibility and cost of a diversion project, by means of which detritus might be conveyed and stored on the plains. Plans and estimates are being prepared and it is expected that a report will be ready to present for the consideration of the Commission, covering the question of storage by means of a dam at The Narrows, about November 1st. But there are methods of treatment other than the one at present under consideration, which will undoubtedly be investigated by the Commission before final conclusions are reached, and surveys are being now made for this purpose.

Little official information has been hitherto given concerning this work, the Debris Commission, in accordance with established custom, deeming it in keeping with the courtesy due the Congress of the United States to first submit its report to that body.

In the work of boring, pebbles three inches in circumference were brought from a depth of 80 feet by the suction process of the boring machine. Pieces of boulder and whole boulders are also among the detritus, of which the Commission has preserved samples. Pieces, too, of the pipe and broken parts of the casing are preserved, showing in a measure the obstacles encountered in the search for bedrock through the tailing pile. The country where these soundings were made, known as The Narrows, is wild though picturesque, and rocky. The gorge is 300 feet deep, from the bed of the tailings to the top of the canyon. The steep hillsides are rocky and dangerous, and amid such rough formations of country the engineer and his employes have diligently carried on their work for many months. The maps, designs and contours prepared for the Commission and for Congress are an exhaustive piece of work and illustrate thoroughly the

THE NARROWS, WHERE SOUNDINGS WERE TAKEN.

RIVER BED, AND EMBANKMENT 300 FEET HIGH.

conditions. In course of the work some twenty-five test holes or borings to bedrock have been made, showing depth ranging from 50 to 85 feet of gravel. To execute this work it became necessary to devise special apparatus, of a novel and interesting nature, there being no well-boring device in use which would have been applicable to the conditions. The depth of

the tailings make the foundation a serious problem and add so much to the expense of the dam that within the limits of the present appropriation only a dam of moderate height could be constructed, the storage of which in the canyon itself would be limited however. Going hand in hand with this project a further project has been under consideration to de-

magnitude of the work accomplished, and that to be considered, in preparing suitable storage reservoir for the detritus. The three accompanying illustrations are from photographs taken by Major W. H. Heuer of the U. S. Debris Commission, and graphically depict the nature of the country and the novel devices used by Mr. Vischer for boring.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Apparatus Used in Making Soundings by Boring and Suction Process; The Narrows, Where Soundings Were Taken; River Bed and Embankment 800 Feet High, 397. The Bartlett Concentrator, 402. Jeffrey Columbian Separator, Screen and Bolter, 404.

EDITORIAL.—Restraining Barriers, 397. Manufacturing Mining Machinery; Which Is Best? The U. S. Floating Machine Shop Vulcan; Existence of Large Lignite Deposits; Hydraulic Project of Carrying Water; The Gib Crane of Mare Island, Cal.; Possibilities for Prospectors in the Yaqui Country; On the Rand; Experiments on Babbitt and Other Anti-Friction Metals; "Drift Mining," 398.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 405-6-7. THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 418.

MISCELLANEOUS.—Concentrates, 399. The Country of the Klondike, 400. The Platinum Metals of Plumas Co., Cal.; A Remarkable Deposit of Black Iron Sand; Silver More Cheaply Produced; The Costliest Piece of Machinery Ever Constructed; California's Supposed Great River of Ancient Times; Red Light, 401. An Eighty-Mile Power Transmission; Accuracy Appreciated; The Bartlett Concentrator; Fuller's Earth; To Eliminate the Water Particles from Steam; The Duty on Lead Ores; An Expert in a Hole, 402. Coast Industrial Notes; Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Recently Declared Mining Dividends; Recent California Mining Incorporations; New Books; Commercial Paragraphs, 403. The Future of the Earth; Jeffrey Columbian Separator, Screen and Bolter; Investigating Pitchblende; Is Darwinism True? 404.

A LETTER from South Africa states that on the Rand the gold mining companies are coming to the conclusion that the only permanent and satisfactory solution of the native labor question is to employ machines and skilled white men to manipulate them, and that air compressors, rock drills and electrical plants will be in increased demand in that region.

COLORADO'S GOLD YIELD for '98 promises to outdo its last year's record. The temporary setback to California's gold product by the drought of '98 may prove of ultimate benefit, as the enforced idleness of the stamps was utilized in extensive repairs and betterments, so that at the beginning of this rainy season the mills, and, in many instances, the mines are in better shape for satisfactory gold output than they had been.

In the issue of the 1st inst., in an illustrated description of the U. S. floating machine shop Vulcan, the repair ship which rendered such effective service at Santiago, this paper suggested that it would now be in order for the U. S. Government to equip a similar vessel on this coast and send it to Manila. A note from Washington, D. C., says that such action has been determined upon, and that a vessel similar in equipment and purpose to the Vulcan will be fitted up at the Mare Island Navy Yard for the purpose suggested.

INQUIRIES are still received regarding the possibilities for prospectors in the Yaqui country. It is said that disappointment is the portion of nearly all who have gone there. The glittering tales are mostly from men interested in travel thereto. "The Yaqui country," which is the valley of the Yaqui river, can be reached from Guaymas; the upper eastern tributaries of that river being easiest reached from Casas Grandes, Chihuahua, Mexico. Undoubtedly placer gold is to be found in that region but not in sufficient abundance to justify serious thought of going there.

TO REACH 25,000 mining men, which is best: to put an advertisement in each of 25 different papers—25 advertisements in all—or 1 advertisement in the 1 paper that these 25,000 men see every week? Why pay more for a thing than it is worth? Or why throw good money away on "official programs," "souvenir editions," and other similar schemes that give no return? Economy in advertising is like economy in everything else—judicious expenditure of money, and the man who wants the worth of his money naturally looks for results, which are the only test of value.

UNDER the stress of competition and the present low prices, the business of manufacturing mining machinery is not a very profitable one, but the recent failure of the leading concern of that kind in

British Columbia occasioned a surprise that is mitigated by some published details of that firm's financing. From the statement referred to it appears that in '95 the company declared a 10% dividend, though owing a local bank \$9640.82; in '96 they paid a 6% dividend, and also \$6002.62 interest. On May 31st, '97, the book debts amounted to \$69,616.11, and bills receivable aggregated only \$124.47; interest paid, \$7749.87. The company report refers to this, which, it says, "will show in itself that there is yearly a 7% dividend waiting for the investment of another \$100,000 in the concern." After a perusal of a few items and statements such as those, failure is not so inexplicable. Such management as that would upset any business in Vancouver, B. C., or anywhere else.

In deep mining heat generated by oxidation is often a factor in determining action, thought not always a permanently deterring one. At Sandhurst, Victoria, it was noticed several years ago, that while, as ordinarily, the temperature increased as depth was attained, the depth was not a regular factor in the increase. It was found to be subject to the amount of pyrites in the ground, and to the time drives in which the temperatures were taken had been opened up. It was ascertained that a fall in temperature of 5° occurred after the ground had been opened up for one year, and it was assumed that this was due to the loss of heat in consequence of the decrease in oxidation. After the ground had been opened up for four years the temperature became nearly permanent. The reefs and sandstones of that region are, however, more than ordinarily free from sulphurets.

THE gib crane of Mare Island, Cal., Navy Yard is an object lesson in the advance of engineering and mechanics. Its working capacity is forty tons at a 75-foot radius. Without reversing or stopping the engine it is capable of hoisting, lowering, turning, traveling simultaneously or independently, and is so arranged by differential gearing that the speed of the outside wheels automatically adjust themselves to the increased radius of the curvature over the inner rail. The traveling speed of the crane is 50 feet per minute; speed of hoisting forty-ton loads, 7 feet per minute; speed of hoisting fifteen-ton loads, 15 feet per minute; speed of slewing or revolving complete circle, two minutes. All gears are of steel. Gauge of track, 20 feet; total width of car body, 24 feet; height from ground to highest point when boom is elevated, 54 feet; weight of the crane, 200 tons; weight of the counter-balance, 120 tons; hoisting steel cable, 1 $\frac{5}{8}$ diameter; breaking strain, seventy-six tons. The entire crane rests upon twenty double-flanged wheels, two of the wheels being drivers, and all of the wheels being so pivoted that the crane travels around the very sharp curve of 66 feet radius.

RECENT Amsterdam experiments on babbitt and other anti-friction metals by Behrens & Baucke are of mechanical interest. By slow cooling this alloy—tin 82, antimony 9, copper 9,—split up into compounds of different fusibility. By pressure between hot iron plates a metallic mother liquid was squeezed out; the remaining cakes of crystalline metal were treated with hydrochloric acid and washed with water. An alloy, containing copper 90 parts, antimony 10 parts, on being thus treated, yielded the same cubic crystals as babbitt metal. In babbitt metal the copper forms brittle needles of whitish bronze containing no antimony. Such bronzes show less stability than the compounds of tin and antimony. From an alloy of 90 Sn 10 Cu, the compound Cu Sn was obtained. Repeated heating and cooling brought the percentage of copper up from 35 to 58. Microscopical examination of bearings show that bronzes heated by running were poor in cubic crystals of the compound Sb Sn₂. Babbitt metal is made amorphous by casting in cold molds. Axles running on such metal get tinned; this leads to sticking and heating; re-crystallization sets in, and liquid tin is squeezed out; while a compact layer of crystals is formed on the axle. Microscopical examination of the metallic deposit from the lubricating oil led to the unexpected result that metal with crystals of moderate size will develop ball-bearings. Tin is ground to a fine dust by the sharp fragments of the bronze needles, the hard cubes of Sb Sn₂ are

rounded, undermined, and finally worked up into something like metallic pebbles of microscopical size. Similar spheroids were obtained from the bearings of another anti-friction metal and of aluminum brass, but not from ordinary brass, nor from gray cast iron.

CONSIDERABLE editorial space has been conceded the extraordinary Australian hydraulic project of carrying water through 328 miles of pipe for the Coolgardie district. The scheme has attracted the attention of engineers everywhere on account of its magnitude and the manifest obstacles. California firms bid with others on the contract. It is of interest to note therewith that, according to the *Australian Mining Standard* of the 15th ult., the Australian Government has decided to accept the bids of G. and C. Hoskin of Sydney and M. Ferguson of Melbourne and Perth as contractors. The Government has resolved to use nothing for the whole distance but Ferguson's seamless pipes, thus doing away with the original proposal to use riveted pipes. The aggregate amount of Hoskin's and Ferguson's bids was \$4,680,000, the original estimate for this branch of the work having been \$5,485,000. Under the new arrangement the total of the two bids will be \$5,125,620. Altogether 61,852 pipes will be required, each 28 feet in length, with a diameter of 30 inches. The work of making these pipes will be equally divided between the two firms named. It is considered that using only the seamless pipes will mean a decreased friction, thus lessening the cost of pumping.

THE existence of large lignite deposits lends local interest to recent experiments reported by the superintendent of the Houston & Texas Central Railway, who describes the results obtained from the use for fuel of lignite, large beds of which are near the main line of that road. Experiments were first made by burning lignite under the boilers at water stations, and later it was found economical to use it at the car shops, the creosoting plant, and under all stationary boilers. By changing the draught appliances it was found that lignite alone could be burned on switching engines, and that a mixture of about equal parts of lignite and coal was suitable for road engines. The fuel records of this road show that in January, '96, in all classes of service, the locomotives made 29.9 miles per ton of coal, at a cost of 11.06c per locomotive mile; while in January, '98, corresponding figures are 28.3 miles per ton of coal, costing 6.41c per mile, or a reduction of 4.65c per locomotive mile. The following comparative figures by years were also given: Average cost of fuel per locomotive mile—'94, 9.55c; '95, 7.99c; '96, 7.68c; '97, 6.54c. The use of lignite was begun in '95. He also states that the expenses for repairs to flues, staybolts and fireboxes have decreased since lignite had been used for locomotive fuel.

An article in the issue of July 30, on California hydraulic mining and, incidentally, "drift mining," a form of securing gold indigenous to California, has elicited numerous inquiries as to the feasibility of success therein, the likelihood of success attending investment in that kind of mining, etc. Few gold mines anywhere and fewer other systems of mining have made bigger money for their followers than drift mining; and the millions extracted are but an index to the amount remaining. This, in the *MINING AND SCIENTIFIC PRESS*, sounds extravagant and hardly in keeping with its careful utterances; but it is the sober truth. Of course, the obvious question occurs at once: "If so, why are these mines not worked?" It is a difficult task to compress a mountain into a nutshell, and as difficult to even briefly outline in small space satisfactory answer. One present reason is that the gold lies in "ancient river channels" heavily capped with lava; that the present owners are mostly poor; that to even reach the channel requires heavy outlay, and that, ordinarily, investors find more immediate return for their money in other ways—not, relatively, as profitable, but giving promise of more immediate return. Not often can be found California miners possessed of such ability as that recently shown by F. Chappet of San Francisco, who was able to secure capital and spend \$150,000 in driving a tunnel over 5,800 feet. The investment paid handsomely, but, while such opportunities abound, few have the money or the nerve to make such splendid success of the project.

Concentrates.

ELIZABETHTOWN, N. M., calls loudly for a custom mill.
VANCOUVER, B. C., wants to establish a mining stock board.
A CYANIDE PLANT is being put in at Yucaipa, San Bernardino Co., Cal.
OVER 2800 electric lights will illuminate Dawson City beginning Nov. 1.

COPPER producers say the metal costs from 5½ to 7½ cents per pound to produce.

THE net profits of La Fortuna mine at Yuma, Ariz., are said to be \$50,000 a month.

THE Old Dominion Copper M. & S. Co., at Globe, Arizona, employs over 300 men.

LOS ANGELES men propose building a copper smelter at San Diego, Cal., of forty tons daily capacity.

REPUBLIC, Wash., miners this week sent \$230 as a gift from that camp to help swell the Olympia fund.

COPPER 80 lbs., tin 12 lbs., lead 8 lbs., silicon copper 2½ lbs., make a fine bearing metal for heavy brass stock.

SOME Slocan, B. C., mines still ship their ores to Aurora, Ill., for treatment at a freight rate of \$19 per ton.

IN the underground workings of the Copper Queen mine at Bisbee, Ariz., there are over sixty miles of car track.

GOV. MURPHY writes that Arizona has now a population of 100,000. That Territory should be granted statehood.

THE California State Mining Bureau will soon move from its present quarters to the San Francisco ferry depot.

THE monthly payroll last week of the Geyser-Marion mine at Mercur, Utah, to employees alone, amounted to \$17,000.

OVER 1000 mining locations have been made in the Goat River district, British Columbia, the past twelve months.

SILVER's highest and lowest London quotation in '91 was in Feb.—46½d and 41½d respectively; in '93, June—38½d and 34½d.

IN Great Britain ores and mattes are sold by a ton known as the "miners' ton," which consists of 21 cwt. of 112 lbs. each, or 2352 lbs.

CAKORUNDUM, a new abrasive, was discovered by E. G. Acheson, in 1891, and is manufactured in large quantities at Niagara Falls, N. Y.

THE production from silver-lead mining in Monterey, Mexico, is said to have increased in ten years from 1000 tons to 10,000 tons per annum.

THE largest pump in Montana is being put in at the Butte & Boston. The water cylinders are 17 in. diameter, 21 in. stroke; total weight, 70,000 lbs.

IN old bonanza days Con. Cal. & Va. ore averaged 54% silver and 46% gold yield. Of recent \$15,696.30 bullion yield, \$6366.83 was in gold and \$7329.42 silver.

HIDDEN in the city dump pile at Leadville, Colo., fifty sacks of ore were discovered last week that aggregated \$110,000, stolen from the various mines.

MINING men visiting San Francisco are cordially invited to visit the MINING AND SCIENTIFIC PRESS office where all may see their home papers, etc.

A REPORT from the California mine superintendent who used 1400-lb. stamps in his mill is to the effect that he found 1000-lb. stamps more satisfactory.

THE Tuolumne, Cal., Independent visits deserved censure on those who tend to injure the mining prospects of that county by dishonest schemes and dealings.

CONSIDERABLE development work is being done in Rhodesia, S. A. On four mines 120 stamps have been placed. Supplies cost about the same as on the Rand.

"YOUR paper has more facts and fewer 'opinions' than any other of which I know," is the criticism received from an Arizona mine superintendent this week.

THE Everett, Wash., smelter has appealed to the United States Court to secure a reduction of a little over \$1000 in duties on 1,500,000 pounds of lead ore.

THE total heat in one pound of steam at 90 pounds absolute or 75 pounds gauge is 1179.6 heat units; with steam at 100 pounds absolute, the total heat is 1181.9.

COLORADO calculates that in '97, 37% of the mining returns went to the investor, 36% to the miner and 27% to the mills and smelters and transportation companies.

THE 7th annual convention of the California State Miners' Association will be held in San Francisco, Nov. 21st. So far but few county delegations have been named.

THE electric power plant at the Homeward Bound shaft and pump of the Omaha mine at Grass Valley, Cal., was put in operation last Saturday and works successfully.

W. F. PIERCE, Pres. Blue Lakes Water Co., says the contemplated electric power line will be completed from Blue Lakes to Stockton, Cal., and be ready to deliver power next January.

THE August gold production of the Rand, S. A., in '95 was 203,573 ozs.; in '96, 213,418 ozs.; in '97, 259,603 ozs.; in '98, 376,911 ozs. Of this, in '98, the deep-level properties furnished 80,000 ozs.

AT the April Fool mine, DeLamar, Nevada, 60% of the gold in the ore is extracted on the plates, the residue cyanided. It is expected that the \$400,000 option on the property will be taken up by Dec. 1st.

AN electric railway from Colorado Springs, Colo., to Cripple Creek, via Manitou, is to be built. The electric railway now in operation between Cripple Creek and Victor is believed to be the highest in the world.

THE appearance of the ore vein at the deepest working of the Wedge mine (415 feet), Randsburg, Cal., encourages the belief that deep mining will prove as profitable there as in central and northern California.

MARCUS DALY wants the Washoe Company's new smelter built at or near Anaconda, Montana. J. B. Haggin wants it built as a starter for a new mining town on the Big Hole river at the junction of Camp Creek.

AT Sudbury, Ontario, the nickel ore is crushed, roasted, and then smelted in water-jacketed furnaces, the charge being eight tons roasted ore to one ton coke, resulting in a 15% nickel matte, exported for refining.

THE unlikely story is floating round that the Carson & Colorado Narrow Gauge Railroad is to be extended from Keeler, Cal., its present terminus, to Mojave, "to connect with the Southern Pacific and Santa Fe systems."

AT Sunshine, Utah, D. Hickman, in the Overland mine, was injured last week by the explosion of a shot that had failed to

go off when set. He was on the lookout for it and used the pick in its search. His face was badly cut with bits of stone and his right eye was destroyed.

THE relative dissolving powers of different gold solvent solutions is stated as follows: Chlorine, 1% solution, 1½ hours, 4.49%; bromine, 1% solution, 1½ hours, 6.46%; cyanide, 1% solution, 1½ hours, 0.57%—60° C. in each case.

IN the mines of Houghton county, Michigan, there are 10,400 men on the payroll, which is 1700 more than were employed at this time last year. Mine Inspector Hall estimates that 2000 more will be employed at this date next year.

SUPT. MARTIN of the Fortuna mine, near Yuma, Arizona, says that their cyanide experiments, conducted to determine the best methods for the treatment of their tailings, "have demonstrated the superiority of the percolation method."

IT will be forty years next January since gold was discovered in Colorado. Since then gold to the aggregate of three hundred million dollars has been mined. Since the gold discovery of '48 California's gold output aggregates thirteen hundred million dollars.

JUST 38 years ago the MINING AND SCIENTIFIC PRESS offered "a reward of \$5000 for a mode or process of separating the gold from the sulphurets" in California. This scrap of ancient history is suggestive and illustrative of the generation's progress in scientific mining.

AT Aspen, Colo., the electric current supplied from a small power house at the Mollie Gibson mine is used in the operation of an underground railway connecting that mine with the Argentum Juniata mine, and furnishes surface and underground lighting for both properties.

SLOCAN ore, all things considered, says the Sandon, B. C., *Paysbreak*, is paying the highest treatment charges in the world. This is not because the galena ore is more difficult to handle, but simply because the smelter men, like the railroads, charge all the traffic will stand.

MR. ORR of Salt Lake City, Utah, says that at the Chloride Point mine, Mercur, Utah, silver is being produced at a cost of 23 cents per ounce, so that at even present quotations there ought to be some hope yet for some Utah and Colorado big silver producers. Mr. Orr's assertion is an extremely interesting one.

EVERY considerable mine should have an accurate plat of all its underground workings, brought up to date by a competent engineer at least once a month, as a measure of economy. In case of adjacent mines working on the same vein, or where water is liable to be encountered, the need for such accuracy is even more manifest.

QUATSINO district, British Columbia, mine owners figure closely on \$16 ore sent to Swansea, where they get \$1.50 per unit for copper and all the gold and silver. Figuring \$9 for the copper, \$1 for the gold, and \$3 for the silver, and deducting \$5 freight and \$5.50 for treatment, leaves \$5.50 to the miner for all expenses of extracting the ore and delivering it on the ocean vessel.

"WATER GAS" is made by passing steam through anthracite coal heated to incandescence, the resultant gas passing to a carburetor where it receives the necessary hydrocarbon from petroleum. In a third cylinder the superheater raises it to a high temperature and frees the gas from smoke. Passing through conduits in which it is freed from sulphur, ammonia, etc., it is ready for use.

THE placer gold of Cariboo and Lilloet, and the Fraser and Thompson rivers, B. C., varies from \$15 to \$18.50 per ounce as a rule. Coarse gold is worth more than fine, and amalgam gold, or that saved by amalgamation with quicksilver, is not worth as much as that which is saved without amalgamating, as no matter how dry amalgam is squeezed and how well it is burned afterwards, a little impurity remains.

IT is locally reported that the Allison Ranch mine, Grass Valley, Cal., will install electricity so soon as the power company has completed the two generators in process of being placed. This mine will then be equipped with electric, steam and water powers, so arranged that all can be used with a combined force, or any one independent of the others. It is maintained that this is the only plant of its kind in existence.

A GOOD fire extinguisher for use in mine buildings, factories, machine shops, etc., may be made by dissolving twenty pounds of common salt and ten pounds of sal-ammoniac in thirty liters of water and filling the mixture in quart bottles of glass, securely corked and sealed. They may be thrown in and around the fire hard enough to break them, and if it has not gained too much headway, will extinguish the flames.

IN the Silver King mine, near Butte, Montana, the shaft is vertical to a depth of 75 feet, and from there to the bottom is an incline. With his candlestick in his hat, W. A. Waller was ascending the shaft; when he reached the junction of the incline and perpendicular, the engineer felt a jar, and applying the brake climbed down the ladder. He found Waller standing in the bucket with the candlestick pressed into his brain, dead.

THE twelve-wheeled mastodon locomotive, with cylinders 21x34 inches, drivers 55 inches, boiler 73 inches in diameter, total weight 212,750 pounds, total weight of engine and tender 308,750 pounds, for heavy freight service on the Montana division of the Great Northern Railroad, weighs, in running condition, over 106 tons. The length of the engine over all is 41 feet 4 inches, and the distance from the rail to the top of the smoke-stack is 15½ feet.

IT is difficult to secure sufficient data to enable builders of large water pipes to wholly and accurately determine the flow, friction, etc. R. G. Blaine, in his work on hydraulic machinery, on this point, says: "It is best to allow a margin for excessive friction, and to guard against repeating such an expensive mistake as that made recently at Newark (East Jersey Water Co.), where about 21 miles of riveted steel mains have to be duplicated."

AT the Sacramento, Utah, mine the gross cost of mining, milling, transportation and refining is stated by the manager to be \$1.04 per ton, "with possibilities of even further reduction." At the Sacramento one-third of a pound of cyanide is used per ton of ore; at the Daisy, Utah, four ounces per ton; at the Mercur, Utah, ten ounces per ton. A Montana paper says that some cyanide plants in that State "use a solution containing five or ten pounds of cyanide to the ton!"

COMMENTING on the recent notice in "Concentrates" of the fact that unpatented mining claims are arbitrarily taxed \$100, J. D. Ludwig tells the *Mariposa, Cal., Gazette* that "one reason why mining men do not like to prospect or sink shafts is that the prospecting hole is taxed what it costs to sink it.

This is a peculiar law; the money paid to laborers is taxed to the party who pays it. A hole in the ground while it adds value sometimes to the property, if gold-bearing quartz is hoisted through it, may take value away from the property by proving it valueless where the hole is sunk. A mine's value should not be determined by what it costs to prospect it. The expense of improving mines should be exempt from taxation."

OF the Witwatersrand, S. A., the *Statist* says that the deep-level companies which are crushing fire as good results as their respective outcrops, thus establishing the value of the main reef series of beds in depth. The actual profits realized and economies effected, in spite of want of assistance from the government, by most of the companies during the last half year establishes the dividend earning capacity of those mines situated on the central section of the Rand.

WHEN boiling hot water was encountered at a depth of 1700 feet in the Comstock, Nev., lode, miners figured that further down all matter was molten, but on passing the 3000-foot level in the shaft of the Combination, Yellow Jacket and Union Cos., the temperature decreased, it being more comfortable at the 3300-foot level than half way up to the surface. In the Lake Superior copper region there appears to be a cold zone, the temperature at 4700 feet being 79° F., but 20° warmer than at the 1st level.

THE principal varieties of mica are muscovite or white, phlogopite or amber and biotite or black, the last being of little commercial value. Most of it in this country comes from New Hampshire and North Carolina. The value of the deposit is the ability to get it out in large blocks and the fineness of its grain. There is a constant demand for it, but it must be in such shape as can be mined in blocks of considerable size and split into even sheets. Canada and India furnish mica in such quantities and at such low prices as to tend to keep down the domestic product.

THE Western Australian International Mining and Industrial Exhibition opens at Coolgardie, March 21st, '99, for ninety days. The object is to obtain a full display of mining and other machinery, and of all kinds of manufactures suited to the requirements of the mining, timber and agricultural industries of the colony. The government of the colony has agreed to frank all exhibits from the port of arrival, to and from Coolgardie, over their railways, and to treat the exhibition buildings as a bonded store, so that no charges will be made for freight or custom dues excepting on goods sold in the colony.

THE total production of lead in the United States during the first six months of '98 was 156,113 net tons, including soft lead, hard lead and the metal obtained by smelting foreign base bullion and ores in bond. During the first half of '98 there were exported 33,439 tons of lead from foreign base bullion refined in bond and 7308 short tons of lead from foreign ores smelted in bond. Reports from nearly all the important producers show a decline in stocks from 17,608 tons on January 1st to 16,760 tons on July 1st. The estimate of consumption for the first half of '98 is 118,767 short tons. Consumption is at the rate of 237,000 tons per annum.

FOLLOWING are two provisions of the law governing the cutting of timber on public lands: "No person will be permitted to fell or remove any growing trees of any kind whatsoever less than 8 inches in diameter. This will not be regarded as applicable to black or 'lodge pole' pine growing in separate bunches upon mineral land. Persons felling or removing timber from public mineral lands of the United States must utilize all of each tree cut that can be profitably used, and must cut and remove the top and brush or dispose of the same in such manner as to prevent the spread of forest fires." The penalty for such violation is in a sum not exceeding \$500 or imprisonment not exceeding sixty days, or both.

THE following table shows the flashing point of hydrocarbon oils used as lubricants:

| Deg. Fahr. | | Sp. Gr. |
|------------|---|---------|
| 318..... | Scotch shale oil..... | 865 |
| 330..... | Rosin oil..... | 985 |
| 330..... | Pale Russian petroleum oil, residuum..... | 910 |
| 330..... | Scotch shale oil..... | 875 |
| 348..... | Russian petroleum oil, pale..... | 896 |
| 358..... | Scotch shale oil..... | 885 |
| 376..... | Scotch shale oil..... | 890 |
| 384..... | Russian petroleum oil..... | 908 |
| 390..... | Pale Russian petroleum oil..... | 914 |
| 392..... | American petroleum oil, pale..... | 903 |
| 422..... | American petroleum oil, pale..... | 915 |
| 428..... | American petroleum oil, pale..... | 920 |

TO ASCERTAIN where the loss in sulphurets occur, a good way is to pass one of the 10,000-grain samples through a 60-mesh wire screen; weigh that which passes through and that which remains on the screen, and pan out each lot carefully by itself, from one pan into another, as long as sulphurets can be recovered; then weigh each batch separately. The use of 10,000 grains is recommended, as every 100 grains is 1%, and each grain is 1-100 of 1%; it is also a convenient size for obtaining accurate results. By using pulp samples instead of tailings the amount of sulphurets in the ore may be ascertained. If the sulphurets assay \$75 per ton, and the quantity per ton is 1.7%, the value of the sulphurets in one ton of ore is found by multiplying \$75 by 0.017, which would be \$1.27 per ton. If the loss of sulphurets in the tailings is 11 grains out of the 10,000 grains sample, and the value of the sulphurets is \$75 per ton, then multiply \$75 by 0.011, and the value of sulphurets in the tailings is found to be \$0.0825 (8¼ cents) per ton of tailings.

THE trustees of the Cal. State Mining Bureau have made their report for the two preceding years. The plan of State Mineralogist Cooper is outlined, hiring an assistant and making maps of the mineral resources of the State by counties. The trustees regret that the Legislature repealed the Act imposing a tax upon the transfer of the stock certificates of mining and other corporations, which yielded several thousand dollars per annum, and was expended directly in the interest of the mines. The last receipt from this source was on April 30th, '97. The trustees complain that there is a lack of funds for printing the bulletins of the Bureau. Lack of funds prevented any display of ores at the Trans-Mississippi Exposition at Omaha. The register showed that there were 58,146 recorded visitors during the time for which the report is made. The laboratory department answered 1381 letters of inquiry, accompanied by specimens during the two years. The total bound volumes in the library number 4493; during the two years 27,250 copies of reports and bulletins have been sent through the mails. During the same period, in addition to the 1381 letters answered by the personnel of the laboratory the librarian replied to 12,500 letters of inquiry touching the mineral resources of California.

The Country of the Klondike.

Written for the MINING AND SCIENTIFIC PRESS by RUSSELL L. DUNN.

During the past summer the writer was for several months in the Northwest Territory of Canada in the region of the gold fields. His observations are intended as a contribution to the gradually accumulating mass of information relating to this little known country.

The particular section over which these observations extended includes the drainage basins of the Yukon and Alsek rivers, lying east and north of the international boundary line between Alaska and the Northwest Territory. In round figures this is nearly 100,000 square miles. Not all of this vast area was personally visited, but the information of many explorers and prospectors has been sifted and compared while in the country. So obtained, I have used it with my direct observations as the basis of the general statements and conclusions advanced.

Topographically and geologically, these two basin areas are a tangled mass of many mountains and ranges. These mountains, mountain systems or ranges are built up on axial lines of uplift at all angles to each other, and so close together that there are neither areas of wide valleys nor of extensive plateaus. The drainage is through long, narrow, crooked valleys. Only in the smaller stream branches and creeks are the streams torrential, and more often than otherwise even in them is the torrential flow limited to the upper portions in short mountain canyons. The present surface of the country is the resultant generally of orographic movements of the earth's crust. It is modified only to a comparatively small extent by subareal denudation. That is to say, the valleys and river channels between the mountain ranges are generally depressions left between the axial lines of the mountain uplifts. They are not valleys and channels of subareal erosion cut in the slope of a single mountain uplift. In this respect the surface is quite unlike that of the auriferous region of California where subareal denudation has been the great constructive force in the development of the existing topography.

The entire country, as a whole, has of necessity been formed by a regional uplift incident to the many lines of axial mountain uplift. Of these latter there are two principal ones. One, separating the Yukon basin from the direct Arctic drainage, is the lesser of the two, the lower and probably will on geological examination be found to be the older uplift. The other, much the greater in magnitude, is the Coast Range on the south boundary line of the Northwest Territory. This entire range and its culminating peaks rise more sharply from base level and are much higher than the ranges and peaks of the interior. The range is cut through by the Alsek river, which, with numerous branches, makes the true coast watershed, not the Coast Range mountains described, but a minor range 100 miles inland. From the main Coast Range there is toward the interior first a sharp drop to the mountain base in the high valleys of the Alsek river system, then a gradual diminishing of mean and summit elevations till the Yukon, Lewis and Pelly rivers are reached. North and northeasterly from these the mean level again rises to the other principal mountain uplift—the Arctic watershed line.

My investigation of the stratigraphy and geological age of the rock formation of the country has been quite limited. The eroded schists on which the Klondike placers are found are said to be of Paleozoic age. I noted schists that are probably Paleozoic at the head of the Nordenskiöld river. South of the Nordenskiöld, in a singular isolated mountain range in the Alsek basin, west of Lake Desardash, I noted metamorphic rocks of probably Jurassic age. Crystalline rocks, granite, porphyry and diorite form the entire mass of many of the mountain ranges and the axial cores of others. In these last the sedimentary strata flanking the summits have been shattered and tilted until in many instances they stand vertical. On the Lewis river and on the lower courses of some of its tributaries are conglomerates and sandstones that I consider to be of either Cretaceous or early Tertiary age. They are not, where I observed them, very thick beds and they are not as tilted or broken as the older rocks. If I am correct in the determination of the sandstones and conglomerates as of Cretaceous or early Tertiary age, it may safely be concluded that the erosion that formed the placers of the Klondike and other localities of the Northwest Territory was Neocene, contemporary with the erosion which formed the placers in California. The organic remains found in the Klondike placers are Post-Pliocene and do not fix the beginning of the erosion. This limitation of time of formation of the placers will be referred to and considered more particularly further on.

The age of the present topography of the country under consideration is pre-glacial. That is to say, the river system was the same then as it is now; and excepting the superficial accumulations of

glaciers, there is no change in the surface by subareal denudation. This condition is a sequence of the short remove in time of the country from glacial period conditions, some of the phenomena of which still exist, though the glaciers to-day are only the scattered fragmentary remains of the enormous ice sheet that once covered this entire north land.

So much has been spoken, written and published with reference to a supposed direct relation between the gold placers and the glaciers that a statement of the true relation, or rather lack of relation, is pertinent.

Beginning with pre-glacial conditions, the climate of the country was undoubtedly temperate, possibly as much so as the coasts of Oregon and Washington now are. The extinct mastodon lived in the Yukon basin just as it did as far south as California. Its bony remains are found in stream gravels (in the placers) in both localities under conditions which conclusively prove them not to have been disturbed since the sands and gravels buried them. Existing contemporary with the mastodon was the mammoth, numerous in northern Siberia on the shores of the Arctic ocean. Possibly, too, some of the bones found in the Klondike gravels are of mammoths instead of mastodons.

The change from pre-glacial climatic conditions to the Glacial period was so sudden as to be cataclysmic. There have been found in northern Siberia, on the surface of the frozen land, the frozen carcasses of mammoths, with partially digested frozen food in their stomachs. These mammoths, the largest and strongest mammals that ever lived on the earth, must have succumbed to sudden intense cold, killing them in the short interval between the mastication and digestion of their food. Then they must have been buried in the snow, steadily accumulating and changing into ice, and never thawing through the vast time interval of the Glacial period. Only with the melting of the ice sheet did the carcasses reappear, and, thawing, finally decompose. The frozen mammoths are thus evidence both of the cataclysmic coming of the Glacial period and of the gradual disappearance of it, a disappearance not yet complete, but continuing. This last is again appreciable in the moderating climate of the Alaska coast region, and the upward retreat of the terminals of many of its glaciers. Some of the latter which a comparatively few years since came down to the sea are now a mile and more away. The frozen carcasses of the mammoths demonstrate another important fact, namely, that the ice blanket of the Glacial period was not everywhere a glacier, a moving mass of ice. All over the far north lowlands bordering the Arctic ocean in Siberia and Alaska, all over the interior of Alaska and Northwest Territory in the Yukon basin, the snow must have cumulated and changed into ice in place, and must have melted and disappeared from place without disturbing by erosion the surface of the frozen earth beneath. Only when this vast ice mass had melted from off the plains and lower summits of mountains and hills did glaciers commence to move in such of the stream valleys as headed in the higher mountains. These glaciers, commencing to move, then, under the moderating climatic conditions, enormous in extent at first, gradually diminished upward by the steady gain of solar heat on the accumulated ice, till at the present time most of them have disappeared altogether, and the remainder are only ice patches high up toward the mountain summits. The work done by them remains, much of it exactly as it was left by the retreating ice mass.

These glacial remains are a characteristic feature of a portion of the Northwest Territory. As explained, only commencing to form after the vast mass of the Glacial age ice sheet by melting in place had exposed the low northern plains and lowest mountains and hills just as they were in the pre-Glacial period, the glaciers in the stream valleys which they occupied gathered up the stream sands and gravels and the lake beds, and, adding to them the products of their own erosion from rock in place, deposited the unassorted, unconsolidated mass in enormous moraines, terminal and lateral, the latter forming great terraces, lining the valleys for hundreds of miles. A very large number of glacial lakes and ponds have been glacier formed, some by the cutting out of the solid rock, but more in the closed basins of the moraines. With the disappearance of the glaciers the streams flow again between their old hill rims, but not necessarily in their old beds. Quite generally they flow on beds formed of the distributed moraine drift. The Lewis river in places leaves its old channel, filled several hundred feet deep and a mile or more wide with moraine accumulations, and flows in a new channel cut from the old country rock rims. The Five Finger and Rink rapids are in such new rock cut channels.

Summarizing, the surface of the Northwest Territory under consideration can be comprehensively classified for consideration in detail as follows: First, that portion of it lying adjacent to and north of the main Yukon stream, including the gold fields of the Klondike and its tributaries, from off of which the ice sheet of the Glacial period melted without ice erosion, this being the low-lying area referred to in the preceding. Second, the moraines and terraces that fill and line most if not all of the large

southern tributaries of the Yukon, including the Lewis river and its branches, and which fill and line many of the smaller tributaries of the region, these being the areas of which the surface has been changed during the Glacial period. Third, the summits of the hills and mountains from which the ice sheet disappeared in place, but which rise from the valley containing the glacial drift. These summits and slopes show no traces of glacial erosion and contributed very little to the moraine deposits alongside of them. And, fourth, the high mountain slopes where direct glacial erosion is still going on.

The relation of the preceding to the gold placers is this: Gold placers are the resultant of denudation of gold-bearing rocks in place, and as such are found in stream beds, where water now flows, or where it has at some previous time flowed. The presence of gold alone does not necessarily make a placer. It must be a commercial quantity for which a miner may reasonably risk his labor and capital. Conforming to these definitions, gold placers can only be anticipated in the surface areas of the Northwest Territory that are in the first or third classifications. That is to say, they can only be anticipated in the stream channels of those northern areas from which the ice sheet of the Glacial period has disappeared by melting in place. They cannot be anticipated in those stream channels which have been swept by glaciers, nor can they be anticipated in the vast masses of unassorted glacial accumulations in moraines and terraces. There are, it is true, exceptional conditions under which a glacial accumulation may be a placer. There are a number of such in California, Nevada and on the Alaskan coast, but from my observation I am of the opinion that the special exceptional conditions for such placers do not exist in the Yukon basin. The colors of gold that the prospectors obtain everywhere on these glacial drift deposits, where there has been some surface concentration by water flow since the disappearance of the glacier, are not indicative of rich placers at the bedrock, nor of commercial values in the gravels. A glacier does not assort or concentrate the deposits it leaves, as it retreats upward from the sea level. It grinds the gold particles from rock in place just as it grinds the rock particle and it drops them just as impartially into its slowly growing moraines. Only where the total value of the gold particles so eroded bears a commercial ratio to the barren rock volumes eroded with them can there be a placer. With stream deposits this commercial ratio is created by the elimination of the barren rock by concentration. So far does this concentration extend that many moderately rich gold placers contain, with practically all of the gold originally in the rock in place, only 100,000 part of that original rock eroded with the gold.

Consideration has been given by me to this in detail because I observed both personally and heard of tremendous wastes of time, labor and money, expended in the effort to find placers in the glacial moraines and terraces where it was impossible they should exist. On the Lewis, Pelly, Big Salmon, Nordenskiöld, Alsek, Copper and other streams, hundreds of shafts were sunk seeking gold-bearing stream channels that did not and could not exist. Leases were bought from the Canadian Government to dredge stream bottoms that were nothing but gold barren, glacial moraines. Not alone were "tenderfeet" deceived by these vagrant, so-called grass root and surface colors, but experienced placer miners from California, Montana and far-away New Zealand wasted their labor and money and the summer season of 1898 hunting for placers that could not exist where sought for. On the Lewis river, about fifty miles above the junction with the Pelly, I found miners sinking shafts through frozen moraine gravels for the old channel of the Lewis river. At the surface a small tributary stream had cut down a deep terrace to the river level. The new surface yielded colors concentrated from the drift washed out; but, once below the surface, the shaft gravels showed no prospect or only an occasional color. It cannot be too thoroughly understood that the areas within which it is physically possible for placers to exist are limited. Below or above glaciation are the areas. The Klondike and adjacent basins are areas below and Lake Atlin and Shorty Creek district are areas above. There are other areas than these noted where there might be placers, but no other placers have as yet been found.

All the placers yet found—the Klondike, Lake Atlin and Shorty Creek district—are exactly what typical placers are and have been in every other placer mining district in the world. They are the natural stream concentrations of the stream erosion of gold-bearing lodes and their enclosing country rocks. They are not sea or glacier erosions or tidal concentration of auriferous sands in beaches, for such placers are exceptional. As between placers of the typical description, the differences are not of kind, but of degree. With the Klondike placers there is no variation from the common type. That they are frozen does not imply a difference of genesis or geology of the placers necessitating the establishment and application of new theories to expert their location and value. All it implies is a possible difference in the economic method of exploitation.

(To be Continued.)

The Platinum Metals of Plumas County, Cal.

TO THE EDITOR:—The interesting and instructive paper by Mr. Helmbacker, published in your late issues, relating to the occurrence of platinum in the Ural mountains, suggests the following notes on the platinum metals of Plumas county, Cal., which may be of interest to your readers at this time, when manufacturers are eagerly inquiring about our resources in platinum, and especially in the osmium alloys:

Platinum, with iridium, osmiridium and iridosmium, has for many years been found in several of the deep gravel channels of Plumas county and in some of its surface gravels, always on or near the great serpentine belt, which traverses the county from N.N.W. to S.S.E. They were noted in the early days in the bed of the North Fork of Feather river at and below Rich Bar, and along the river as far south as Oroville, in Butte county. At the southern boundary of the county, platinum is found in Slate creek, chiefly in its tailing deposits, which contain enough of the metal, in conjunction with gold, to pay a good profit on the collection. The La Porte deep gravels also contained a small percentage.

The chief source of platinum and its allied metals within the county is found both in the recent and older gravels of Spanish creek and its tributaries, many of which take their rise and have eroded their channels in the serpentine. Not less than three of the ancient hill channels cross Spanish creek at different points of its course. One of its branches, Silver creek, derived its name from the find of a piece of platinum in its bed in 1853, when it was supposed to be silver.

The writer has found platinum, iridium and iridosmium within the county, and chiefly near Spanish creek. Twenty-three years ago, during the active hydraulic work of the Plumas Mining and Water Company at Gopher Hill, under the management of the late N. Cadwallader, about six ounces of platinum was collected at the cleanup of one season, the most of which was in thin scales averaging $\frac{1}{16}$ inch in diameter. In general the metal occurs in thin scales, in rounded granules or irregular thicker grains, from microscopic sizes up to $\frac{1}{2}$ inch in diameter, the coarsest being found in the shallow surface gravels of Spanish creek, near Green Flat. It is, however, rare to find a piece the size of a wheat grain. In quality the platinum occurs of all grades, chiefly alloyed with iron up to 10 per cent, in which case it is attracted by the magnet. Grains of pure iridium are rare. Iridosmium in its various alloys is present in varying amounts up to about 10 per cent of the crude metals. Ruthenium and palladium as alloys are present, but have not been determined quantitatively. The largest piece of platinum noted by the writer as found within the county, weighed twenty-eight grains. The platinum metals of Slate creek generally run in sizes from $\frac{1}{16}$ inch to microscopic particles, the latter predominating.

Platinum has not here been found in place, but no special effort has been made to investigate its genesis. As having a bearing on the subject may here be mentioned some statements made to the writer by two intelligent and reliable miners, to the effect that they had each found, independently and at different localities, native gold and platinum apparently firmly welded together, and with a well-defined line of junction. In one case the piece of gold-platinum was said to have weighed nearly one-fourth of an ounce. In both cases it was held certain that mercury was not present, as the metal was heated, but not otherwise tested.

Chromic iron is always abundant in the platiniferous gravels, both as sand and as pebbles, and occurs occasionally in place in the serpentine as lenses and short gash veins. It is highly probable that our platinum metals may be traced to this mineral, in which it sometimes occurs in Siberia.

The quantity of the platinum metals is always small in proportion to the gold contents of our gravels. In general, it may be estimated at $\frac{1}{10}$ to $\frac{1}{2}$ of one per cent of the weight of the gold obtained with it. Very rarely will it reach $\frac{1}{2}$ per cent. As no trial has been made on a large scale, this estimate, however, is not conclusive, being chiefly based upon tests of gold-bearing black sand. In the black sands of this region the platinum metals form a much higher percentage in proportion to their gold contents, and in one instance reach 50 per cent by weight.

Unless the market price of crude platinum, osmium and iridium should advance very much, it will not be profitable to collect these metals here, except in a few instances. The tailing deposits of Slate creek would probably yield a fair profit from this source, if properly handled. Besides that locality, the writer knows of only two gravel deposits within the county where the collection of platinum metals may be made profitable, but solely in conjunction with the gold values obtained with them.

The platiniferous sands here always carry cinnabar in very small quantity, in small grains and crystals, a testimony to the common genesis of these two minerals.

Rocks closely related to serpentine seem also to be

productive of the platinum metals. A small deposit of quartz gravel at Dean's Hill, near the southern border of the county, rested upon a steatite or soapstone bedrock, which forms a large irregular body several miles in extent, intervening between the granodiorites of southeastern Plumas and the granite of Butte county. This deposit, long since worked out, contained fine sealy gold, and the platinum therein found in nearly the same physical condition as the gold, formed a proportionally higher percentage than is presented by any platiniferous gravel deposit within California, with which the writer is familiar.

J. A. EDMAN.
Meadow Valley, Oct. 3d, '98.

A Remarkable Deposit of Black Iron Sand.

Written for the MINING AND SCIENTIFIC PRESS by OSCAR H. HERNSEY.

On the southern or Pacific side of the Isthmus of Panama, between about thirty and fifty miles west-southwest of the city of Panama, is a white sea-cliff 100 feet in height. At its base at low tide is exposed a broad beach of fine sand, the color of which as seen from the ocean is a yellowish-white except for many large black patches of irregular outline. Upon landing on the beach near the town of San Carlos these black patches were found to be composed of "black sand"—the black oxide of iron—the purest kind of iron ore. The fine, bright, black grains are a prominent constituent of the sand in the entire beach deposit; but by the action of the waves, they have been concentrated in places into beds of almost pure magnetite. I dug 6 inches into one bed consisting of pure black sand. At another place a small creek issuing from the interior crosses the beach in a ditch several feet deep cut into a bed of mixed white quartz sand and black magnetite sand in which the latter predominates. Indeed, I have no doubt that many areas, acres in extent and 5 to 20 feet deep, could be found in which the iron sand would constitute more than 50 per cent of the whole.

No effort has yet been made to utilize this great deposit of comparatively rich iron ore. Were it in the United States, and situated near fuel and limestone, it undoubtedly would be of considerable economic value. If New Jersey ore, which contains only 14 per cent of metallic iron, can be worked at a profit (when concentrated by the Edison process) in a region where pig iron costs but \$10 per ton, any deposit such as the iron sand of the San Carlos beach within easy reach by water of Pacific ports, where the price of pig iron is \$20 per ton, ought to be worth working, provided cheap fuel and limestone are near.

Both coal and limestone exist on the isthmus, but not in the near vicinity of the San Carlos magnetite sand. The problem of its cheap working can only be solved by washing out the quartz sand or by using the Edison process of concentration, and carrying the pure black sand in ships to some point on the western coast of America, where fuel and limestone are within easy reach. When the people of the isthmus awaken from their long commercial lethargy and build railroads and make other iron-consuming improvements like other civilized people, the remarkable deposit of iron sand in the San Carlos beach will be utilized.

Oct. 3rd, '98.

Silver More Cheaply Produced.

TO THE EDITOR:—I herewith take the liberty of drawing your attention to an error which appeared in "Concentrates" of your issue of Oct. 1st. You say: "In Mercur, Utah, gold is produced from the mine cheaper than silver can be there so produced." This is not the case. From the majority of the mines in the Mercur district, gold is produced at a cost of, approximately, \$8 per ounce, while at the Chloride Point mine, under the management of Mr. Gill S. Peyton, and by the use of the MacArthur-Forrest cyanide process, silver is being produced at a cost of 23 cents per ounce.

Wm. Orr.
Salt Lake City, Utah, Oct. 11th, '98.

P. T. DODGE, of New York, has presented to the museum of the Sibley College of Engineering what is probably, for its size, the costliest piece of machinery ever constructed. This is the Paige typesetting machine, the one in which Mark Twain sunk a lot of money. It consists of 19,000 pieces, controlled by a keyboard, and handles ordinary type, setting, justifying and distributing the matter, and leading it also, when required. It is believed to be one of the most beautifully ingenious pieces of mechanism as well as the costliest. The trouble with it commercially is that it is too ingenious, and, although perfect in the operation, cannot be built for sale. Of course, most of the two millions of dollars this, the original machine, is estimated to have cost, was used in the incessant changing and remaking in which years were spent. The machine occupies a floor space of 11½x3½ feet, and its highest point is 6½ feet from the floor. The weight is a little less than 5,500 pounds, and it runs without a perceptible vibration.

California's Supposed Great River of Ancient Times.

TO THE EDITOR:—A great many hydraulic miners have been very much interested in the finely illustrated two-page article in yours of July 30th, about gold in ancient river channels. After years of research and careful investigation, geological theories with their various ages and fossiliferous evidence are sometimes confronted by other opinions, although not directly in touch with the many branches which go to make up its learned chart, yet we cannot always be too precise and disregard a logical argument from a practical standpoint, especially from men of intelligent speech.

During many trips through various mines of California I have often met the benign-faced miner of '49 who neither possesses nor lays claim to the title of "mining engineer" or "mining expert," but regardless of the absence of these, in some cases assumed, titles, these miners are intelligent and interesting, and have ideas of their own regarding the auriferous deposits of California that compare in reasonable composition with the others advanced by learned scientists. These do not follow the laws of "cause and effect" or the "survival of the fittest," being taken from personal observations which embrace many years of patient toil, hardship and research.

Previous to the Jurassic age our ocean coast line extended far into the interior and even over the seat of the various mountain ranges east of the Sierra Nevada, yet unborn. The presence of the impression of the ammonite fossil in some of the slates and also that of the belemnite go to substantiate the belief that the noble Sierras were born in the Triassic or Jurassic age. During this age the Sierra foothills formed the shore of the Pacific ocean, and the verdure-clad mountains of the Coast Range lay slumbering in the bosom of Mother Earth until the renewed activity of Cretaceous age forced them to the surface. This is as far as we can go geologically. This treats simply of the primitive formation of the coast and leaves the presence of the immense deposits of gravel, which in many cases overlay the summits of ridges, to be attributed to ancient tributary channels. To this the same old miners do not agree. One will say: "I've mined from the Mexican line to British Columbia and found the same gravel deposits in both directions, north and south. This gravel, I claim, had not been deposited altogether from the many small streams which have their rise in the mountains, but chiefly from one vast river whose bed now forms a portion of the makeup of the Sierra Nevada range. To the objection that this theory will conflict somewhat with past opinions and accepted truths, I may make reply that had others made the proper investigations, they might learn different." When we come to gaze over the great width of the Sierra range, it permits of a large number of geological possibilities. To be convinced of any extravagant ideas as to the presence of an ancient waterway of large dimensions, having its main channel through the central portion of the range, may tax the imagination of many who have studied the various forms and deposits of auriferous gravels, but an argument for or against its existence would not read any more inconsistent than the hypothesis which has been launched for consideration from the minds of many learned men on other subjects pertaining to geological science. An "Amazon-like" stream might have caused great denudation and cut into the surface so deep that the crust yielded easily to the dynamical action which was so prevalent in past ages, the result being one tremendous upheaval and the lifting of the gravel and other debris deposits which had accumulated during the life of this mighty river far up into the mountains and diverting its immense discharge into new and virgin channels.

In giving consideration to the theory in question, if we entirely disregard the idea of the presence of such a waterway we leave the long epochs which embrace the Jurassic age previous to the Cretaceous without any main river system, such as is represented by the Sacramento and San Joaquin rivers of the present day.

In speaking of the ancient gravel beds the title of "old channels" is customary with most people, simply attributing the deposition to the smaller mountain streams and thus scouting the idea of any great proposition that may have existed in past ages.

If one accepts as a fact the elevation from the direction of the pole during and preceding the first Glacial period, an immense body of water could have been discharged southward during the long period it took before a complete subsidence to the primitive level occurred, thus giving cause for the supposed large stream which may have had its rise in the far north with a southward course through the interior of the primitive formation of our present Sierra Nevada range.

HYDRAULIC MINER.

RED LIGHT is not the lowest kind visible to the eye. When a body is heated up it emits first a "gray" glow and then a red glow. Herr Lummer finds that this gray light is perceived by the "rod" formation and the real light by the "cone" formation in the nervous structure of the eye.

An Expert in a Hole.

Under the above heading the Cairns *Morning Post*, Queensland, Australia, publishes the following, which is not wholly new but well told: "Several smart mining 'experts' have been trying on a little game with the holders of good copper or tin properties in the Herberton or Chillagoe districts. Their mode of operation is very simple. They go to the holders and say, 'Look here, my name carries weight down south, and if you don't let me into this mine I will send word down that will prevent you selling.' One or two miners have been soft enough to bite, but in at least one case an expert was badly taken down. Two men were sinking on a big lode of copper not 100 miles from Calcefer, when an 'expert' came along. Both miners were on top at the time, and to them the 'expert' unfolded his mind. 'Well, yes! and if we let you in you will boom it along?' they asked. 'Of course,' replied the expert. 'I will do whatever I can for you, and as the Blank Syndicate are already nibbling at your claim, I can get appointed to examine and report on the mine.' 'Well,' replied the miners, 'you had better have a look at the reef as she is in the sink, and then you will know what you are doing.' To this proposition the expert acceded, and was lowered down the straight shaft 40 feet to the bottom. He put in a quarter of an hour knocking off bits of the lode with a gad, and after gathering them up to put in the bucket, he discovered that the oildrum had gone to the surface. In response to his cries of 'lower away,' one of the owners of the claim looked down the shaft and asked the would-be-expert what he wanted. 'I want the bucket,' replied the man in the sink. 'Oh, you do, do you? Then you are likely to want it for a long time.' 'Why, what's up?' anxiously queried the expert. To which the man on top replied, 'Your game is up and the bucket is up. And what's more, it is going to stay up.' Then a long confab took place between the expert and the miners, with the result that at the end of an hour or two a pen, ink and paper were lowered to the bottom by a long cord, and the expert sat down in the sink while he wrote as follows: 'I, _____, herewith admit that I threatened Blank and Blank to blackmail their copper mine unless they consented to give me a share in said mine; that in consideration of their giving me such share I would manage to get engaged by the Blank Syndicate to report on such mine; that I would boom it for all it was worth, and that I would engage that my report would result in their obtaining at least 100 per cent more for their property than they would otherwise obtain from the Blank Syndicate. I also admit that I am a blackguard, a thief, and a liar, and am unfit to associate with the honest miners on the field. Signed Blank Blank.' When this document reached the surface per medium of the cord before-mentioned, the unhappy expert was hauled safely to the top, but his stay on the Chillagoe field was a short one. He left hurriedly for the south by the Cintra on Saturday."

The Duty on Lead Ores.

The San Francisco MINING AND SCIENTIFIC PRESS, discussing the duty imposed on lead ores and pig lead by the United States government, does not hold out much hope of the duty being removed or even modified. Though not put plainly forth, the PRESS leads it to be inferred that a Canadian export duty on lead ores would not be advantageous to Canada, and we are treated again to the flat and stale argument that "under our existing tariff"—that is, the United States tariff—it pays the Canadian miner better to ship the ore across the border than to smelt it at home. The PRESS leaves this part of the question there without any attempt to make this very abstruse matter plain. It then goes on to say that American miners would be pleased rather than otherwise to have the Canadian government put an export duty on the ores referred to. Probably so; but the owners of smelters and refineries would not. However, that is not the question. Probably if the duty should be imposed the PRESS would sing another tune. What Canadian mine owners have to consider is not what will prevent United States smelters and refiners from deriving most of the profit, but how best they can act to derive the full benefit of the working of their properties without being subject to tariff exactions. It has been the stock argument of interested persons that the natural market for Canadian ores and lead products is the United States, but when a natural market imposes restrictions which are all in its own interest, that market becomes an unnatural one for the foreign producer, and it behooves him to look around for a more profitable one. By treating their own ores in their own country, and exerting themselves to find a market, mine owners in this province can place themselves in a much better position than they are in now. There are markets in the east—Canada and Great Britain—and in the west—China and Japan—which will take all the lead products

Canada can give them, and trade in these directions would not be restricted in any way. To relieve their present disabilities the mine owners have matters in their own hands. Concerted action on their part will secure them the protection which should be theirs by right.—Nelson, B. C., Miner.

The Bartlett Concentrator.

There is always something new in the mining world among the appliances. This time it is in concentrators. F. L. Bartlett of the American Zinc-Lead Co., Canyon City, Colorado, has brought out a new concentrating machine, in which he reverses the usual

THE BARTLETT CONCENTRATOR.

order and removes the finer material first, and using less water and more agitation. The Parke & Lacy Co., 21 and 23 Fremont St., San Francisco, represent the concentrator on this coast and will send anywhere, upon request, a full description, how it is set up and run, etc.

E. LEPIK of Warsaw, Russia, has invented an apparatus to take the place of the valve for eliminating the water particles from steam during its passage from the boiler to the cylinder. It depends for its action upon the principle of centrifugal force. The steam is passed through a turbine fixed in the inner part of the drum. Owing to the centrifugal tendency caused by the turbine, the water particles are separated from the steam and descend through a tube into the water of a boiler, the dry steam passing through another tube into the engine cylinders. The steam pressure being less than the pressure within the boiler causes the steam to flow through the turbine into the drum, and, passing through the turbine channels in a tangential direction towards the circumference of the drum, causes the centrifugal force to take effect on the particles of steam. This force produces a tendency in the water to describe large circles, thus collecting on the walls of the cylinder, while the steam, being lighter, acquires a rotating motion in the middle part of the drum. Then in the dry state the steam passes through the tube into the engine cylinder.

THE presence of gold nuggets in a river bed has been regarded, apparently, in some quarters as a mystery, which a Slavonic chemist named Zsigmody has now "solved." He shows "that gold itself can exist in a soluble form. By acting on a slight alkaline solution of a gold salt with formaldehyde and submitting the product to dialysis he has succeeded in obtaining gold in a colloidal condition, in which state it is soluble in water and may be precipitated by the addition of common salt. It is probable that some of the gold in quartz reefs exists in this condition. It is washed out by the rain, carried away in solutions by the rivers, and deposited in the river gravels wherever there is anything containing salt to cause its precipitation. In the course of ages a large nugget may in this way be formed."

THE rule laid down by the U. S. Land Department as to what constitutes mineral land is that whatever is recognized as mineral by the standard authorities where the same occurs in quantity or quality to render the land in question more valuable on its account than for agricultural purposes, is mineral within the meaning of the mining law. The term "valuable minerals," since the passage of the Act of May 10, 1872, has been defined by that department to include borax, and alkaline earths, sulphur, alum, asphalt, fire clay or kaolin, gypsum, limestone, building stone, and also all lands containing valuable deposits of stone that is useful for special purposes, and petroleum or oil lands.

An Eighty-Mile Power Transmission.

In last week's issue was noted the fact that in California long distance electrical transmission is receiving unusual attention, more especially, at present, in the southern part of the State. In these days of electrical progress the California enterprises are considered worthy of prominent notice in every technical journal. In the issue of the 15th, among other long-distance projects, was instanced that of the Southern California Power Co., which is designed to transmit electrical power to Los Angeles, Cal., a distance variously stated at from 80 to 81½ miles. This is believed to be the most important

electrical power installation (as regards length of transmission) so far undertaken in any part of the world, and is now nearing completion.

The station is located about eight miles from the town of Crafton, Cal., and consists of four 1250 H. P. Pelton wheels, direct connected to the shafts of General Electric generators, 750 K. W. each. The wheels are 82 inches in diameter, operate under 700 feet effective head, and run at a speed of 300 revolutions per minute. There are also three 24-inch Pelton wheels, capacity of 75 H. P. each, running at 1000 revolutions per minute, direct connected to exciters.

The water supply is taken from the Santa Ana river and Bear creek—the point of diversion being at the junction of the two streams. It is thence conveyed through canal and flume about 17,000 feet, a large portion of this distance being tunneled through solid rock. From the terminus of the canal to the power station, the water is carried in two 30 inch steel pipes, each 2210 feet in length, which discharge into a receiver at the power house 30 inches in diameter by 100 feet long. The receiver is made in two sections, connected in the center by a 30 inch cast steel gate. Each pipe line connects with a section of the receiver at right angles by lateral steel branches. The upper portions of the pipe lines are riveted sheet steel and the lower portions lap weld—the latter being one-half inch in thickness.

The transmission line is eighty miles long, composed of two circuits of No. 1 B. & S. gauge medium hard-drawn copper wire, supported on triple petticoat porcelain insulators, and is intended to carry a pressure of 33,000 volts. The power generated is to be transmitted to the city of Los Angeles, and used for running an extensive system of tramways, as also for lighting and general power purposes.

The hydraulic part of the work has been furnished by the Pelton Water Wheel Co. and the electric equipment by the General Electric Co.

Fuller's Earth.

TO THE EDITOR:—Referring to an item on Fuller's earth as having been found in Kern Co., Cal., in last week's issue, I have personal knowledge that there was found about three years ago, several miles east of Tallahassee, Florida, a large body of Fuller's earth, which was being mined and shipped in considerable quantities soon after discovery. The principal use for it, I believe, was in purifying refined petroleum. A SUBSCRIBER.

San Francisco, Oct. 18th, '98.

Accuracy Appreciated.

Just one word for the MINING AND SCIENTIFIC PRESS, published weekly in San Francisco. It is not only the oldest and best mining paper in the West, but it speaks of the mines at Victor, when the mines in question are at Victor, and does not, as many of the Colorado papers do, mention everything as "at Cripple Creek."—Editorial in Daily Record, Victor, Colo., Oct. 12.

A SQUARE INCH of cast iron will carry about one-half as many lines of force as a square inch of wrought iron. A square inch of mild steel will carry from within 10 to 15 per cent of the lines of force of wrought iron without involving the use of heavy magneto-motive forces.

DAVID McCULLUM, New Brunswick, N. J., claims to have discovered a substitute for Para rubber. He says he can manufacture a rubber substitute that will cost but 9c a pound, whereas genuine Para rubber costs \$1 a pound.

Coast Industrial Notes.

—Palo Alto, Cal., has voted to issue \$40,000 sewer bonds.

—Near Chino, Cal., are daily quarried 20 tons limestone.

—Hawaii, U. S. A., proposes to quadruple its sugar output by 1902.

—The Northern Pacific Railway is completed to Hoquiam, Wash.

—The McCloud River, Cal., Railway is being extended to Bartles.

—Washington estimates the total hop crop of the State this season at 30,000 bales.

—Spokane, Wash., Portland, Or., and San Francisco are now connected by long-distance telephone.

—Pasadena, Cal., proposes to put in a large pumping plant and develop 1000 inches of water to sell.

—The \$20,000 Colton, Cal., 6% 20-year average gold water bonds have been taken in Los Angeles at 107.88.

—The Snoqualmie (Wash.) Falls Power Co. are going ahead with the work of piling and wiring part of the route.

—Nearly 100 men are employed at Point Wilson, near Port Townsend, Wash., on government fortification work.

—The Sugar Trust is reported negotiating with the Hawaiian planters for their sugar crop for the next three years.

—The Union Oil Co. of California proposes to operate a pipe line from the Calleguas ancho to Ventura, twenty miles.

—The largest salmon cannery in the world is at Blaine, Whatcom county, Wash., with a daily capacity of 384,000 one-pound cans.

—Myrtle logs are shipped from Marshfield, Or., to San Francisco by S. R. Davis for the Union Iron Works for blocking in the new dry dock.

—Four lime kilns are kept steadily burning at Roche Harbor, Wash. A shipment of 8000 barrels of lime was recently loaded from that point.

—The San Francisco & San Joaquin Valley Railroad will pass into the hands of the Atchison, Topeka & Santa Fe Railroad about an. 1st, '99.

—Blair & Barnes, Valley Center, Cal., are bottling rattlesnake oil. They recently captured 60 snakes in one den. Each snake nets them 75 cents.

—The Tacoma, Wash., Mill Co. has an order for 1000 M feet of fir lumber for shipment to Hamburg, Germany, and includes 200 M feet bips' decking.

—The San Francisco Harbor Commissioners will charge the California State Board of Trade \$115 per month for its new quarters in the Ferry building.

—The Mt. Whitney Electric Power Co. is diverting water from the Kaweah river, Tulare, Cal., to furnish power and light to Visalia, Tulare and Porterville.

—Yield of dry wines in California this year is estimated 8,000,000 gallons, as against 27,000,000 gallons last year. Sweet wines, it is figured, will show one-half the production of '97.

—The Northern Pacific will build a short line between Missoula, Mont., and Pasco, Wash., making a cutoff and saving over 100 miles of distance in the line between St. Paul and the coast.

—The report of the director of the Geological Survey upon the production of crude petroleum for the year 1897 shows that California yielded 1,993,411 barrels, an increase of 1.98 per cent over that of 1896.

—Total tonnage of beets delivered at the Chino, Cal., factory this season is 35,000 tons. The season closes November 15th with a probable total of 50,000 tons. The sugar content of the beets averages 14 per cent sugar.

—The Fulton Engineering and Shipbuilding Works has sued the Alaska-Yukon Transportation Company for \$12,233.13, balance due for labor and materials furnished in the building the steamers J. W. Scammel and James Eva.

—On the Mariposa, from Sydney, N. S. W., to San Francisco, on the 20th inst., came \$3,670,000 in gold, English sovereigns—a total of gold from Australia to San Francisco, since Aug. 6th, '97, of \$32,352,729. Talk about the Klondike!

—Pres. Horace G. Burt of the Union Pacific Railroad states positively that the Union Pacific will not absorb the Union Pacific, Denver & Gulf, nor any part of it. The Julesburg Line has already passed into the control of the Union Pacific.

—At Roslyn, Wash., the Northern Pacific Coal Co. in March, 1895, employed 409 men and paid them \$14,335.20, an average of \$35 per month to the man. During March, 1898, this company employed 679 men and paid them \$42,365.45, an average of \$63.10 to the man.

—The Carbonado, Wash., coal mines shipped 35,000 tons during September, beating all previous records. Roslyn had held the record with 30,000 tons. The Carbonado mines, owned by the Southern Pacific Railroad Co., are running full time and employ 600 men, averaging \$3.29 a day wages.

—During June, July, August and September, '98, there were shipped from Washington 8028 cars lumber. The increase in lumber shipments from Washington has been more pronounced this year than that of shingles. The first nine months of '98 show 133,424,000 feet, as against 92,464,000 feet in the corresponding months of '97.

—D. E. Brown, general agent Pacific Railway and Steamship Co. Hongkong, says the Oriental trade of the last five years should more than double in the next five years, owing to increased transportation facilities

and to the close relations that will have to exist hereafter between this country and the Orient, as the result of holding the Philippine islands.

—The British ship Alcides, which sailed from San Francisco for London on the 17th, carried 11,203 cases salmon, 64,441 cases canned fruit, 10,000 gallons wine, 425,534 lbs. beans, 33,013 cents barley, canned asparagus, sardines, beeswax and cascara bark, California products, valued in all at \$307,578.

—The Union Pacific now controls a majority of the Short Line stock, but the road will continue to be operated as an independent system. In 1884 the Union Pacific regarded the Oregon Short Line proper as a poorly paying investment. The net earnings then were only \$288,639.42. The earnings for the last few years have been above the million mark, which has caused a rise in the stock.

—The monthly report of the Oil Producers' trustees at Los Angeles, Cal., for September was issued last Saturday. It says 23,286.28 barrels of oil were sold during the month; 85,236.28 barrels are stored. The amount received per barrel at the wells was \$2.27 cents. Expenses, \$726.05; average cost of selling, 3-10 cent per barrel; net average received, 79.17 cents per barrel; cost of storing, \$118.72; net amount remaining for oil sold, \$17,356.48.

—The Atchison road has 6479 miles; the Northern Pacific system operates 4553 miles. The cost of operating the Atchison is 72% of the Northern Pacific 47%. The cost of carrying passengers on the two roads is practically the same, 0.23c per mile. The Atchison for the year ended June 30th, '98, spent \$1192 per mile for maintenance of road and structures and \$671 for maintenance of equipment. The Northern Pacific spent \$700 per mile for maintenance of road and structures and \$384 for equipment.

—One of the results of the survey of the mouth of the Yukon river this summer by Capt. Pratt of the Coast and Geodetic Survey is to add an area of 2500 square miles to Uncle Sam's domain. Capt. Pratt found that the south mouth of the Yukon emptied into Bering sea, twenty-five miles farther west than has been supposed. In addition to this, it was found that the whole coast line from Cape Dyer almost to St. Michael is farther west than is shown on the maps.

—Near San Diego, Cal., an enormous bed of vein of lepidolite (lithia mica), 60 feet or more in width where best exposed, contains rubellite (pink tourmaline) in large amounts. As a source of lithia and potash this deposit must soon take first rank commercially. It is now being worked as an open quarry, and 1,500,000 tons are estimated to be available. Much of the rubellite has been distributed to museums. Tourmalines of gem quality were first found during the present year, being all of the red variety. Black tourmalines are frequent, but green tourmalines occur only sparingly at that locality.

—There are in California six counties which sustain a local tax rate exceeding \$2—Mariposa, Mono, Plumas, Sierra, Trinity and Tuolumne. All are mining counties in which a large amount of money is expended annually in repairing and maintaining roads. There are in the State eighteen counties which sustain a general rate of over \$2—that is to say, a tax rate of over \$2 when the State rate is included. The highest rate is in Sierra—\$3. The lowest rate is in Fresno—county tax, 56 cents; total for State and county \$1.05. High tax rates in the mining counties have always been a feature of California government. The amount of assessable property in these counties is small and great difficulty is experienced by assessors in getting taxes. In some mining counties there are large quantities of Government land which cannot be assessed, and to procure money for the maintenance of government high values is placed upon property worth holding.

—Steamship men say there will be a change in the pattern of Yukon river steamboats built in the future, as the patterns heretofore have not been suited to that stream. The boats now in the trade from St. Michael to Dawson are represented as being too slow, wide and unwieldy. When recent traffic on the Yukon began, agents of men going into that business went East to get models of the craft best adapted to that use. They went to the Mississippi river, and it is supposed, decided that the stern-wheelers used there were the very type wanted, as there are none but stern-wheelers on the Yukon and most of them have all the objectionable features of the ancient towboats that plied between St. Paul and New Orleans thirty years ago, and are now used to tow lumber rafts. The development of the trade up the Alaskan stream has been so rapid that none but the best service will be satisfactory. There are now 112 steamboats plying inward from St. Michael, with a total tonnage of about 17,800 tons, of which 42 have 16,800, and the remaining 70 are average of but 15 tons each. The largest boat on the river is the steamer Sarah, the property of the Alaska Commercial Co., with a register of 720 tons.

—The White Pass & Yukon Railway Co., an English corporation, has organized to operate a railway from Skaguay to Fort Selkirk, Northwest Territory, a distance of 380 miles. The Pacific & Arctic Railway & Navigation Co., a U. S. corporation, is building the road from Skaguay to the international boundary line. From thence to the dividing line between British Columbia and the Northwest Territory the road will be built by a British Columbia corporation called the British Columbia Yukon Railway Co. From this point on the British Yukon M. T. & T. Co. will do the work. The construction work on the three systems will be carried out by the Pacific Contract Co. The survey work was commenced last April and track-laying began in Skaguay in June. The gauge of the track is 3 feet; weight of steel, 56 pounds per yard in T-rails, laid upon sawed ties, 6 by 8 inches by 6½ feet. Almost the entire section from

three miles beyond Skaguay is rock, with some heavy cuttings. There will be one 500-foot tunnel. The heaviest gradients will be 3.9 per cent, obtained without a switchback. The maximum curvature will be 16°. The road starts at the wharf in Skaguay. The first sixteen miles of the road are completed and the balance of four miles to the Summit is under construction.

Recently Declared Mining Dividends.

Republic mine, Washington, 3 cents per share, \$30,000; payable Nov. 10.

Empire State M. Co., Idaho, 10 cents per share, \$7500; Oct. 15.

Elkton Con. M. & M. Co., Colorado, 2 cents per share, \$25,000; Oct. 20.

Breece M. Co., Colorado, 5 cents per share; payable Dec. 11.

Montana Ore Purchasing Co., Montana, \$10,000; Oct. 20.

Boston & Montana, \$4 per share and \$1 extra per share, \$750,000; payable Nov. 21.

Homestake M. Co., South Dakota, 25 cents per share and 25 cents extra, \$62,500; payable Oct. 25.

Yellow Aster, California, dividend for September paid Oct. 15, \$20,000.

Alaska Treadwell G. M. Co., Alaska, 37½ cents per share, \$75,000; payable Oct. 28.

Alaska Mexican G. M. Co., Alaska, 10 cents per share, \$18,000; payable Oct. 28.

American Nettie mine, Colorado, 12 cents per share; Oct. 22.

Associated G. M. Co., Colorado, 1 cent per share, \$15,500; Oct. 10.

Gold Coin, Colorado, 1 cent per share, \$10,000; payable Oct. 25.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CONTINUOUS HOT AIR SPRING AND VAPORIZER.—M. L. Cooper, Modesto, Cal. No. 612,158. Dated Oct. 11, 1898. The object of this invention is to provide an apparatus which is especially useful in the production of heated air, either plain, medicated or charged with a vapor which it may be desired to employ in the treatment of the mouth, nose or ear, and to furnish a graduated supply thereof through a suitable non-conducting passage and tip or nozzle through which it may be applied. It consists of an open-bottomed casing having a socket fitted therein adapted to be supported from a burner, a heater in the upper part of the chamber above the burner, a discharge pipe connected with the heater having a flexible conducting pipe, a discharge nozzle, a handle-piece through which the flexible pipe passes, an air supply pipe and a chamber interposed between the supply pipe and discharge for the reception of any material with which it may be desired to charge the air.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING OCTOBER 11, 1898.

612,377.—FANCH PLOW—J. B. Brite, Tehachapi, Cal.

612,158.—HOT AIR SPRING—M. L. Cooper, Modesto, Cal.

612,311.—POPCORN MACHINE—F. E. Cubbison, Los Angeles, Cal.

612,317.—MIXING MACHINE—P. F. Dundon, S. F.

612,131.—BUDDING KNIFE—T. J. Henderson, Elena, Cal.

612,243.—SEPARATOR—R. W. Jessop, S. F.

612,256.—ROOF BRACKET—M. Mattson, Sellwood, Ogn.

612,362.—LEMON SQUEEZER—E. D. Middlekauff, S. F.

612,361.—ELEVATOR—J. H. Moon, Portland, Ogn.

612,173.—RETURN BALL—H. E. Newton, Los Angeles, Cal.

612,277.—CULTIVATOR—W. H. Sayer, Adams, Ogn.

612,142.—TREE PROP—L. D. Schaffer, Redlands, Cal.

612,369.—HOT AIR FURNACE—T. Walker, Oakland, Cal.

29,481.—DESIGN, TYPE—G. F. Schroeder, S. F.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Commercial Paragraphs.

THE Lacy Manufacturing Company of Los Angeles are about to erect a large oil tank for the Pacific Coast Oil Company at Ventura.

THE American Stoker Co., Denver, Colo. have equipped the Silver Lake mine at Silver ton, Colo., with their stokers.

A VAN WRE centrifugal pump, driven by a Foss engine, is raising 80 inches of water 35 feet on the L. R. and Lee R. Mathews place, Pomona, Cal. Both pump and engine were furnished by the S. W. Luitweiler Co. of Los Angeles.

Recent Mining Incorporations.

The Mother Lode M. & E. Co., San Francisco; capital stock \$50,000, subscribed \$24,000; P. R. Klein, G. F. Weeks, J. C. Rice, W. A. Cross, G. L. Smith.

Phoenix Lake G. M. Co., San Francisco; capital stock \$100,000, subscribed \$25; G. R. Gibson, F. H. Gibson, R. W. Carter, T. E. Jewell, S. Gardner.

New Books.

"Handbook of Engineering Laboratory Practice," R. A. Smart; 12 mo.; pp. 290; intended primarily as a manual for the use of students in experimental work in hydraulics, steam engineering, etc., conveniently arranged. Jno. Wiley & Sons, New York City; \$2.50.

Personal.

CHAS. BUTTERS is visiting the Comstock. M. TURNER becomes Supt. Rawhide mine, Sonora, Cal.

M. SMITH succeeds W. Moorhead as Supt. App mine, Sonora, Cal.

B. F. THORNTON becomes Supt. Gray Eagle Con. Mines, Yreka, Cal.

W. F. DETERT, Supt. Zeila mine, Jackson, Cal., is in San Francisco.

C. M. ROOT becomes Supt. Gentle Zephyr G. M. Co., Volcanville, Cal.

T. T. LANE, a mine operator of Chihuahua, Mexico, is at Ely, Nevada.

I. G. SHEPHERD is installing hydraulic machinery at Quesnelle Forks, B. C.

P. KERVIN has been appointed Supt. Con. Cal. & Va. M. Co., Virginia City, Nev.

W. MOOREHEAD succeeds C. P. Grimwood as Supt. Dreisam mine, Soulsbyville, Cal.

ROSS E. BROWN left on the 18th for a sixty days' business visit to London, England.

J. EDY, Supt. Pine Hill G. & S. M. Co., has returned to the mine from San Francisco.

D. W. FRANK DRAKE, Sonora, is the Tuolumne Co., Cal., agent for this publication.

W. C. PAIRAN, owner Sophia mine, Gold Hill, Oregon, has returned from Portland.

H. A. COHEN of Mercur, Utah, is examining mining properties at Buffalo Hump, Idaho.

W. K. ROGERS of the Oregon Bonanza mine, Grant's Pass, Oregon, is in San Francisco.

T. JAMES, Supt. Shorty Hope mine, Grant's Pass, Oregon, has returned from Portland.

E. W. MENDANHALL, Gen. Mgr. Selby mine, Diamond Springs, Cal., is in San Francisco.

C. D. LANE, San Francisco, is visiting his Fortuna mining properties near Yuma, Ariz.

C. A. BROCKINGTON, part owner Orleans mine, Grass Valley, Cal., is in San Francisco.

C. A. HAMILTON, San Francisco, is examining mining properties in Calaveras county, Cal.

M. L. RODGERS, Supt. Mt. Gaines mine, Hornitos, Cal., is taking a two weeks' vacation.

C. N. STEWART of the Scottish Mining Trust of London, England, is in San Francisco.

A. MORGAN, Supt. Baltic mine, Sly Park, Cal., has returned from San Francisco to the mine.

J. FARREN, Supt. Glasgow & Western M. Co., Golconda, Nevada, is in Salt Lake City, Utah.

THOS. COUCH of Butte, Mont., is examining the Gold King quartz mine near Grant's Pass, Oregon.

W. H. MCCLINTOCK, Supt. Philadelphia mine, Sonora, Cal., has returned from San Francisco.

A. L. BEGIE, Supt. Mt. Pleasant mine, Grizzly Flats, Cal., has returned from San Francisco.

J. DERN, Mgr. Mercur mine, Mercur, Utah, is examining mining properties at Cripple Creek, Colo.

W. H. RADFORD, Supt. La Grange hydraulic mine, Weaverville, Cal., has returned from San Francisco.

J. H. KINKAD has resigned as Supt. Occidental Con. mine, Virginia, Nev. He is succeeded by A. T. Eager.

L. McDONALD, Gang Gulch, Cal., part owner Bloss & McClary mine, Trinity Center, Cal., is in San Francisco.

F. PANTER, owner Evening Star mine, Whitehouse, Cal., has returned from several months' sojourn in Germany.

J. B. WHEELER of New York City is visiting the Plumbago mine, of which he is principal owner, at Alleghany, Cal.

F. T. SUTHERLAND, interested in the dredger near Biggs, Cal., is examining mining properties near Leland, Oregon.

P. HOLLAND, Trinity Center, Cal., owner and operator of an extensive gravel property near Abrams, is in San Francisco.

THEO. E. SCHWAB, mining engineer of Denver, Colo., has returned from a professional visit to the Salmon river country, Idaho.

W. I. SMART of New York, who spent several months examining mining properties near Sierra City, Cal., is in San Francisco.

D. M. KENT, San Francisco, secretary Mayflower G. M. Co., Forest Hill, Cal., is at the mine making an examination of the property.

J. J. OTT, the pioneer assayer and mining man of Nevada City, Cal., is taking a six weeks' vacation in San Luis Obispo county, Cal.

THOMAS S. NOWELL of Alaska says that that district should have a representative in Congress and the protection of adequate land laws.

A. WARTENWEILER has returned to San Francisco from Copper Camp, Cal., where he has been examining copper mines for the Rothschilds.

D. McVICHIE, Supt. Golden Gate mine, Mercur, Utah, has been appointed Asst. Gen. Mgr. of the property. He is succeeded as Supt. by F. H. Pelliar.

J. H. NEFF of Colfax has been re-elected president Morning Star M. Co. On the 8th prox. he will be elected to an even more responsible position.

H. C. CALLAGHAN, who used to be Supt. Eagle Bird mine, Nevada Co., Cal., but who has for some years been in charge of Australian properties, returns on the next steamer.

L. R. POUNDSTONE, Supt. Oro Fino mine, Shingle Springs, Cal., is in San Francisco. He reports that work in the mine will be resumed and the 30-stamp mill started so soon as water can be had.

The Future of the Earth.*

According to the ideas of astronomers, the earth was detached from the solar nebula, and, after being a "miniature sun," was condensed by cooling. Losing its heat by radiation in space, the fiery globe became covered with a solid, dark crust. The solid layer then acted as a barrier to the radiation of the molten mass beneath, for rock has a feeble conductive power. The sun, then, is the sole source of heat that has supported, and that yet supports, the terrestrial surface. On the formation of the solid crust, the water vapor diffused throughout the atmosphere condensed little by little, and water accumulated in the first depressions of the surface. Thus were formed the first oceans, in which life was soon to manifest itself in the most rudimentary organized forms. While these forms went on to develop into more perfect types, distributed uniformly over the globe, the cooling of the earth continued; foldings resulting from its contraction appeared on the surface, and its internal activity showed itself, at intervals, in various regions in the form of volcanic eruptions. The earth's profile thus became more accentuated by the elevation of mountains and the lowering of the first oceanic depressions. It is probable that vegetation then appeared on the first continents, whose temperature must have been tropical. But the outline of the surface did not depend solely on the contraction of the earth's crust, but also on erosion, due to atmospheric agencies. While the contraction, by lateral folding or vertical depression of layers, raised or lowered considerable portions of our planet, erosion produced an inverse effect, since by the action of rain, ice, and variation of temperature it disintegrated the rocks and reduced them to powder, which it transported and heaped up in the depressions of the crust. Consequently contraction accentuates, or at least preserves, in one form or another, the relief of the surface, which denudation is working to obliterate. The resultant of these two opposite agencies gives us the form of the globe at any given moment.

In the course of geologic time contraction formed mountain chains. The first mountains, which were as high as those of to-day, have in great part disappeared by erosion; there remain only fragments, which the study of geology alone enables us to identify. As cooling continued, climates became differentiated, and to the lower plants and the invertebrate animals succeeded higher forms: fishes, reptiles, birds, mammals, and finally man. The human species had not yet appeared on the earth when the Pyrenees, the Alps, the Carpathians, and the Himalayas were formed. These are a part of the same mountain chain, whose relief is in great degree preserved, because it is the most recent chain and the action of time has altered it least. As long as contraction shall continue there will be mountain chains, a very accentuated relief, continental masses, and consequently an easy flowing of waters to the sea. But when by cooling the crust shall become sufficiently thick and solid to prevent lateral folding, mountains will no longer be formed, and then, as denudation alone will act, it will level the surface little by little. Then, by the partial filling of the oceanic basins, by the greater and greater difficulty of flow (due to lack of slope) of water toward the sea, the continental masses will be divided, by channels of greater or less size, into true archipelagoes. At this time there will be on the earth no more water surface than at present, but this water will be differently distributed. Nothing shows that at this period, far in the future, life will be impossible on the earth. Nevertheless, although the essential elements of air and water will not be lacking, cold will certainly bring about a change in the character of life, and a partial disappearance of living creatures from its surface.

M. Dollo asks whether some other planet may not have already reached the stage that we have just predicted

for our globe? There is one, in fact, the planet Mars, of our own solar system. After the earth shall have reached the phase represented to-day by Mars, what will become of it? Instead of consisting of a crust and a fluid nucleus, it will be completely solid. It will then absorb into its crevices the whole of its air and its water. This will easily occur, for experience shows that for this it will be sufficient to be only one-third as porous and only one-hundredth as full of fissures as the granites that are now traversed by millions of veins of harder rock. These fissures, which can no longer be filled with molten rock from the depths of the earth, will be occupied by water. If life has not already ceased by this time, it will then be no longer possible. And after this? Afterward, the fissures will increase as the mass contracts further, and the earth, cracked, dislocated, and finally broken into pieces, will rush through space as a shower of meteorites. The fissures observed on the moon's surface and the meteorites that fall on our globe enable us to believe in such a future state for the earth. Such, briefly summed up, are the series of phases through which our globe has passed and probably will pass.

Jeffrey Columbian Separator, Screen and Bolter.

Herewith is illustrated the Jeffrey Improved Columbian separator, which has made a record in the cement industry, and has also gained favor in kindred industries. It is substantially

JEFFREY COLUMBIAN SEPARATOR, SCREEN AND BOLTER.

built of hardwood. The screen frame is connected to eccentric rods and is confined at its corners by special nut and screw device, the vibrations thus keeping it in a live state. The screen frame is adjustable, so that it can be set at various degrees of inclination, to suit the material handled.

The manufacturers furnish several endorsements from substantial concerns who have used it.

E. S. Godfrey, C. E., has used the Columbian and states he has "screened ground whinn rock (quartzite) to 100 mesh, and at the rate of three or four tons per hour—in fact, more than it is possible for any pulverizer to grind. Have also screened phosphate (pebble) to 60 mesh at the rate of five or six tons per hour." And this he considers below the capacity of the screen, although all the mill would grind. This machinery is now made by the Jeffrey Manufacturing Co. of Columbus, Ohio.

In investigating pitchblende to find why the activity of the Becquerel rays is not proportionate to the amount of uranium present, a rule holding in general for compounds of uranium, M. P. Curie has isolated a new substance which appears to be a new metal. It is, according to the *Comptes Rendus*, thrown down with the bismuth sulfid and partly separated by heating in vacuum to 700° C., the sublimate obtained having 400 times the activity of uranium. The spectrum, however,

emits no characteristic lines. The name of polonium is suggested for the new substance, from the country where the pitchblende was found.

Is Darwinism True?

W. S. PROSSER.

NUMBER IX.—CONCLUDED.

Notwithstanding this, it is the essence of Darwinism that all new parts grew gradually through many generations. Hence "survival of the fittest" could have had nothing to do with such new devices, because they could not have come into action until perfected—could have been of no advantage in the struggle for existence while they were not, while yet growing and rudimental.

Packard says "this rapid multiplication of different types went on without those checks which operated in later times. There was a comparative absence of competition and selection." That is strange. Evolution of new forms is taught by Darwin to be the result of competition and selection; yet here we are told that the multiplication of new forms is most rapid in the comparative absence of these. Truly this Darwinism is a queer thing.

The survival of the fittest is imaginary; species survive at their average. In wild nature there is little or no struggle for existence between those of a kind; food is usually to spare, and the numbers of any species are limited by outside enemies, and the average escape these enemies as well as the best. In plants the survival is governed by locality and chance princi-

fatherly wisdom? The attention of evolutionists is kindly invited.

As some bacteria can live in boiling water, it is possible that they were the real first of living creatures.

Starting from the fact (first noted by Adam) that no two individuals are alike, Darwin assumed that these differences were of all degrees, and tended to increase, and he argued that therefore one species could easily slide into another, and that into something else, till a gnat could change into a racehorse if only given time enough. That is to say, an impossibility is quite easy if time enough be allowed and the process be away off out of sight. Darwin's experiments on domestic pigeons and dogs remind me of a boy whittling a stick. He does not know what he is trying to make, but hopes he may blunder onto something grand. But please note that evolution in nature would be properly represented by the knife and the stick securely locked up. That a dead rock, or a living worm, could invent and construct a telescope or an eye, a piano or an ear, a wing or a steam engine, is unthinkable, whether in a day or a thousand years. As well say 3×3 might equal 11 if it had time enough.

The chances for the human race to grow two stomachs and a pair of wings are billions and billions greater than for the "primordial germ," or even an oyster, to have invented the eye, or leg, or wing. The homo, with all his knowledge, all foods and conditions at command, cannot evolve a new tooth, or a single hair in a bald head.

Of course, I highly honor Darwin, Wallace and other earnest and gifted workers in science. They worked for truth, and the highest tribute to them is to believe that they would be the first to discard their theories if shown to be erroneous.

As the sum of the whole matter, I do not hesitate to affirm that evolution by means wholly natural is impossible; that natural selection, or survival of the fittest, as an evolutionary force of importance is imaginary; that Darwinism, or Lamarckism, as an attempt to explain anything is a failure; that in the forms of organic life there is, in past or present time, a series, practically complete, consistent, and adapted to its environment; that the genesis of each of the series must have been the direct act of an outside and very intelligent power, yet such genesis might have been, probably was, usually, under the veil of the flesh, might occur to-day before our eyes in any new birth; that hence, for common working purposes, no great harm

may be done if we speak of the process as natural; that to this one large exception should be made, and that the homo is not, even to this extent, lineally descended from the animals; that, by parity of reasoning, all human races may have descended lineally from one, but yet, by the originating power, were differentiated into several radically unlike kinds; and that for working purposes the present theory is necessarily superior to Darwinism as more flexible, and as involving less waste of time in absurd explanations. Finally, I invite any candid mind to fix the two theories clearly in mind and then to read descriptions of the serial forms of any genus of animals, and decide which is the more reasonable.

M. HEISE, after calculating the temperature of explosion and the efficiency of various safety explosives, finds that the temperature of explosion has no direct bearing on the safety of explosives. His results were as follows:

| Explosive. | Temperature of Explosion, Degrees C. | Force of one Kilogramme of Explosive, Kilogrammes. |
|------------------------|--------------------------------------|--|
| Carbon dynamite..... | 1821 | 332,000 |
| Dahmentite..... | 2064 | 341,000 |
| Roburite..... | 1816 | 230,000 |
| Westphalite..... | 1806 | 274,000 |
| Gelatine dynamite..... | 2394 | 491,000 |
| Dynamite..... | 2207 | 427,000 |

THE specific gravity of the earth has been found by Dr. C. Braun to be 5.52765—the earth weighing 5½ times that of a globe of water the same size.

* Condensed—Public Opinion.

Mining Summary.

ALASKA.

A. Wing of the Seattle assay office says the office has received \$4,300,000 from the Klondike and that he has a letter from the San Francisco office in which the statement is made that \$3,600,000 has been received there. Farnsworth, from Kotzebue sound, where he went last April on the schooner Marlon in San Francisco, says her voyage north in fifty-seven men aboard was something terrible. For days they were cooped up in bath hatches, with only canned meats to eat, the seas washed over the Marlon's deck. Farnsworth's party became disgusted with the prospecting late in August and returned to Kotzebue, where they found 800 hungry and the most penniless prospectors living in tents stretched along the beach for half a mile. Farnsworth says not one in ten had money to pay his return passage and not one had supplies for the winter. Neither food nor work was obtainable. Among them were several dozen women and children who were suffering for food. One family had been living on rice and pickled pork for ten days. The tents men were suffering from typhoid pneumonia, without any attendance but mustard plasters administered by their mates.

Rant, the government official in charge of the Lake Atlin district, says that the town has been taken away from T. J. Watson by the Government, by the declaration that the country for five miles around Atlin is a government reserve and no one can buy or sell land there. Lots will be leased on the reservation, it is said, for \$250 per month, and money thus secured used for municipal purposes in the townsite. A trail is being cut from Skaguay to the new gold fields, 92 miles distant, while they are 173 by Bennett and the steamers. A fair idea of the distance from Skaguay to Lake Atlin by way of the trail may be had from the following distances of the different places: Skaguay to Brooks' Camp, 25 miles; Brooks' Camp to river of no name, 15 miles; down river of no name, 8 miles; river of no name to Taku Arm, 10 miles; Taku Arm to Golden Gate, 5 miles; continuation of Arm to Portage, 14 miles; from Lake Atlin, 8 miles; Lake Atlin to recovery on Pine, 8 miles; total 92 miles. The entire distance from Skaguay to Taku is almost due east. At Golden Gate the trail turns to the right and then leads to recovery, a distance of 31 miles.

Recent Dawson arrivals say: "The benches will be the making of Klondike. The recent discoveries in that line of claims were the Dominion benches. Gold was found in wonderful quantities almost along the whole creek. Wages are much lower than last year. I think \$8 will be the prevailing scale this winter. It may go as low as \$7. On one day forty men were at work for 65 cents per day, instead of \$1.50, as last year. The big ones, as a rule, will not be worked this winter. One reason for this is that all the mine owners are on the outside enjoying the fruits of their labors. Hundreds of small ones will be opened up and many new creeks will be added to the list of producers. This winter's development on the new claims will determine the extent of Klondike's richness." The steamer Roanoke has arrived from Michael; thence October 8. When she left there were only three steamers there, the Highland, Protection and Garonne, which were all in a day or so for San Francisco, Seattle and Victoria respectively. They had only a few passengers. All of the Yukon river steamers had gone into winter quarters. The Roanoke brought down about 350 passengers and gold dust estimated at \$1,500,000.

B. Tyrrell, who was commissioned by the British Government to report on the geological formation of the Klondike has returned to Ottawa. He started in May last over the Dalton trail. Prof. Tyrrell gave the following sketch of his trip: After working over the Dalton trail to the Klondike, I visited every mining camp of importance. I think the country has vast riches, which will take some time to develop. With the exception of one or two creeks they have simply scraped the surface of that district so far. I believe it is purely a placer mining region, but I also believe that it will prove permanent. Next year I have no doubt the gold output will be double of this year's. It has cost an enormous sum to develop the mines even on rich creeks like El Dorado and Bonanza. Fortunes were made in this work. Miners were getting \$15 a day and the lumber and wood necessary to carry on mining operations cost the miners small fortunes. Now everything is different. There are plenty of men in the country to do the development work on the mines, and, with cheaper living, wages are down to a figure at which owners can go right to work with the work of seeing what the mines are worth. When I left Dawson there was a movement on foot to pay miners \$100 a month aboard them. Some of the principal mine owners were in favor of this. Only two creeks have been worked to any extent, El Dorado and Bonanza. Creeks like Hunter and Dalton and their tributaries have not been worked fully, although they are known to be rich.

ARIZONA.

The Vekol mine in Pinal county is shipping twenty cars of concentrates.—At the Harbinger mine work on the 40-stamp mill has begun. The World's Fair mine in Pima county is a lead and silver producer, and the shipping receipts show close to 1000 ounces per ton. In the Dragons the Middlemarch Copper Co. is opening up properties and from a ton jacket turned out considerable bullion. Cuprite Camp near Bisbee has fourteen claims. A shaft is down 115 feet and drifting has been done 100 feet from the 100-foot level. C. Fenner is Supt. Republican: The Cherry Creek G. M. Co.

of Yavapai county is reducing the ores of the Etta mine with a 10-stamp mill. The large vein produces ore ranging from \$15 to \$40 per ton.

The Mojave County Miner hears that the Cedar Valley M. Co. will soon begin work on their Cedar Valley property on a large scale.—At the Pay Roll, Juno, Silver King, Minnesota and Schuykill mines in Mojave county steam hoists are to be erected.

Yuma Sun: The Planet-Saturn mine at a depth of 800 feet has cut a vein of ore which is said to be high grade.—The Marshall copper mine has been purchased by the Live Oak Copper M. & M. Co., which is controlled by capitalists of New York.

Journal-Miner: M. S. Taft is developing the Sterling and Binghamton mines in Big Bug district. He has five carloads of ore on the dump for shipment as soon as the railroad to that country opens. He has a shaft 135 feet deep and 200 feet of levels, most of the openings being in ore, which is copper running 35 per cent, containing gold and silver.—E. F. Gage and others bought the McNary property in Copper basin. The claims are opened up and show a fine body of ore.

Belt: Supt. Amster has increased the force at the Continental mine near Globe to push development. A diamond drill will soon be used to prospect the property to the depth of 1000 feet.

Phoenix Republican: Two cars of heavy machinery have arrived at the Spenszuma mines and five cars more are en route. They are working forty men in developing and improvement work, and expect to double the force. They are putting in a combination smelter and milling plant that is expected to handle 500 tons of ore per day.—The development of the new gold finds in the Canyon del Oro near Tucson continues to hold out with depth. In one of the Purcell group the vein is over 3 feet wide of solid ore.

Florence Enterprise: At the Jack Rabbit mine in Pinal county a 10-stamp mill is being built.

Mojave County Miner: From the Colorado river near the old Senator mill come reports of the finding of big gold deposits. Over 2400 acres of gravel have so far been located. The most extensive deposits are twelve miles back from the river, but all the ground can be worked by hydraulic process. W. Walker brought two ounces of coarse gold taken out while prospecting with a drywasher. The men on the ground with drywashers say they can make good wages in the small gulches. The best ground is too far from water to be worked properly by machine. The whole north end of the Cerbat range, where the river cuts its way through, is said to be gold bearing. Only the coarse gold can be saved in the machines, the fine going over the tailboard. So far as prospected, the ground will yield from one-half to one cent to the pan. The great body of gravel is low grade. Men have already looked the ground over with a view to putting in a big plant on the river.

Yuma Sun: The McNary mine, in Copper basin, Yavapai county, has been sold to E. B. Gage and others, and a large force will be employed to push development on the property.—At a depth of 200 feet, 5000 pounds of ore from the Good Hope mine, Yavapai county, runs 6.6 ounces in gold and 3.7 per cent copper; dry: the net return being \$105.87 per ton.—A carload of high grade ore is taken out monthly from the World's Fair mines, in the Harshaw district. On Sept. 27, twenty tons were shipped, which returned over 1000 ounces of silver, \$6 in gold and 23 per cent lead. A 10-stamp mill and three concentrators handle all of the fine grade ore not shipped. Development has reached 400 feet depth, and the veins are from 1 to 20 feet in width.

CALIFORNIA.

Amador.

Ledger: Joyce & Watkins are opening a mine near Jackson. They have a 4-stamp mill, which is being operated at a profit by steam power.—Near Drytown the Centennial mine has been unwatered by a company represented by L. A. Gross. The intention is to sink the shaft an additional 200 feet and thoroughly prospect it. The shaft is down about 300 feet.—The Loyal Lead for many years has been many times bonded, but no results have been obtained. Now an agent is buying up the shares, with hope of reopening the property, in connection with the North Gover.—The Gover mill was burned last week, together with the retort house. The fire was supposed to be of incendiary origin. This is the third mill burned in that neighborhood in a short time—the Bunker Hill of forty stamps, the Cosmopolitan of thirty stamps and now the Gover of twenty stamps. All of these were idle when destroyed.

Dispatch: In the north shaft at the Kennedy mine about 350 feet needed retimbering and the work is about half done. During the progress of this work all the ore taken out of the mine is hoisted through the south shaft. It will be about six weeks before the work is completed. The engine and boiler for the mill are in place, and will be ready to run next week. The mill is dropping forty stamps, and the ore yields the usual average.—In the Iron Bound mine, near Volcanville, unwatering the shaft is progressing.

Record: The Balioi G. M. Co., Sutter Creek, elected C. F. Bishop Pres., R. L. Cheney Sec., S. R. Porter Supt. The mill will start up in a short time.—Two hundred tons of ore are being hauled from the Lincoln mine, Sutter Creek, to the Zeile mill for crushing. It will probably pay between \$30 and \$40 per ton. Mgr. Voorheis expects to have a 40-stamp mill on the Lincoln by next spring.

Butte.

The Oroville, Cal., Water Co. has forty men enlarging the Miocene ditch and laying a pipe line under a 300-foot pressure to supply the town with power for electricity. The ditch will carry 2500 inches of water.

Register: The Mt. Ida quartz mine, near Oroville, milled 100 tons of ore that yielded

\$600. The ledge is 6 feet in width. The tunnel taps it at 300 feet.—At the Carlisle mine, near Enterprise, work will soon be resumed.—The New York M. Co. has sixteen men building a ditch near Brownsville.

Marysville Appeal: The lease to H. P. Stow, Supt. Gold Bank and Golden Queen mines, near Forbestown, has expired on the latter property, though it is presumed that it will be renewed.

Calaveras.

(Special Correspondence)—E. K. Stevenot, M. E., is running a tunnel into Chaparral Hill, near Angels camp, to tap the chimney of gold ore discovered in a shaft sunk on the Rothschild, Vanderbilt and Chaparral Hill group of quartz mines, on the mother lode; the tunnel is in 20 feet, and indications favor a strike soon.—A strike was made this week in the Big Bonanza mine between Chaparral Hill and Angels camp.—At the Melones Con. group of quartz mines the development work is being pushed ahead with great activity and fine results are obtained. The repairing and enlarging the canal and flumes of the Union water ditch, which brings the water into Angels camp and vicinity, has been finished and the mines of that locality will be supplied with plenty of water shortly.

Angels, Oct. 15th, '98.

In the Ford mine at San Andreas at the 700-foot level two ledges have been crosscut and drifted upon, showing a large body of low-grade ore, with a rich streak of quartz which will bring the value to a reasonable figure. The company has decided to erect a 10-stamp mill and operate it on ore from the upper levels, and make tests in other places in the mine to demonstrate the advisability of erecting a mill of greater capacity.

The action of the Carson Creek M. Co. directors in voting J. H. Dickinson \$37,000 for services in selling the property to W. H. H. Hart for \$115,000 is sought in the Superior Court to be set aside by W. H. Porter, who alleges "fraud and conspiracy," as the purchase of the mine involved no payment of money by Hart.

Citizen: Lloyd & Allen, at the Shot Gun mine near San Andreas, are sinking a new shaft.—Work has been resumed at the Macomber mine at Jenny Lind.—Mitchler & Co. have begun operations near Murphys on their mines, the Ozark, McGowan and Dena.—The Gwin mine at Mokelumne Hill is working full time.

Prospect: The Ford M. Co., San Andreas, will build a 10-stamp quartz mill, to be completed the first of January.—At the Paragon a 4-foot vein of ore was found last week in the upper tunnel.—F. Grove has bonded his Black Wonder mine to San Francisco people, who will develop the property.—The Lightner mine, which was flooded recently by a break from the old works, has been unwatered and the company will resume operations as soon as water for power can be had.

Chronicle: At the Machu mine, in the West Point district, the shaft is down 130 feet. The lead at the depth of 70 feet and also at 130 feet averages from 2 to 12 feet in width. The ore ranges from \$7 to \$9 per ton. Ten stamps are in operation. Wm. De Witt has a bond on the mine, and under his supervision operations are conducted.—The Defender mine at West Point has a shaft down 70 feet on an 18-inch ledge on high grade rock. They have a 4-stamp mill and propose to increase their facilities.

El Dorado.

(Special Correspondence).—On that part of the mother lode between the Cosumnes river and Weaver creek, a distance of ten miles, there is much activity in mining. The shaft of the Crown Point is being sunk at the rate of 25 feet per week. The East Mother Lode mine is being worked from the tunnel, and I understand they have flattering prospects for a mine. The ledge is from 12 to 15 feet wide.

At the Griffith Con., in Diamond district, they have completed a 20-stamp mill, to be operated by electricity. The power is obtained from the Cosumnes river, 4½ miles distant, under a pressure of 1000-foot head. They have 7000 tons of high grade ore on the dump ready to be milled, and it is claimed they have a large amount of ore practically in sight.

At the Larkin mine, Diamond Springs, they have cut the ledge on the 400-foot level, which is said to be as good as the vein on the 300-foot level, which is 7 feet wide. The management claim it will mill \$40 per ton.

The Margurite, which joins the Larkin on the north, was sold to Eastern people during last week, who have incorporated under the name of Margurite. They are now in San Francisco purchasing machinery, preparatory to sinking a shaft on the property 1000 feet deep.

The Ribbon Rock claim, in the same neighborhood, has been bonded to Salt Lake people, and development upon the same was commenced last week.

At the Gold Note mine, twenty-six miles east of Placerville, they are working about seventy-five men, and things are looking prosperous in that vicinity.

At the Barnes mine, Shingle Springs, they have the water out and shaft retimbered to the 250-foot level.

Near El Dorado, Richards & Clark are erecting a mill on what is known as the old Field claim. They have a large dump of high-grade ore, and the mill will be started on the same the coming week.

At the Landecker gravel mine, near Placerville, Thos. Clark has struck it rich; he is taking out gravel going as high as \$20 per ton.

At Poverty Point J. Melton is building a 15-stamp mill, which is expected to run about Nov. 1st.

At the Gold Bug mine, situated in the town of Placerville, high grade ore is being taken out ready for the mill, besides occasionally some very rich ore is brought to the surface. Placerville, Oct. 17th, '98.

The mill at the Eagle King mine, Grizzly Flats, idle for some time on account of water scarcity, has resumed work.—The U. S.

J. B. Selby to hydraulic near Diamond Springs.

Georgetown Gazette: Stone & Leahy of San Francisco are opening up a mine at Volcanville under a bond. The company will be known as the Gentle Zephyr G. M. Co.

Inyo.

The Meneva M. & M. Co., made up of Pittsburg, Pa., business men, incorporated under the laws of New Jersey, will operate in mines in the Pahump and Teopas neighborhoods. C. C. McCarthy is Pres. and W. W. Hammond is Sec. and Treas. It is said that \$1,000,000 is to be invested in developing the properties in Inyo county, Cal., and Lincoln county, Nev.

The Halbert interest in a group of mines in Pleasant canyon, Panamint mountains, has been sold to M. Godmark for \$7735 cash.

Kern.

Los Angeles Review: The Black Hawk mine in the Stringer district has large bodies of low grade ore, as well as considerable high grade.—The Baltic mine has been leased to miners, who are taking out ores and shipping to Koehn's mill.—The Gold Coin mine is worked by the owners, Mann & Co., who are taking out ore. They have a ledge of 2 to 24 inches. They are upraising from the 180-foot level.—The Merced mine is rapidly gaining depth. They are taking out ore running \$200 a ton.—The Winnie mine has a number of tributaries working. Most of them are making good wages. The ores are rich, but the veins small.—The Buckboard mine has a large body of low grade ore, with some high grade. They are down about 180 feet.—The Keyton, near Randsburg, has struck sulphurets at the 330-foot level, but they have not yet ascertained what values the new strike carries.—The Little Butte mine has reached a depth of 530 feet and shows a large body of sulphurets ore. The extent of the ore has not been determined, nor has the value which can be saved, nor the best mode of treating them. The ore bodies here in many instances are spotted, and to an uninitiated person the ore-bearing sand is almost identical with the ledge matter.

Mono.

Bodie Index: The Standard Con.'s accounts for September show receipts of \$34,800 and disbursements of \$21,500, leaving a balance of \$13,300 to be added to the surplus of \$32,742, making a total of \$96,042 on-hand. A former Debris Commission has granted a permit to foreman of the mine said it was but a jumble of old timbers in worked-out ground, but the mine continues its profitable output.—The Dunderberg property will be sold at sheriff's sales on the 24th. Legal entanglements have tied up the property, but it is locally stated that after the sale operations will be resumed.

Napa.

Calistogian: The Napa, Etna and Great Western mines near Calistoga shipped 830 flasks of quicksilver in September, seventy-two flasks less than were shipped in August.

Nevada.

Wm. Campbell tells the Grass Valley Union that he has just had completed a crushing from the Norambagua mine of Forest Springs, which paid \$75 a load and that "there is plenty more of the same kind in sight."

Union: Near Grass Valley the Holbrook mine struck gravel that proves of good quality and quantity.

Transcript: At the Eagle Bird mine, Maybert, as soon as winter sets in, a large force will be put on.

Herald: The Superior Court has ordered a receiver appointed and a survey made in the case of Andrew & Ellison vs. G. Fletcher and the Reddik M. Co. at Nevada City. The plaintiffs owned the Reddik claim and bonded it to Fletcher, who bonded it to the Reddik Co. Plaintiffs claim failure to keep contract on part of defendants and demand the return of the property.

Transcript: The new bedrock tunnel at the Malakoff mine, North Bloomfield, is in 600 feet, leaving 200 feet to be run to tap the channel. It is expected the work will be completed in six weeks. The ground has changed to a soft quality, and the Burleigh drill has been temporarily dispensed with.

Placer.

Colfax Sentinel: The extensive river mining operations at Cash Rock mine, near Forest Hill, have come to a sudden close this season. During the rainstorm Oct. 2nd a cloudburst precipitated a volume of water on an area of about 200 yards up Dardanelles canyon. This, added to the flow of the river, carried away a large portion of the flume of the Cash Rock Co., and owing to the lateness of the season, operations have been discontinued until next spring. Before the cloudburst fifty men were employed. A log dam 160 feet in length held the water in the river, which was conveyed by a large flume 600 feet.

Plumas.

Plumas Independent: Near Buck's Ranch a San Francisco company is building a quartz mill on the Kellogg claim.—W. De Long, who for some time past has been preparing for heavy mining operations on the North Fork, near the line of Mineral Tp., has done a large amount of work, and at heavy expense for labor, machinery and other material. His company is composed of business men of San Francisco, who are determined to conduct matters to a finish. They have a dam completed that will stand the highest waters of the North Fork. They have the river bed dry, and are getting out rich gravel.

Riverside.

Crawford & Bowles, at the San Diego mine, in the Chuckawallas, have begun further development.—Supt. Clark of the Chuckawalla M. Co. says these properties will resume as soon as reduction works to treat the ore are in place.

San Diego.

Work has been suspended temporarily at Deer Park because of the dry season. The

mills are obliged to shut down, though the miners continue to take out ore.

San Diego Union: The Escondido G. M. Co. has sued out an injunction against the Duquesne G. & S. M. & Co. of Colorado. The complaint asks for a temporary injunction to prevent them from disposing of certain property, the appointment of a receiver, and the return of a deed in escrow.

The **San Diego Union** says that the Helvetia mine at Julian has been sold to a Denver Co. and arrangements made to drain the lower levels of the mine and outfit for a test of its ores. If it proves satisfactory they will buy the property and begin extensive improvements. It has lain idle for seven years and was filled with water. The output of bullion from the Golden Cross mines at Hedges for September is reported at \$48,000. Receiver Pauly says this will enable him to reduce the company's indebtedness \$23,000.

San Bernardino.

Shipment of ore from the mines of the Peacock Co., near Latic, has begun.

Shasta.

Democrat: The 10-stamp mill at the Spanish mine, Lower Springs district, is running night and day. Fifteen men are employed at the mine. Capt. Taylor and F. Deakin of San Francisco are owners. The Princess Hydraulic M. Co. have settled litigation with J. K. Williams over a water right which will give the company water to work their mine.

—Reliable authority says that the Bully Choo group of mines in the western part of the county is about to pass to a Scotch company.

Free Press: With the first rain, insuring sufficient water for the purpose, E. P. Conner will start his quartz mill on Salt creek. Considerable good ore is on the dump. At Keswick the smelter plant is being worked to its fullest capacity. The three large blast furnaces are turning out matte. Besides these, there are a number of other furnaces consuming ore. The company is building another large smelter. There have arrived in San Francisco three ships filled with coal and coke for the Mountain Copper Co. and the railroad company is running special trains to the smelter. In the company's railroad yard last week were 100 box cars loaded with coke. All over the smelter yard matte is awaiting shipment. A writ of attachment was filed on the 10th of October by J. H. Wolkotte against the entire property of the Euclid Mining Co., better known as the Gladstone Mining Co., near French Gulch. The amount of the attachment is \$1707.45 and costs. Wolkotte has been acting as superintendent of the property, which consists of a number of claims and a milling plant of twenty stamps. During the past few months many improvements have been added to the equipment.

Sierra.

Transcript: At the Plumbago mine near Alleghany the dam across the Middle Yuba is completed and work is being crowded on the mile and a half of flume. An electric lighting plant is being put in. The machinery of the mine is to be run by compressed air that will be transmitted 6500 feet to the works, which are 1500 feet above the generating plant at the river side.

Siskiyou.

B. F. Thornton has returned from New York, where he sold a three-fourths interest in the Gray Eagle Con. mine of five claims near Yreka.

The company prospecting Yreka creek has finished the work from Shasta river to Yreka and will soon determine as to operating the property. Hunter & Co. at Cherry Hill are taking out quartz and awaiting the rains to start crushing. The miners along the Klamath are working day and night, anticipating the winter storms. The hydraulic miners throughout the county are prepared for successful operations as soon as supplied with water.

Report: J. Camp of Fort Jones sold the Portuguese Flat placer mine on Klamath river to C. C. Gilbert for \$2000.

Journal: The Yreka Co., driving a tunnel in Humboldt mountain, has reached a 7-foot ledge streaked with galena, at 570 feet, and 300 feet depth. The Pacific mine on Klamath river, has been paying big; the output this season will be the best known. The Spengler Bros.' claim at Humboldt is being shaped for winter work.

Yreka Journal: The Pacific mine on the Klamath river has been paying well lately. Several rich spots have been found that the pioneer drifters failed to reach. The Chinese Co. having a lease on the McConnell & Quinn mine at the lower end of the island in the Klamath river near Humboldt have been doing much work. At Benz Bar, Manzanita Bar and other places on the Klamath near Honolulu the miners feel hopeful of good returns.

Trinity.

In the Boulders mine near Carville the ledge has been cut 20 feet, and the wall has not been reached.

The Daly & Eckert mine, near Trinity Center, consists of 120 acres of gravel. The work done this season has been in the nature of equipment. A half-mile flume has been built and water conveyed to a reservoir, giving 300 feet fall. Hydraulic mining will begin in spring.

—Wallace & Mahoney, hydraulic miners near Junction City, are laying a pipe line and will soon be ready for work. Near Doeblinville Rogers & Thresher have cut a 14-foot vein of fair ore.

At Trinity Center a large force is cleaning out ditches and building new flumes for the Bloss & McClary gravel mine. The company will work on a large scale as soon as there is sufficient water. The mill connected with the mine is turning out 15,000 feet of lumber a day. It will require 350,000 feet for the construction of flumes. The Hill mine is sending ore to Delta on horseback over a mountain trail about twenty miles and thence by rail to the Selby smelter.

Tuolumne.

(Special Correspondence).—The Dreisam M. Co., like other properties in this county, is waiting for water to start its mill. The company has been taking out ore in its development work that has more than paid expenses. The Dreisam has been opened exclusively on the installment plan, which method has been quite a success. At the annual election last week the following officers were elected: G. Trittenbach, Pres.; B. Healy, Vice-Pres.; A. W. Livingstone, Treas.; A. Trittenbach, Gen. Mgr.; Geo. W. Gearhart, Sec'y. Soulsbyville, Oct. 17th, '98.

Banner: A spring layer of gravel has been disclosed at Springfield by the Tuolumne G. M. Co. at a depth of 84 feet. They have penetrated it 18 feet. The Wyoming mine, near Yankee Hill, will erect a 10-stamp mill. The Chaparral mine contemplates building a 10-stamp mill. Twenty men are employed at the Densmore mine, Parrot's Ferry.

Magnet: The Golden Key mine, owned by San Francisco people, on Moccasin creek, is being opened by a tunnel, in 400 feet, where it taps the vein. It is being extended 400 feet. At the Mt. Jefferson mine, Groveland, the shaft is down 180 feet on the ledge, the ore showing up well. Water is coming in so fast that a steam pump will have to be put in. Nine men are employed.

Union-Democrat: At the Donella mine near Sonora a new chute has been found. The property had been successfully worked for years, until a slide had cut off the vein, and after considerable work and expense the property was abandoned. Recently it passed to Coude & Co., who cleaned out and retimbered 185 feet of the old works and ran a 60-foot drift. They found a vein that runs from 15 inches to 5 feet. Ten tons of ore plated \$70, and yielded 1 per cent sulphurets running \$200 a ton. At the Rawhide the main shaft has reached 1500 feet. Drifting will be pushed both ways on the vein, which is from 30 to 35 feet wide. The forty stamps will soon be dropping. Everything is in readiness to receive power from the new electric plant. The new hoist will be run by two 200 H. P. engines. The plant will be capable of sinking 4000 feet. The Rawhide has been deeded to the App Con. At the Mt. Jefferson in Groveland operations are confined to shaft No. 2, which is down 230 feet. It is proposed to sink 400 feet. The vein is 7 feet wide, carrying 4 to 5 per cent sulphurets. Ten men are employed. The hoist is good for sinking 700 feet. A 10-stamp mill, to be run by steam, is contemplated. J. N. Meighan is Supt. At the Big Oak near Big Oak Flat, J. G. Moody Supt., the 5-stamp mill is run by steam. In the mine sixteen men are at work. Sinking continues. The vein shows from 5 to 7 feet of quartz. Baumgartner & Co., operating the Concord gravel claim near Springfield, after sinking 64 feet struck gravel, into which they sunk over 5 feet, but have not yet found bedrock. The gravel is said to average well. A steam hoist is contemplated. The Accident, owned by T. Reed, has been bonded to local capitalists, development to begin immediately.

Independent: The Agnes mine, near Sonora, has some good ore on the dump and will sink the shaft 100 feet deeper. At the Junction mine the shaft is 200 feet. The fissure is large. A new 11-inch water pipe line is being laid to operate the hoist and mill at the Bonanza mine. The 4-stamp mill began crushing ore last week with steam power. The shaft at the Eureka Con. at Carters is down 1670 feet and improvements about the mine are in operation, principal among which is the construction of a cyanide plant. Everything will be ready to begin work when water comes. The new 20-stamp mill of the Alameda mine, Jamestown, started last week under steam power. Stover & Shorey, bonders of the Doyle mine, near Robinson's Ferry, are running a tunnel to tap the vein at 500 feet depth; the ore body is from 12 to 20 feet. Kinzer & Co. have eight men working in the Tuolumne river, near Jacksonville. A dam 200 feet in length turns the river. As far as the work has progressed a good prospect is noted. Work has been suspended by the Stockton Gravel M. Co. on their ditch from the middle fork of the Stanislaus river, to be run to the old Philadelphia diggings, near Columbia. The ditch will carry 1500 inches of water, having a fall of 13 feet to the mile. The Brewer and Adams mines, operated by Pickle & Kenney, in the Blacket Creek district, are crosscutting for the pay chute.

Yuba.

Marysville Democrat: At Brown's valley work is progressing in the Pennsylvania and George Smithurst mines. Quartz is taken out of both these claims and the mills are crushing part of the time. Smithurst has only a 5-stamp mill, yet the quartz pays more than the expenses of extracting and milling. In the Pennsylvania some of the quartz is good.

COLORADO.

BOULDER COUNTY.

At Ward the Teller and Davis mines were sold last week to Boston capitalists, who will work them. The Teller has iron ore 2 feet wide that runs from six to fifteen ounces gold to the ton. The price is not made public.

News: The Revenge mine near Boulder made several shipments ranging from \$80 to \$125 per ton. The shaft house and machinery of the Franklin mine near Copper Rock were burned last week. The loss was \$2000. The Standard mine at Springdale has made its second cleanup, amounting to 110 ounces. H. H. Green has started a mill at Sunshine, which, it is claimed, is successfully treating the low-grade tellurium of that section. His process is said to recover from 80 to 90 per cent of the values at a nominal expense, making marketable ores as low as \$9 per ton.

CLEAR CREEK COUNTY.

The Puritan mine near Idaho Springs recently made a shipment of 17-ounce gold ore.

—From the Shakespeare at Freeland several tons are shipped daily. Arrangements have been made for the starting of the North Lamartine near Idaho Springs by Denver capitalists. Thirty tons will be shipped daily. The Edwards mill near Empire, the Silver Mountain and the Conqueror mills handle 500 tons of ore a week.

CHAFFEE COUNTY.

The Jasper mine, near Salida, recently bonded for \$17,500, is working two shifts.

EL PASO COUNTY.

The deal which has been pending for the Lillie claim at Cripple Creek closed last week. The Lillie mine and plant was sold to the Lillie G. M. Co., Ltd., of London, England, for 214,044 shares of stock in the new British corporation—a par value of £1 each.

Three feet of pay ore has been found in the Bonanza King, Cripple Creek, running from \$80 to \$400 a ton. A 100 H. P. electric motor is being installed at the Moon-Anchor to operate the pump at the 600 level. The Pinto at Altman is making an output of nearly 100 tons a week.

Record: Returns from an eighteen-ton shipment from the Matton lease on the Dante at Victor show values of from \$75 to \$200, according to grade. The bond and lease on the Mitchell mine were sold to a company represented by D. F. Campbell, who agree to put up immediately a new plant of machinery, push development for ninety days and pay \$15,000. This is aside from the purchase price of the property, which is \$50,000. The sale of the bond on the Lafayette, a fractional claim, was made for \$60,000 by J. B. Twitchell. The amount paid for the property, over and above the bond, is not made public. The production of the Gold Coin mine for September exceeded 2800 tons. A new hoist capable of sinking 1200 feet has been placed; two large hoists are now in operation, and new air compressors, as well as an addition to the boiler capacity, will be installed shortly. Stratton's mine has not yet started on the promised increase in output, but is shipping an average of forty tons daily, one-half of which is mill dirt and the remainder of smelting grade. The Areqa-Savage on East Beacon hill has been leased for two years to J. Dozier, representing Eastern people, for \$70,000.

Investor: From the Moon-Anchor last week 265 tons were shipped. Of the total, 200 tons were smelting ore and 65 tons mill ore. Simmons & Co.'s last shipment consisted of seven and one-half tons that averaged \$570 per ton, nineteen tons that went \$151 and twenty tons of \$55 ore. Estimates of Cripple Creek's September production show \$1,441,320. This is the largest production for any month since the discovery of the camp.

GILPIN COUNTY.

During September 495 stamps dropped in Black Hawk mills. They handled over 500 tons per day. The concentrators converted 1500 tons of crude ore into 500 tons of concentrates. Lessees of the East Notaway mine shipped to the Black Hawk sampler 20,324 pounds of ore that netted \$1610.46. The shipment previous netted \$1046.90. The values vary from \$29 to \$185 per ton. During September there were shipped from the Black Hawk depot of the Gulf road 336 cars of ore, 5368 tons.

Register-Call: Near Central City the Bon Ton mine has been leased for \$15,000 for two years to W. L. Ireland. The shaft is down 308 feet and the new operator will continue sinking it.

GUNNISON COUNTY.

The silver properties in the Tomichi district employ 150 men and ship considerable ore.

LAKE COUNTY.

Shipments of 130 tons per day are made from the Resurrection properties at Leadville. There are 110 men employed. The ore bodies in the Fanny Rawlins mine are 50 feet wide. The ore is said to net \$100 per ton in gold, silver and copper. There are sixty-five men working. Unwatering the thirty miles of workings in the basin mines at Leadville has begun.

News Reporter: The South Park people have everything in readiness for pushing work on their twenty-mile extension from Leadville to the mines and will have trains handling ore and passengers over the spur by January 1st.

Denver Post: The Iron-Silver M. Co. at Leadville began a few months ago draining this property. The company is a New York concern. Thousands of tons of ore are blocked out that can be mined to a profit, and there is a large territory open for exploration work. During the past two months the pumps have been going steadily, handling 30,000 gallons per hour and draining the levels and drifts which for the past six years have been filling with water. The second level is under control and a big compound pump will be placed in position, which will handle still more water. The Rubie and Minnie lease is showing up nicely and shipments for the last month were about 500 tons of ore, mostly lead sulphides. The Rubie is about 525 feet deep. The property is a part of the Iron-Silver group. It is stated by some of those who handled much of the ore taken out of the Leadville mines last month that the tonnage was about 18,000 tons.

OURAY COUNTY.

The Fowler smelter at Ouray is receiving ore from thirty properties, more than twice as many as at this time last year. The Tom Boy pumping station at Lake Pitanigan, was burned last week, together with 400 tons of coal, and engines.

PARK COUNTY.

The mines in the Hill Top district are sending down 110 tons of ore per day over the tramway. A miner who gathered up the ore spilled from the tramway recently received \$400 for the lot. The Mabel Grace mine, in the Freshwater district, is said to have a 40-

foot body of ore that averages \$8 per ton in gold.

PITKIN COUNTY.

Denver Mining Record: The Smuggler mine at Aspen is again on fire and will probably undergo another siege similar to that of eleven months ago. The fire in progress is above the sixth level and in a smaller slope than the one a year ago.

RIO GRANDE COUNTY.

Denver Mining World: The pumps have been started on the Mammoth mine, near Platoro. As soon as the mine is unwatered two shifts will be put at sinking and drifting under the big body of ore opened up in the tunnel.

SAGUACHE COUNTY.

The Commodore mine at Creede is working a force of about 200 men and is the heaviest shipper in the district. The electric lighting system for the tunnels and ore houses is nearly completed and is a credit to Mr. Moore.

SAN JUAN COUNTY.

The strike in the Anadue mine on Hurricane peak gives mill-run tests of 11 ounces of silver, 12½ per cent copper and \$6 in gold. The Silver Ledge mine at Chattanooga is producing fifty tons of ore a day of an average value of \$9 a ton and about ten tons daily of concentrates.

Silverton Miner: B. D. Smith shipped a carload of silver ore from the Silver Queen mine near Silverton. Next spring a 100-ton concentrator and a tramway will be placed upon the property. The mine produces twenty tons of milling ore to one ton of high-grade shipping ore. The Gold King M. & Co. Co. output in concentrates is sixteen tons daily.

SAN MIGUEL COUNTY.

San Miguel Examiner: The Japan mine and concentrating plant near Telluride are running full capacity and employing 100 men. The mill is treating sixty tons of ore and turning out from fifteen to twenty tons of concentrates every twenty-four hours. The concentrates average \$100 per ton in gold, silver and lead. To this output of \$50,000 per month may be added returns from high grade ore shipped to smelters. Several carloads are shipped weekly and net from \$750 to \$1000 per car. A. G. Kirby has a California canvas plant in operation below the Japan mill, which is successfully treating the tailings. The Nancy Hanks at Saw Pit is added to the shippers from that camp. The Contention group in Bear creek is pending sale to Boston capitalists for \$275,000, and the prospective purchasers are exploiting the property. The Valley View mill, on Marshall creek, is disposing of twenty-five tons of mineral daily. The ore is free milling and runs principally in gold. The ore averages \$15 per ton, yet the mine is said to be one of the best dividend payers, considering the scale on which it operated, in the district. The vein ranges from 10 inches to 4 feet wide and the value is uniform. The 10-stamp mill is connected with the mine by a wire rope bucket tramway 2000 feet long, and every known device has been put in for the cheap handling of the product.

SUMMIT COUNTY.

Journal: After nearly ten years and the expenditure of over \$100,000, the Mountain Pride Co., near Breckenridge, the past two weeks disclosed several ore chutes; the vein varies from 2 to 4 feet, the ore values being two ounces gold, fifteen ounces silver and 7 per cent lead.

The El Dorado mine, at Robinson, is shipping forty tons daily of sulphide ore. It is mined at a depth of 1100 feet.

IDAHO.

Near Wallace a strike was made in the Standard mine of 9 feet galena, 60 per cent which is clean shipping ore, in the first level below the permanent water line in the mine. The strike is 1100 feet below the surface. The ore assays from 67 to 70 per cent in lead, and from 58 to 61 ounces in silver. This is better than the ore bodies above, from which the Standard people have paid their dividend running from \$50,000 to \$80,000 per month. The mine, under the management of J. A. Finch and A. B. Campbell, is employing about 150 men and shipping 300 tons of ore per day. The new ore body will be opened up as rapidly as possible and shipments will be increased. The company has ordered a new hoist, which will be installed about Dec. 1. It will be large enough to sink 2500 feet below the level and will cost \$40,000.

Idaho World: The Tyrannis mine at Ketchum has begun work on a 900-foot tunnel. The pipe line for the Lucky Boy mill will be a mile long. The Bunch quartz mine near Grimes Pass, has a shaft 200 feet. Two shifts are putting a raise from the drift to the surface, following the vein. The ore is big grade in free gold. It is owned by a Texan company, who contemplate erecting a star mill as soon as spring opens. Woodburn Anderson's 5-stamp mill at Grimes Pass crushing high-grade ore from the Pheasant mine. The Wells arrastra is running. Work is progressing at the Morning Star. Some placer mining is still going on along the Upper Grimes creek.

Hailey Times: E. B. Kirby of Colorado examining the Hope group of mines for the company; he has six men to assist him and will take him a week longer to complete his examination. Future operations of the company will be based upon his recommendation. About thirty men are at work on the pipe line for the new Tiptop mill. The pipe is to be laid in a trench 3 feet deep and over 11,000 feet long.

Boise Statesman: The Bedrock Dredge Co. has its dredge at Placerville in operation. It has a capacity of 3000 cubic yards per twenty-four hours. The machinery on the boat is run by five electric motors. The Boise Dredging Co. is building a sister machine to that at Placerville, near Centerville to be completed December 1st. The power

of the Boise Co. on lower Grimes creek furnishing power for the Placerville dge, and will do the same for the Center machine when it starts. Its capacity is H. P. It also furnishes light for the boats at night. The power house is twelve miles in the dredges. The current from the ice-phase generator is carried on three No. 10 copper wires. The pressure used on line is 10,000 volts.

MONTANA.

The Nancy Hanks at Basin shipped nine carloads of ore to the smelter last month. The Mouton mine at Neihart is closed while a concentrator is being built. Experts have examined the mines of Neihart and find that the ore in nearly all the mines can be concentrated.

The dredging plant of the Cooney Placer near Sheridan is making fair progress in its machine, although bedrock has not been reached. A 300-ounce cleanup recently the result of a week's run. The concentrates at the Leiter mill, estimated at 20 tons, will be shipped to East Helena this and winter. They are, for the most part, grade, but carry a high percentage of which makes them valuable for fluxing. The dredging system in use by the Ban-placer companies is a complete success. A result of two seasons' operations one of machines has worked an area 1900 feet by 600 feet wide and 35 feet deep. The mine of Siltes is shipping four carloads of high-grade ore, which it packs four on horseback. It yields gold and copper will pay even under such conditions.

The Anaconda Copper Co.'s report shows it made in working low grade ores. The company's average 4.26 per cent copper, ounces silver and 0.011 gold per ton. The return to the ton of ore treated for year ending June 30th, '98, was \$11.22. The company shows net profits equal to 11.8 cent on the capital stock—\$30,000,000—and a 10 per cent dividends. The report shows of the total expenditure for the year 1900 costs contributed 41.7 per cent, reduction 45.3 per cent, freight charges 5 per cent, refining at seaboard 7 per cent, interest general expenses 1 per cent. The total of extracting metals from the ore and refining them in marketable form was \$7.125.

Placer Miner: The pumps have been started at the Pilot mine for the purpose of expert excavation. If the property passes a company reopen it.

Placer Miner: Development is going on in the Cora mine near Butte, which is under lease by the Montana O. P. Co., though the training order secured by W. J. Ladd, assessor of the Boston & Montana, has opened ore shipments for the present. The ore on the lead from which ore was being mined is 300 feet long and only 55 feet of this is in controversy. J. R. Toole, the expert on the Anaconda Co., visited the Moose Lake district, near Phillipsburg, and inspected copper properties being developed there. He stated that the Anaconda Co. tried to acquire a bond on the property for \$100,000. It consists of a group of claims on all of which there has been considerable development work and the showing is said to be good.

The Silver King mine has opened a vein of ore averaging sixty ounces, the ore body from 30 inches to 5 feet wide. The strike was made at a depth of 178 feet. There are twenty-three men at work.

Indianian: The Lester mine, near Virile City, has been sold to W. A. Clark, who said to have paid \$100,000. It was discovered a year ago; nine months ago it was sold to Helena people, who, after working some time, abandoned it.

Dillon Examiner: The new dredge boat of the Bon Accord Co., at Bannack, last Sunday sank to settle and sank within fifteen minutes. It turned in sinking and lies on the bottom of the creek with one side of the hull totally above water. Mgr. Ball is unable to assign a cause for the accident. Experts are investigating and also arranging to raise the boat. The silver smelter at Great Falls to resume operations with about 175 men—more than at any time since 1893. It is understood the company also contemplates leasing mines in Neihart and Barker.

NEVADA.

Near Wadsworth a quartz mill of ten tons capacity has been erected for crushing ore from mines in the district. J. Smith is leaching the tailings of the old Wilson mill at Pine Grove; made a good cleanup of auriferous, and reports the work resulting satisfactorily.

Near Dayton, R. Logan has made a successful cleanup at his Como mill of 450 tons of free milling grade, enough to pay for mill and bring and leave a profit. In the Golconda copper district at the Adelaide group of mines a mill, smelting and crushing plant has a capacity of 300 tons. The lowest works are on the 250 level. The railroad from the mine to the reduction plant, twelve miles, will be completed by Dec. 1st, when extensive operations will begin. The company employs seventy men, but expects increase that number to 900 in two years. Aurora, Esmeralda county, now has but a few residents employed in doing annual holding work on unpatented mining claims and at Raymond's cyanide plant. Schultz & Pfeiffer's stamp mill, two miles from Aurora, is crushing ore.

The mines at Ione and New Pass are being worked steadily, though with a decreased number of men at the first named place. Ickett & Miller, who recently bought the ranch or Deer Trail group at Pike's Diggins near State Line, are working a good ore and taking out high-grade gold ore.

Another reverberatory furnace has been started at the Golconda plant, which gives three furnaces and two roasters. The Dextr of Tuscarora shipped eleven and one-half tons of ore, amounting to \$6095.93, and auriferous of \$3800, increasing the cleanup for

September to \$21,195. The ore yielded \$526.92 per ton, being 26.65 ounces gold and 20 ounces silver. Sixty days ago a lot of high-grade showed a valuation of 16 ounces gold and 18 ounces silver per ton. Ore of this quality, which appears and disappears in the main body, is not trusted to the plates, and while shipments are made only at long intervals, about \$25,000 has been derived from them since September, 1897. Only ten stamps were dropping in September. At Cherry Creek a company has been formed for the erection of a 100-stamp mill to be built at Chin Springs, the mill and mine to be connected by a railroad or tramway six miles long. About fifty men are employed there. The Glasgow & Western M. Co. has made another payment on the Copper canyon group in Lander county of \$25,000. The Copper canyon group was worked years ago, and was productive of considerable ore. The long haul to market caused it to be closed. Under the present owners it affords employment for twenty miners. The output last month was 200 tons of ore that afforded a good profit, and the company is pleased with its investment.

In the mining camp of Jumbo, on the west side of Mount Davidson, nearly eighty men are working and all are pleased over the prospects. The Bulldog M. Co. of Dayton has found good gravel.

The English company operating the Churchill county nickel mines near Lovelock are reported to have perfected a process of producing nickel salts directly from the ore. The salts are used extensively in nickel plating. There are large resources of nickel ore in the mine.

Silver State: Brim, Deegan & Cowden have sold the Deno mine in Pueblo district, Humboldt county, for \$50,000 cash. The mine is a dividend payer.

NEW MEXICO.

In the President mine, near Elizabethtown, there is said to be a vein of uranium, carrying \$9 in gold and \$3 in silver.

The Hematite mine at Red River has started up, and a stamp mill is promised shortly for that locality. C. B. and J. A. Eddy will send 100 tons of ore from their Jarilla mines to the smelter. The Modoc mine in Dona Ana county has closed down because of pending litigation. The old copper mine at Red River, formerly owned by the Waltham Watch Co., has been bought by Chicago people. A body of shipping ore has been struck in the San Andres mining district, Dona Ana county, by Hopkins & Sherfy, which promises a mill for that district.

The Cocchi Gold M. Co. shipped a seventy-four-pound gold brick, the product of one week's run. The Bland mill is adding two agitating tanks to its plant. Maj. Beaumont of Bland has resumed work on the Ivanhoe, Cap Sheaf and Ivanhoe claims, the first of which shows a lead of quartz 35 feet wide. The Bland and Albemarle mines are working day and night shifts.

Silver City Enterprise: The Pinos Altos G. M. Co.'s properties are being developed prior to the erection of a large milling plant. The probability is that the ore will be concentrated and the auriferous pyrites shipped to the Silver City reduction works. The present mill at Pinos Altos is being used for the experimental work both for concentration and amalgamation. In the Atlantic mine the ore bodies on the lower levels are showing much better in size and grade of ore. The shaft has reached 650 feet. Drifts are being driven on the fifth and sixth levels. The ore on the fifth level is 18 inches in width.

On Pinos Altos mountains are two silver mines, the Silver Cell and the Climax, generally known as the Dimmick mines. The properties produce native silver in large quantities, pieces weighing from 50 to 200 pounds, that run over 50 per cent pure silver. In addition to this there is a vein of lower grade ore running from 50 to 150 ounces of silver per ton. The owners brought down over 2000 ounces of silver last week. The small adobe furnace will be replaced by a water-jacket furnace which will be in operation in sixty days. At Central, M. Ruthenberg bought the St. Helena, "88" and No. 3 mining claims for \$35,000 and put a force at work. The Texas shaft has passed the 450-foot mark in depth and shows a good body of ore. The company's new mill will be in operation within a few weeks. The copper mines of Santa Rita have temporarily suspended operations on account of the small-box scare. It was found difficult to stop the native miners from holding communication with their relatives of the infected districts on the Mimbre. Hence it was considered best to suspend operations for a short time until stringent quarantine regulations can be put in force. A contract has been made by the Carlisle D. Co. with a company to erect a cyanide plant at Carlisle to treat the pile of tailings left by the old Carlisle Co. The plant will have a capacity fifty tons per day to start with and will probably be increased. The pile of tailings is estimated to contain 128,000 tons and the average value is \$6 per ton.

OREGON.

The Swayne M. Co. of Applegate, has been doing a large amount of work and will soon be mining on an extensive scale; 13,000 feet of flumes and 17,000 feet of ditch have been built. Water was turned on this week. Operations have resumed at the Hammersley mine in Jump-off-Joe district. San Francisco capital is said to be interested. M. Stephenson and W. Ireland of Grant's Pass, accompanied by Thos. Crouch of Montana, inspected the Oregon Belle quartz mine in Forest Creek district.

Grant's Pass Journal: S. N. Butters & Co. bought 520 acres of ground near Grant's Pass and will build a three-mile ditch and run 1000 feet of tunnel. Part of the property will be worked by elevator and a portion by hydraulic process. E. W. Roberts of Oakland, Cal., who bought the Ida quartz mine, has put men to work on it. It is locally reported that good ore is being taken out at the Mattern

mine, of the Ashland group. The E. & E. mines, at Bourne, are employing 100 miners. A 1000 foot shaft has been started. The mill is being enlarged and is to be run by water power. Chapman & Cronk have leased the Tuller placer at Glendale and will work it this winter. The Isabel M. Co. has incorporated under the laws of Oregon, at the head of which are P. S. Anton of Chicago and K. Mallory of Portland. The property is near Glendale. The company will build a 20-stamp mill, with shafting and power for sixty stamps, also concentrators and a chloride plant.

Sumpter News: The Colorado mine, near Sumpter, was sold recently to H. B. Compson & Co. for \$5000. The mine has not had much development. The new owners will put in a complete plant. Five carloads of 16 inch pipe for the electric power plant at Golconda arrived in Sumpter and are being hauled to the mine.

Baker City Democrat: Since the incorporation of the Great Northern M. Co. by Salt Lake people, the management has added to its holdings seventeen adjoining claims and two water ditches and water rights. Included in the ground are eighty acres of placer diggings, which will likely be operated in the spring. It is more than likely that the company will erect a mill in the spring. The Gold Ring M. Co., near Baker City, has a force at development work. Mining operations at Gold Ridge will again be active. Col. Panting has put on twenty men and work will be carried on all winter.

UTAH.

The Galena, at Fish Springs, from the ore body of the 300 level, yields 80 per cent lead, and all of it carries a high average in silver as well as lead. The Martha Washington, at Silver City, which was closed down for several days following the accident in which two lives were lost, has started up again. The drift on the 350 level is pushing ahead on ore. At Tintic the Sioux mill has been making a test run on low grade Swansea ore, from which a car of concentrates was shipped. If the test shows that it can be handled to advantage, the Sioux mill will run hereafter on Swansea ore. The ore is low grade, pyrites of iron predominating.

About three tons of cyanides were shipped from the Golden Gate mill at Mercur last week, said to be valued at \$200,000. The Omaha is showing values running from \$7 up to \$10 a ton.

The ore shipments last week from Park City were 1,710,000 pounds. At Monticello a stamp mill the past three months made a profit for the mine owners of \$200 a month. This is restoring confidence in the mining resources of that part of the country.

During September the Silver King of Park City marketed 2,399,760 pounds of crude ore and 1,855,395 pounds concentrates. The output of the Niagara at Bingham is averaging about six cars of ore a week, which yields 25 per cent lead, ten ounces silver and \$3 gold per ton. Developments on the Silver Lode mine at Mercur have been temporarily suspended. Lowery & Dewitt at Silver City are raising ore that assays from 60 to 500 ounces silver and 20 per cent copper per ton.

Tribune: The Monte Del Rey G. M. & M. Co. in Marysvale are taking out ore assaying fifty-six ounces silver and \$24.21 in gold to the ton. They have a ledge 8 feet wide. Assays from the ledge in the War Eagle in West Tintic, show 175 ounces in silver, 35 per cent copper and \$1 gold. The ore body is extensive and is on the 200-foot level. Recent mill runs on the Midas ore, Deep Creek, having resulted satisfactorily, John Dern, one of the principal owners, says that the erection of a mill will be undertaken next season. What the capacity of the plant will be has not yet been decided on. The ore bodies have increased with development during the year. It will be the first plant of this kind undertaken in that portion of Utah's diggings. At the Honorine, at Stockton, good progress is made cleaning out the long tunnel, from which the prospecting of the ground is to begin; work will continue all winter. The Ophir Con. is loading an average of fifty tons of concentrates daily and the Hercules is shipping crude ore daily. The Silver King is turning a good quality of ore. At the Orient, West Tintic, sinking is to be resumed. Good ore is being taken from the drifts. The Highland Boy at Bingham has material en route from the East weighing 2,050,000 pounds, for its smelting plant, and this is but a fraction of what is to come. More than 100 persons are engaged on the site.

WASHINGTON.

The Republic mine at Washington is shipping ore as usual, the mill being fully supplied, and all the freight wagons available in use. Machinery for the mill is en route from the railroad and will be put in place as fast as it arrives. The shaft on the Bryan & Sewell is down 126 feet. The crosscut on the Little Cove shows 14 feet of ore. The north drift is being driven 3 feet each twenty-four hours. The ledge has been followed for 400 feet.

At Republic, in the San Poil mine, there is 5 feet of ore that is said to average \$45 per ton. The drift is 300 feet below the surface.

FOREIGN.

BRITISH COLUMBIA.

At Rossland another strike is reported in the Le Roi, 8 feet of ore averaging 18 per cent copper, \$50 in gold and 10 ounces in silver. Shipments from Rossland for the week ending October 15th were 3815 tons.

Near Brooklyn the Golden Gate D. Co., which bought the Mountain Chief group of copper claims for \$10,000, has begun development of the property. The manager of the Vancouver group of claims near Silverton reports that the sampling of a carload of ore yielded 362 ounces of silver to the ton. Two hundred tons of Stenwinder ore in Fairview camp yielded \$7 per ton in gold.

Rossland Miner: Moyie City has three shipping mines. The St. Eugene has 2000 tons of

ore ready for shipment. The Lake Shore mine will commence shipments as soon as cars are available. The Queen Bess mines, Slo-can, will, during the sleighing season, make shipments at the rate of 400 tons per month.

The Yellowstone property at Rossland has been sold. It is locally claimed, to the War Eagle people for \$50,000. The Sunshine mine, Lardue, this year has shipped about \$100,000 worth of ore to the American and Kootenay smelters. In silver values the shipments have averaged between 200 and 225 ounces, with about 30 per cent lead and \$3 to \$12 in gold. There is sacked at the mine about 200 tons of similar ore, while on the dump is a quantity of concentrating rock, averaging about \$35.

MEXICO.

In the Pilares de Teras district, Sonora, the Roy mine is making large shipments of ore to smelters in the United States. The ore runs from 400 ounces up to 5000 ounces per ton in silver. R. Bartlett has disposed of his bond on the Santa Gertrudis mine to J. E. Wilbur of California who has begun to unwater the mine.

The Chihuahua Enterprise says thousands of dollars are being invested in Chihuahua mines and the most modern machinery being put in, and that there is every sign that the output from the mines will show a large increase this year. The disadvantages which Americans have had to fight against are disappearing, and chances for American labor and American capital are brighter.

A new mine of galena is being opened up near Zuisamopa, Sonora. El Cobre de Motezuma is the name of a gold, silver and copper mine being operated by G. Price & Co. near Motezuma, Sonora.

Detroit and Milwaukee capitalists have organized the Mexican Smelting & Refining Co. and have bought large mining properties at Sultepec. The property will be worked on a large scale. A smelter, to cost over \$100,000, is to be erected and connected with the mine by a ropeway two and a half miles long. The mine produces silver and manganese ore.

NEW SOUTH WALES.

Australian News: Tin mining in New South Wales continues on the down grade. Competition with the Straits mines, which pay their men in depreciated currency, is gradually killing the Australian industry. In 1881 the output was valued at £568,795. In 1897 it was less than one-tenth of that amount, being only £49,000. There is abundance of known tin country still unworked, but at the present price of the metal it will have to remain in a state of nature until, what is hardly likely, the Malay miners can successfully demand the same wages as are paid to Australians, or on the other hand, till Australian wages sink to the same level, allowing for the superior efficiency of the miners as those paid to the Malays.

NOTICE TO CONTRACTORS.

WATER WORKS.—Sealed proposals will be received on or before 12 M., November 15th, 1898, for the construction and completion of certain additions to the existing water works, owned and controlled by the City of Seattle, to wit: Two gutters, include a gravity water supply from Cedar River, reservoirs and portions of an auxiliary high-service system in the city. The contract to be let will embrace the following general items of construction: Head works on Cedar River, consisting of Diverting Weir, Intake Canal (400 feet long) and Settling Basin. Pressure Pipe to City, 42 inches diameter, 28.4 miles in length; of which 6.4 miles are to be riveted steel and 22 miles to be stave-pipe braced with steel bands 4 inch diameter. High-service Reservoir in City; capacity 16 million gallons. Low-service Reservoir in City; capacity 20 million gallons. Auxiliary High-service Steel Stand-Pipe, 30 feet diameter by 80 feet high, incased in Reinforced concrete. Pumping Main to Stand-Pipe, 13,200 feet 12-inch Kalamain Pipe; 2500 feet 16-inch Kalamain Pipe; 36-inch Stave Pipe, connecting reservoirs, about one mile in length; 30-inch Stave Pipe, 3000 lineal feet waste water discharge pipe. Reservoir; 30-inch Riveted Steel Pipe, 4800 feet length, connecting Low-service Reservoir with distribution system. Changing Cedar River Channel, 60,000 cubic yards excavation. Clearing, Dam and Connections at Swan Falls. Two Gutters, Specials, Valves, etc. The contract to be entered into will provide that payment shall be made for this work only by warrants upon the "Cedar River Water Supply Fund of Seattle," as created and established by Ordinance No. 3464 of the City of Seattle, and the contractor shall have no claim against the city except as therein provided. By said ordinance 75 per cent of the cash receipts of the entire city water system are involuntarily set aside and pledged to the payment of interest at 5 per cent per annum and the gradual redemption of said warrants. In addition to the warrants, which will be issued in payment for the construction of said additions, the contractor is required to purchase at par any and all warrants which shall be drawn on said fund by the city in such amounts as shall be required to pay for any real estate, rights, easements or privileges necessary for the prosecution of the work of construction and the perpetual control by said city of the additions to the water works herein specified, whether obtained by purchase, agreement or condemnation proceedings, and also such warrants as shall be drawn upon said fund by the city in payment of engineering and other expenses necessarily incurred in connection with said additions; provided that the amount of the warrants thus required to be purchased by the contractor shall in no case exceed the sum of Sixty-four Thousand Dollars. Each bid must be accompanied by a certified check, payable to the order of the City Comptroller, for a sum not less than five (5) per cent of the bid, and no bid will be considered unless accompanied by such check. The successful bidder will be required to enter into a contract and furnish satisfactory bond for the amount required by the City Charter and the laws of the State of Washington, within ten days after being notified of the award of the contract to him; failing so to do, the said check and the amount fixed therein will be forfeited to the city. No person is eligible as a bidder who has within two years prior to the letting of said contract made a default in payment of any and all wages or labor performed, or any skill or material furnished pursuant to any such contract as herein advertised, or who within said two years failed to complete any such contract. Special attention is called to Article XXIII of the City Charter, as now in force, relating to "hours of labor," and to Article XIII, Section 31, Subs. 1 and 2, relating to bonds and surety. All bids must be made in accordance with and comply with the plans and specifications now on file in the City Engineer's Office, and in compliance with Ordinance No. 3990. The City of Seattle reserves the right to reject any and all bids. Proposals must be indorsed on envelope "Bids for Constructing Certain Additions to the Water Works of the City of Seattle." By order of the Board of Public Works.

Engine

BUILT FOR THE
Anaconda
Copper Mining
Company
OF MONTANA.

Embodying all that
experience and
practical working
have demonstrated
as valuable in this
class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the Mining and Scientific Press. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

WHITE, ROGERS & CO., Consulting Engineers and Millwrights,

OFFICE, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, \$450, F. O. B., San Francisco.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

— SEND FOR CIRCULARS. —

These Machines are Kept in Stock Ready for Immediate Shipment.

KNIGHTS' WATER WHEEL.

The accompanying cut shows the general arrangement of Knight's Standard Water Wheel of which there are hundreds in use in different States of the Union.

These Wheels are made from 2 feet to 6 feet in diameter, from 10 to 1000-horse power, and adapted to all heads and purposes.

Wheels inclosed in iron cases, from 6 to 24 inches.

Wheels for electrical power can be furnished with or without Governors. Highest regulation guaranteed.

HENSHAW, BULKLEY & CO., Agents, - San Francisco, Cal.

Guaranteed equal to Jessop's or Firth's in rock work.

CANTON STEEL COMPANY, Works : CANTON, OHIO.

CANTON EXTRA DRILL STEEL, WARRANTED.

Canton Drill Steel is a strictly hammered steel made exclusively from one brand of stock which the experience of years has demonstrated to be the best for producing the greatest combination of hardness and toughness.

There is no mystery in the art of working it. Clean fire, clean water and the same good judgment employed in working any imported steel will produce the tough, strong bit for hard rock mining.

IMPROVED PORTABLE HOISTING ENGINES

Sole Manufacturers of

Kendall's Patent Quartz Mills.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at Greatly Reduced Prices. Having made and sold these mills for the past 16 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap and durable mill that will do all that is claimed for it and give entire satisfaction.

In carload lots, 10¢ per keg less.

Mining Share Market.

SAN FRANCISCO, Oct. 20, 1898.

"Buy 'em on the slumps and sell 'em on the jumps" at present seems to be more of a silent precept than an active duty, for, though all the Comstocks are so low that the question arises how much lower they can go, yet very little is done, the business being but a shadow of its former self.

Assessment Notices.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill, Placer County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of September, 1898, an assessment (No. 13) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Nos. 1209-11 Claus Spreckels building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of October, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 1st day of November, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. J. CRAWFORD, Secretary.
Office—Nos. 1209-11 Claus Spreckels building, San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of September, 1898, an assessment (No. 16) of 2 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 31st day of October, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of November, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CHARLES BOVONE, Secretary.
Office—217 Sacramento street, San Francisco, California.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of October, 1898, an assessment (No. 21) of 2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 106 Leidesdorff street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of November, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of November, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CALVERT MEADE, Secretary.
Office—106 Leidesdorff street, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3rd day of October, 1898, an assessment (No. 11) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of November, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 5th day of December, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
F. METTMANN, Secretary.
Office—237 12th street, San Francisco, California. The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22nd day of August, 1898, an assessment (No. 4) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 916 Market street, Room 57, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3rd day of October, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 31st day of October, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
GEO. W. FLEISSNER, Secretary.
Office—No. 916 Market street, Room 57, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the National Cons. Mining Co., the day of delinquency of the above assessment has been postponed to MONDAY, 1st, 1898, and the day of sale to FRIDAY, November 25th, 1898.

GEO. W. FLEISSNER, Secretary.
Office—No. 916 Market street, Room 57, San Francisco, California.

| W. H. Bailey, Jr..... | 147 | 1,000 | 15 00 |
| W. H. Bailey, Jr..... | 148 | 1,000 | 15 00 |
| W. H. Bailey, Jr..... | 149 | 1,000 | 15 00 |
| W. H. Bailey, Jr..... | 150 | 1,000 | 15 00 |
| W. H. Bailey, Jr..... | 151 | 1,000 | 15 00 |
| W. H. Bailey, Jr..... | 188 | 2,500 | 37 50 |
| W. H. Bailey, Jr..... | 208 | 4,000 | 60 00 |
| W. H. Bailey, Jr..... | 209 | 532 | 7 98 |

And in accordance with law, and at order from the Board of Directors, made on the 16th day of May, 1898, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Room 508 Safe Deposit building, San Francisco, California, on TUESDAY, the 1st day of November, 1898, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

E. L. CHENEY, Secretary.
Office—Room 508 Safe Deposit building, San Francisco, California.

To Our Customers and Friends
on the Pacific Coast:

Through frequent complaints made to us, we have learned that unprincipled and dishonest dealers on the Pacific coast have counterfeited our trademark numbers and substituted inferior, spurious goods as ours, when ours were distinctly ordered, thus defrauding the customers and injuring our trade and reputation.

Our goods are acknowledged to be the best, and are fully warranted by us, and are marked with our name or initials or with our well-known trademark and catalogue numbers.

We request direct notice if any goods alleged to come from us, or bearing our trademark or numbers, prove to be other than the best, and perfect in every respect, as we will follow up and expose such frauds for our customers' and our own protection. We have no exclusive agents on the Coast, but our goods are obtainable from all respectable dealers in drawing materials, stationery, hardware, artists' material, etc. Respectfully,

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact.

RAWHIDE GOLD MINING COMPANY,
JAMESTOWN, TULUMNE CO., CAL., Feb. 21, 1897.
Yours truly,
W. A. NEVILLS, President.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent-Lipped flange the best.

Draining the Comstock.

The movement toward drainage and resumption of deep mining in the Comstock, Nev., lode received a material advance last Saturday, when, at a meeting in San Francisco of the Executive Committee of the Comstock Pumping Association, a contract was ordered made with the Risdon Iron and Locomotive Works of San Francisco with intent to drain the water 500 feet below its present level. The agreement is to supply machinery for such proposed drainage, the plant to be placed in a station on the Sutro tunnel level of the C. & C. shaft. For such drainage the contractors are to receive \$30,000, in six equal installments. No water exists in the Comstock above the 1600 (Sutro tunnel) level, and that will be used as the base of operations. The contract involves the furnishing of apparatus with a daily pumping capacity of 10,000,000 gallons from the consolidated shaft into the tunnel, and its operation till the water is lowered 500 feet below its present level. Payment is contingent upon the lowering of the water. The method proposed is by a water jet working under a head of 2000 feet, discharging through a contracted throat, the vacuum produced by the pressure and velocity of this water carrying a continuous stream up from the flooded levels to the Sutro tunnel, through which it is to flow. Vice-Pres't R. S. Moore with Thos. J. Barbour and F. M. Leland represented the company. G. McM. Ross, H. M. Gorham and W. E. Sharon constituted the advisory board of mining superintendents who recommended that the contract be awarded in accordance with the proposal received. The machine by which it is proposed to do the work is naturally an object of interest to miners everywhere, and is herewith illustrated. It is the well-known Evans hydraulic elevator, built by the Risdon Iron Works, and for several years in use in hydraulic and river-bed mining. Its principal features are the three suctions, one main and two auxiliary, the latter capable of extension with any size pipe to any distance. At the Golden Feather mine in Butte Co., Cal., in 1897, one of these elevators is credited with throwing 18,000,000 gallons of water every twenty-four hours. It is figured that with a head of 2000 feet pressure as proposed, there will be no insuperable difficulty in the daily ejection by this machine of at least 10,000,000 gallons of water from the lower levels of the Comstock.

The magnitude of the work, the very low cost named in the contract, and the comparative novelty of the appliance in connection with that class of work, all tend to make the project one of general interest to mining men. The Risdon Iron Works is confident of its ability to do the work as proposed, and the Comstock Pumping

THE EVANS HYDRAULIC ELEVATOR.

MOTOR AND PUMP FOR TANK USE.

Association which had devoted \$100,000 to the preliminary work of unwatering, etc., are gratified to have a proposition from a responsible firm to do that part of the work at so low a figure.

It will probably be toward the close of the year before active operations will begin.

Electric Pumping.

A compact pumping outfit for house tank and similar service is illustrated herewith, of a type which is in use for a variety of purposes, and especially designed to supply the reservoir tanks of high office buildings and residences, where the pressure carried in the city mains, insufficient to elevate water above the lower stories, must be reinforced by pump pressure. The motor is connected to the pump entirely by bolt, and, no cut gears intervening, the operation of the pump is noiseless. The motor is of the C. A. type—a type designed and manufactured by the General Electric Co. to meet a demand for motors adapted to the direct application of power to small machines. It is built of 2 H. P., 1 H. P., $\frac{1}{2}$ H. P. and $\frac{1}{4}$ H. P. The first three are wound for use on 115, 230 and 500-volt circuits, the $\frac{1}{4}$ being wound for 115 volts only. They are light, compact, occupy little floor space, and by a single change in the position of the bearings may be run in any position. The magnetic circuit is of laminated instead of cast iron, the armature of toothed laminations with coils made up and insulated before application. The motor is mounted upon the base of the pump, making the combination one of the most compact on the market. The motor is stopped and

started by an automatic switch operated by a float on the water in the tank. These pump combinations are built for capacities of 200 and 500 gallons, as required.

THE subject of treating zinc-lead ore is still one of discussion. The communication on page 425 is published for the information it contains. It is only just to say that its writer is in error in his opening assumption. The editorial item he refers to was in comment on a communication from the general manager of an English smelting company to the editor, in which he suggested that his firm could successfully treat that class of ores and gave detailed figures thereon. It was this trans-Atlantic proposition that was deemed "impracticable," an article in a preceding issue from a Colorado miner illustrating by Colorado charges that it would be unprofitable and unnecessary to send such ores to London. The article on page 425 additionally discusses another aspect of the question, throwing light on existing commercial conditions.

IF, as it now appears, the Leadville, Colo., mines are to be unwatered and work resumed, the resultant tonnage of silver-lead ore will renew the required smelter supply, for which the Cœur d'Alenes, the Kootenay and Mexico have for the last two years been drawn upon.

PATENT COMMISSIONER DUELL has been enabled to catch up with some of the arrears of his office and hopes by July 1st, '99, to have clerical matters so expedited that action may be taken on applications for patent within six weeks from the time of filing. During the session of Congress beginning next December it is proposed to give the U. S. patent laws needed and thorough revision. The presidential commission recently appointed are now preparing their report.

THE "Molly Maguires" of the Cœur d'Alenes, Idaho, have ordered Shift boss Conner of the Standard mine out of the country, with the alternative of murder in case of refusal. His offense is the discharge of incompetent men. Some time ago Whitney was murdered, and before him Kneebone was made away with, for, practically, the same reason—personal dislike. Those thugs control that region, to the shame of Shoshone county and the disgrace of all who uphold or condone such un-American methods.

THE latest "mining boom" is in copper and commercial events justify activity in copper mining. It is constantly appreciating in demand, and consequently in value. Michigan, Montana, Arizona and Colorado are profitably mining copper, and renewed activity is reported along the copper belt of California. Inertia is one of the reasons why California is not one of the great copper producing States of the Union, and it is by many considered strange that a commonwealth noted for the skill of its gold miners should be so apparently backward in the reproduction of operations which are every-day matters in other localities.

THE assertion is made with some show of authoritative statement that the Atchison, Topeka & Santa Fe Ry. Co. has absorbed the new S. F. & S. J. V. R. R. and will be an important factor in California transportation, to the extent of entering San Francisco. If so, it may be of value to the mining industry of California. The A. T. & S. F. shows some desire to advertise the resources of the regions it traverses; it does not seem afraid to confess that gold, copper, silver and lead are found in the regions through which it runs, and does not appear to seek concealment thereof. The dominant railroad corporation in California has constantly done its best or worst to hinder the mineral development of the State. Unlike the railroad companies that traverse all other mineral-bearing regions of this west half of America, the Southern Pacific Co. has always sedulously decried all attempt at advertising California's mineral resources. Should the A. T. & S. F. Co. secure entrance to central and northern California, they will

doubtless do as elsewhere—aid in advertising the mineral resources of the country from which they expect to draw support.

IN war, as in mining, methods differ. In the late hostile discussion with Spain, the U. S. naval officers were chiefly occupied in keeping U. S. vessels afloat and sending Spanish warships to the bottom of the sea. But Lieut. Hobson reversed this plan and grandly aided the United States by sinking an American vessel and now raising Spanish vessels. One is reminded of this difference in methods with the same satisfactory result on reading of a Michigan copper mining company which is "sinking" a 3900-foot shaft by beginning at the bottom and working upward to the surface, and of a "drift mine" in California that is operated through a vertical shaft, the tunnel, in this instance, "standing on end."

AT Los Angeles, Cal., the U. S. Circuit Court is asked to determine in what way petroleum lands in California can have confirmation of title. Petroleum being viewed as a mineral product, oil lands had till recently been subject to entry under the same conditions as placer claims. An attempt to have such lands considered agricultural caused this paper two years ago to go into the subject in an exhaustive way, which resulted in the passage by the Congress of the United States, on Feb. 11, '97, of an act authorizing the entry and patenting of lands containing mineral oils under the placer mining laws. The act, however, omitted to specifically assert that petroleum was a "mineral oil," and this omission is made the basis of a suit regarding title to a tract of oil land in Coalinga, Fresno Co., Cal.

ON the preceding page is outlined the latest project of most present interest to many—the proposed unwatering of the Comstock, Nev., lode, with a hope of resumption of deep mining. The proposition to use a modification of the water elevator system, combining with it the application of compressed air, is an experiment that will be viewed with interest by hydraulic engineers. It is intended that the whole machine shall not occupy more than 3x2 feet in the shaft, the height being, of course, as the height to be pumped. The apparatus is to be built in guides, and lowered in sections of 50 feet. The first lowering and pumping will be from the 90-foot mark below the Suro tunnel (the water is now 30 feet below the level of that tunnel), and when that depth is unwatered the machine then to be sunk to the 140 foot mark, and so on.

RECENTLY appeared a short editorial herein on "the chief present need of the mining world," which has been most extensively copied and commented upon, because of the suggestiveness of the topic, which is of interest to so many. It is interesting to note how different writers handle the theme, according to the standpoint from which it is viewed. So many "needs" are stated that it would be difficult to supply one-half of them with human nature and conditions as at present constituted. Idaho's leading paper says that in Idaho, and probably in every section where new properties are to be opened up, one of the chief needs is a change that will bring claim owners and investors together more readily, and that will prevent legitimate enterprise from being handicapped and headed off by the selfishness of rivals, and proceeds to read a lecture to a certain or uncertain class of men who are found in every mining community who never help but always hinder. It is certain that wholesale conversion of this class to more progressive ways would aid, but, as in numerous other comments elicited by the article referred to, while the needs stated are manifest, none of the writers point out a practical way of correcting the present untoward conditions.

IN some things the "trusts" can give points in business management to miners in showing that success depends largely upon business economy, and that a little waste here and there tends to failure. Probably no business is more perfectly systematized than that of the Standard Oil Co. It is as much their system as their monopoly that enables them to so frequently declare dividends. Nothing is too small to escape notice, and the cost sheets are scanned as carefully as though the very life of the whole business depended upon the saving of a few cents in some petty, particular instance. Recently

the manager of one of the oil refineries was notified from the headquarters of the Standard Oil Co. that he was using too much solder upon his cans. He didn't believe it. He investigated and found that what the tell-tale cost sheets had made clear to the head office was correct. The slots in the machinery feeding the solder had become enlarged and it was fact that slightly too much solder was being dropped upon the oil cans. Another time he received notice that he was using too much paint upon the heads of his oil barrels. The cost sheets had told it, and was true. Little leaks in mine and mill management often represent, if unchecked, in the course of time, the difference between success and failure as legitimate business proposition. The big dividends regularly paid to the stockholders of the Anaconda Copper Co. are largely because of the economical manner in which the ore is handled, as there is not scrap of waste.

ONE of the most prominent present characteristics of the mining world is the reopening and profitable working of mining properties once abandoned but now in many cases dividend-paying producers; this being possible because of cheaper forms of treatment, better transportation facilities, decreased cost of supplies, and a general advance in modes and methods of scientific mining. In many isolated places, where development has not as yet justified the building of a plant of its own, many a little mine would find the custom mill an important factor, a necessary adjunct, but it is not an uncommon case that the custom mill remains "nothing learned, nothing forgotten," just as a generation ago. It is not an unusual experience for a miner to send his little "mill run," hoping to get a few dollars from the clear up, with the outcome that his "dirt" just paid expenses; sometimes the result putting him in debt. Of course, no mill, custom or other kind, can put values in ore, but it is often manifest that use of the man proffered improvements would be of profit to the owner of the custom mill and of encouragement to the miner dependent on it. As matters stand to-day, with right management, the operation of a custom mill offers as profitable a field of industry as mining itself. As a business proposition, the up-to-date running of a custom mill should be a paying investment. Mention is made of the custom mill because it is an important factor in general mine development, and can be made of great value by prudent and progressive management in saving values and handling low grade ores at a mutual profit.

THE annual report of the director of the U. S. mint for '97, presumably accurate, gives first place in the world's gold yield last year to the South African Republic, which is credited with a gold production for the year of \$57,633,861, the United States a close second with \$57,363,000, Australia \$55,684,182, Russia \$23,245,763. Of the United States production, Arizona contributed \$2,895,900; California \$14,618,300; Colorado \$19,014,200; Idaho \$1,710,700; Montana \$4,374,400; Nevada \$2,976,400; Oregon \$1,353,100; South Dakota \$5,964,900; Utah \$1,726,100. The world's gold yield for the year is totaled at \$237,504,800. As compared with '96, South Africa showed an increase of \$13,854,192; Australasia \$10,502,249; the United States \$4,275,000; Russia \$1,709,790. As compared with '96, the United States showed a decreased silver production in '97, the aggregate being for '97, 58,860,000 fine oz., a decrease from the figures for '96 of 4,974,800 oz. Mexico' silver production for '97 was 53,503,180 fine oz., a decrease from that of '96 of 8,256,756 fine oz. The gold yield of Mexico for the year was \$9,436,300. This last is noticeable. When the recent appreciation of gold and depreciation of silver began, Mexican mining men at once realized the profitable nature of gold mining and their peculiarly favorable condition. Mexican legislators gave great concessions to corporations and individuals investing in gold mining, the result being a rise in the gold product of Mexico from \$1,224,621 in '93 to \$4,744,541 in '94; \$6,054,078 in '95; \$7,584,182 in '96; and nearly nine and one-half millions last year. Up to and including '94, for the ten years previous, there was in Mexico an annual average yield of \$55,000,000 silver to \$1,225,000 gold—a ratio of 44 to 1. Taking last year's figures, the ratio of production computed in ounces without reference to coinage value is about 6 to 1.

Concentrates.

A 14-INCH cube of cast iron would weigh 713.44 lbs.

The San Francisco Mint charge for recoining of gold is \$1 for 1000 c.

The world's gold yield in '92 was 7,041,822 fine ounces; in '97, 11,490,348.

In the U. S. mint one pound of copper is added to every \$2000 silver coined.

A NEW 20-mile electric line carries power to the Camp Bird mine at Imogene, Colo.

THERE are \$215,000,000 invested in the mining and transportation of Lake Superior iron ores.

CONSUMERS say that the use of cyanide in Utah during the year has increased 30 per cent.

At Idaho Springs, Colorado, there are ten mills in operation, with a daily capacity of 500 tons.

THE Grass Valley, Cal., *Telegraph* says there are about 800 men employed in the mines of that vicinity.

A "TWO-CYCLE GAS ENGINE" is one in which there is an explosion for each two cycles, or one revolution.

THE system of day's wages is reported to be gradually superseding the tribute system in the mines of Grass Valley, Cal.

THE placer gold at Home Park, Montana, is 896½ fine, and sells at \$18 58 per oz. The heaviest grains rarely exceed 750 in value.

AROUND Georgetown and Silver Plume, Colo., almost exclusively a silver producing region, over 700 men are taking out silver ore.

DYNAMOS are made that can be successfully operated under water, and can be supplied by any reputable dealer in electrical machinery.

A "WET ORE" contains a high percentage of lead or copper; ores carrying less than 5% of either of these metals are termed "dry."

If a thing is not patented all men have a right to make and sell it, to the use of its name, and to every word in the language to aptly describe it.

THE Black Hills *Mining Review* says that with a 10-stamp mill at the Holy Terror, Keystone, S. D., the cleanup of a recent seven days' run was \$42,000.

ON the Fillmore electric street railway line in San Francisco, Cal., for some blocks the grade is 25%, believed to be the steepest of any in the country.

At Keswick, Cal., the ore is an unusually pure iron sulphide, about 5% silica, and runs about \$5.50 per ton in gold and silver, with about 5½% copper.

AN authority on seismic disturbance says that thirty miles below the earth's surface is the greatest depth at which earthquakes are known to originate.

"I HAVE been reading my neighbor's copy, but your paper is a necessity to me," writes a Montana mine superintendent in sending a year's subscription.

ORE rich in copper, silver and gold is reported found abundantly outcropping on the Umatilla claim near Keller, Wash., on the south half of the Colville reservation.

At Alta, Utah, for the first time in ten years, the tonnage output and general prospects justify keeping open the road between the mines and smelters all winter.

TO GET the ratio of expansion in any engine, divide the length of the stroke in inches by the distance from the beginning of the stroke up to the point of cutoff.

ORDINARILY, in the London Mining Stock Exchange when application is made to quote a mine, one-fourth of the total capital must be represented in pounds sterling.

IN the Agatha mine, Gunnison county, Colo., was recently found the first wire gold discovered in that county. The gangue is spar, copper stained, and carries both gold and silver wire.

CALIFORNIA is rich in iron ore. In Fresno Co. are deposits which according to analysis "is unexcelled in quality by any iron mine on the continent." No effort is made to utilize it.

THE Metallic Extraction Works at Florence, Colo., recently bought the dump of the Legal Tender mine, Cripple Creek district, estimated to contain 45,000 tons that is expected to run \$8 a ton.

WHILE clearing away the debris after a blast in the 400 level of the Larkin mine at Diamond Springs, Cal., last week, J. Thompson was killed by a mass of rock falling from the roof of the drift.

THE Mountain Copper Co. at Keswick, Cal., which consumes considerable fuel, has been importing English coke. Last week it secured 15,000 cords wood, floated seventy-five miles down the Pit and Sacramento rivers.

THE brittleness or "crumbly" quality of gold noted by a Colorado correspondent is doubtless occasioned by the presence of tellurium, which in even very small quantity imparts to the ordinarily ductile metal the brittleness of glass.

THE only white metal more valuable than gold known to "Concentrates" is iridosmine, a natural alloy of iridium, osmium, rhodium, platinum and ruthenium. It is found in minute quantities on the shores of California and Oregon.

IN Clear Creek county, Colorado, though there is more gold produced each successive year, the chief product is silver. The mineral output last year was \$782,648.88 in gold, \$860,500.76 in silver, \$54,183.57 in copper, and \$177,893.32 in lead.

THREE years ago the Temple Bar, Arizona, Co. put in considerable machinery which upon trial proved of inadequate power. They kept on working and experimenting, and last week began work washing gravel by direct pressure successfully.

THIS is the nineteen hundred and ninety-ninth issue of this paper. With few exceptions a copy of any issue since January, 1869, can be furnished. All copies before that date are out of print. A complete file of this journal is now valued at a high figure.

NEXT to northern California it is thought that the beach sands at the mouth of the Coquille river, southwestern Oregon, furnish the most likely source of platinum. Samples submitted from there some time ago yielded two ounces platinum to the ton of sand.

A WASHINGTON, D. C., dispatch states that the Mineral Land office records show that there was an increase of nearly 4000 mineral entries during the fiscal year 1898, as compared

with 1897—an indication of the revival in the mining industry. In 1895 but 757 entries were made.

WITHOUT reference to the date of location, application for U. S. patent to a mining claim may be made whenever the applicant can file with the register the certificate of the U. S. surveyor-general that labor or improvement to the amount of \$500 has been put on the claim.

IN Gilpin county, Colorado, though the smallest county in the State, 50,000 tons of ore are crushed a month. The county contains 2500 patented claims. The mineral output of the county in 1897 was: Gold, \$2,086,471.14; silver, \$223,339.74; copper, \$106,952.48; lead, \$67,860.19, a total of \$2,434,623.55.

A "SLUICE-HEAD" is an Australian hydraulic miner's term, and, according to the by-laws of the different districts, represents a quantity of water varying from 19 to 274 cubic feet of water per minute, or from 171,000 to 2,466,000 gallons per twenty-four hours. (An English gallon contains 277.274 cubic inches.)

DESPITE delinquency of co-owners, a part owner in an unpatented mining claim may institute proceedings for patent in the joint name of himself and co-owners without the latter's consent. Patent will not be granted for part interest in a claim, nor can a co-owner be legally compelled to join in an application.

A loss of gold occurs in all placer mining. In hydraulic mining, where the gold is fine, such loss has been estimated at 40%. It has been figured of the total gold product of the California hydraulic mines 60% per cent remains buried in the tailings, and that of this 50% is recoverable, equal to 30% of the original contents.

IN connection with the pumping plant to be operated on the Comstock, Nev., lode, the local water company has offered to supply the necessary water to operate the pumps for \$2000 per month for six months, and renew the contract for another six months if the conditions of the mine do not improve. The water company figures that such supply will cost it \$2300 per month.

ACCORDING to the *Matabele Times*, regarding the prices of mining machinery and its erection in Rhodesia, South Africa, landed in Bulawayo, a 10-stamp mill would cost complete \$7000; a stationary engine and boiler, \$4000; crusher, four tons per hour capacity, \$750, etc. The *Times* says that a 10-stamp mill, with all requisite accessories, can be bought and erected for \$25,000.

"ORE IN SIGHT" may be defined as that contained in blocked portions of the deposit, each of which is so clearly exposed by sections on several sides that the limits, continuity and value of its contents may be determined and relied upon with reasonable certainty. Such ore so exposed may be considered a proved resource, ready for extraction and susceptible of expression in terms of net profit.

IN Dec., '97, the Australian minister of mines offered a premium of \$5000 for the best system of ventilating mines. In March, '98, a Rand, South Africa, and United States competitor were notified that they were both adjudged of sufficient worth to have the premium divided between them, which appears to have been mutually agreed to, but, to date, none of the conditions seem to have been complied with.

IN the Bendigo district, Australia, eighteen mines have found payable gold at a depth of over 1800 feet; the Shenandoah mine is working at a depth of 2756 feet, and Lansell's 180 at a depth of 3169 feet, both on payable gold at those depths. In the Ararat district gold is found in the Magdala Co.'s mines at Stawell at a depth of 2486 feet; at Charters Towers, Queensland, where a reef carrying gold was cut, at 2202 feet.

"THE National Ore Reduction Co. of St. Louis" is announced as "contemplating the erection of smelting works in Nevada City, Cal., and the intention is for each mine requiring it to have a smelter of its own." If the firm mentioned is one of the protean shapes assumed by the notorious Hartzfeldt, it would be in order to subject its claims and contracts to rigid scrutiny before acceptance in Nevada county or anywhere else.

SEVERAL years ago Dr. Warner, the Buffalo, N. Y., patent medicine man, bought the Hillside mine, Arizona, for \$450,000. After making payments amounting to \$200,000 he failed. Meanwhile he had organized a stock company and sold stock. Suit was brought by purchasers of stock to compel reimbursement. One year ago they got judgment. Defendants moved for a new trial which last week was granted by Chief Justice Street of Arizona.

CRUSHING to 30 or 40 mesh rarely gives as high a percentage of extraction (by simple amalgamation) as crushing to 50 or 60 mesh, but the size to which free-milling gold ore should be crushed to yield the most profit is a matter for individual determination. It is more a question of profit than a close saving or high percentage of yield of possible values. It sometimes occurs that there is more actual resultant net profit in saving 85% of the gold in the ore than there would be a finer system that would save 95%.

THERE is always keen but good-natured rivalry among progressive miners. In last week's "Concentrates" it was noted that the Allison Ranch mine, Grass Valley, Cal., was equipped with the combined powers of steam, electricity and water, so arranged that either system could be used separately. The manager of the Banner mine, Oroville, Cal., notes that he is now installing a water power system, and by Jan. 1st, '99, proposes to be in a position to use steam, electricity, water or compressed air for any part of that mine's plant.

COMPLAINT is made of a mine superintendent who refused to admit visitors. Ten to one he was right. Visitors to a mine are very often a nuisance. They are usually a source of worry and apprehension to everyone around the mine (except themselves) while underground, and rarely realize their real danger or the trouble they occasion. Probably, in the case cited, the superintendent might have been more courteous, but it is equally probable that he saved the visitors from unpleasant experience. "No admittance except on business" is an excellent notice for the entrance to a metal mine.

NOTHING has caused more current comment than the recent statement herein by Wm. Orr, of Salt Lake, Utah, that at a Mercur, Utah, mine silver was being produced at a cost of 23 cents per oz. Immediately upon the receipt of the statement effort was made to secure data and detail regarding such extraordinary production, but so far with no result. The political and commercial importance of the assertion is manifest, and while with the former this paper has nothing to do, the fact that so many of the most pro-

ductive silver mines in the United States are now closed because of inability to make expenses at the current rate of silver lends unusual interest to a direct assertion that in any locality silver can be produced at anything like the price stated. The mine designated by Prof. Orr in his communication of the 11th inst. is the Chloride Point, Mercur, Utah, of which Mr. Gill S. Peyton is manager.

THE Federal Government has reserved large areas of land in the southern portions of California, but for forest purposes not a single acre has been protected north of San Francisco. J. M. Gleaves, the United States Surveyor-General, furnishes the following list of Federal timber reservations in California, all of which it will be noted, are south of San Francisco: San Gabriel, 573,048 acres; Sierra Forest, 4,079,360 acres; San Bernardino, 731,179 acres; Arabuco Canyon, 49,750 acres; San Jacinto, 664,678 acres; Stanislaus, 705,340 acres; Pine Mountain, 1,735,083 acres. The total area thus reserved aggregates 8,538,445 acres.

THE mines of Laurium, Greece, now worked for zinc, lead and iron, are the same mines from which Themistocles drew the silver supply to fit out his fleet and drive back the Persian invader at Salamis (490-480 B. C.) and so lay the foundations of the Athenian hegemony. It is thought that the Phœnicians delved there before the Greeks came; so that the mining industry at Laurium may boast an origin as remote as thirty centuries back, while in full blast to-day. In walking through the French company's great mine at Camerata, in the heart of the Laurium region, one traverses a gallery in active exploitation for zinc and lead close by another worked by the old Greeks two or three thousand years ago. For such a "transient industry," mining seems to evince some permanent characteristics.

WHEN a British Columbia miner's license inadvertently expires, he should post in the office of the mining recorder a notice of intention to apply for renewal, and forward to the minister of mines a statement of the facts in the case, accompanied by a fee of \$5. The minister of mines thereupon issues a new certificate dated back to the time that the first certificate expired. If, between the time that the first certificate expired and the time that notice of intention to apply for relief is posted, any of the applicant's property has been relocated, no remedy is possible. But relocations of the applicant's ground made by others after he has posted his notice of intent to apply for relief are not valid. If assessment work is done on a claim within the year, and the work is not recorded during such period because of oversight or otherwise, the holders of such property are allowed a further extension of seventy days in which to record the work, provided a fee of \$10 is paid. This thirty-day extension is not allowed in which to do the work, but simply to record, and the work must be done within the year as provided in the section before amended.

EUROPEAN metallurgical works essay the saving and utilization of the gas and vapors emitted by the smokestacks, and in place of vitiating the air and injuring vegetation it has become a special science to obviate these evils and derive a profit from them. The question of utilizing such waste gas was recently discussed at the international chemical congress by A. Harp, who stated that the direct neutralization of furnace gases by means of lime, magnesia and other similar bodies was seldom possible. When, however, the percentage of sulphuric acid in the gas would rise above four, the gas would be serviceable for the manufacture of sulphuric acid, or, still better, for the production of the sulphate as used in the preparation of the wood pulps of the paper industry. This sulphate is recovered by liquefying the sulphur dioxide in the gas, which process is now being introduced in the Silesian zinc works by Haenisch & Schroeder. Or, as practiced at the works of Porak Bros., Kienberg, Bohemia, the gas is enriched, if necessary, by burning sulphur in it, cooled, and conducted through lead pipes to a water injector, which carries the gas down to a tank 20 feet below. A centrifugal pump raises the liquid again up to the injector, until the pressure of the gas and air above the water, which can absorb only a certain proportion of SO₂, forces the gas from the tank over into a system of vats filled with milk of lime and provided with stirrers. As the lime dissolves as calcium sulphite, the liquid becomes clearer. The lye, an acid sulphite, is finally drawn off, ready for use.

THE Oregon Legislature, which adjourned on the 15th inst., passed a new mining law, and repealed part of a former State law. There is no change in the required manner of locating placer claims. Regarding quartz claims it requires posting preliminary notice of location upon the vein or lode and record of the same within thirty days from date of posting. Within ninety days from date of posting, the locator must sink a discovery shaft upon the lode or vein at least 10 feet deep. A cut, or crosscut, or tunnel, which cuts the lode at a depth of 10 feet, or an open cut at least 6 feet deep, 4 feet wide and 10 feet in length, along the lode from the point where the same may be in any manner discovered, is equivalent to such discovery shaft. Such work shall not be deemed a part of the assessment work required by the Revised Statutes of the United States. Corners and center ends must be marked by stakes or mounds. Abandoned locations, when relocated, must be taken as original. Former work avails nothing. Every locator of a claim shall have a legal estate therein, thus enabling the locator to maintain ejectment proceedings, which could not be done hitherto. It also declares such claim to be real estate, and makes all transfers and mortgages of either quartz or placer claims subject to existing provisions relating to recording, foreclosure, redemption, etc. The time for redemption under this law, of a claim sold under execution, is limited to sixty days on the part of the judgment debtor. Ditches and flumes are declared real estate, and five years' nonuse, instead of ten, as heretofore, forfeits title and makes the same subject to a new appropriation. The bill provides that the redeemer must pay not only such sum as is now required by the general law relating to redemption, but also such additional sums, not exceeding \$100 per claim, as the purchaser under execution sale, or his assigns may have expended to keep alive the possessory right, with 10 per cent interest thereon from date of such expenditure. It then declares that any and all grubstake contracts shall be null and void unless reduced to writing, with the names of the parties thereto and the duration thereof, and placed on record; that all locations of quartz claims after December 31, 1898, that do not comply with the provisions of the act shall be null and void. Under the former law, recorders of conveyances were not required to pay over to the county treasurers moneys paid for the recording of mining claims.

Loss of Gold in Cyaniding by Volatilization.

Written for the MINING AND SCIENTIFIC PRESS by
MATT. W. ALDERSON.

"Did you ever run an ore containing good values where you made a good extraction—left little in your tailings—and yet failed to have your gold in solution?"

Such a question I have put to experienced cyanid-ers. They have looked at me as if they wondered if cyaniding was beginning to have such an effect on me as sheep herding is said to have on its follow-ers, and have then told me that such a thing was impossible; that if I took the gold from the ore I should certainly have it in my solutions; that if it was not extracted it should show in the tailings. That's what I thought till the logic of events com-pelled me to conclude otherwise.

In the writings of workers in cyaniding loss of gold from various causes is accounted for; but, so far as I am aware, no reference is made to volatiliza-tion. What may be considered the nearest reference to loss is from an opposite cause—reprecipitation. Park, in his excellent work on "The Cyanide Pro-cess" (p. 113), says: "In cases where ores contain considerable proportions of metallic sulphides, solu-ble in cyanide solutions, sufficient alkaline sulphide may be formed to precipitate a portion of the dis-solved gold." A later writer, Wm. Orr, in his ad-dress before the International Mining Congress at Salt Lake City (see MINING AND SCIENTIFIC PRESS, July 23, 1898) ascribes reprecipitation to the pres-ence of carbon in the ore, and says: "I have taken a solution assaying \$11.60 per ton and after circu-lating it through some of this base pulverized ore for twenty-six hours found it then assayed only \$9.20."

At the starting of a new plant, early in 1898, I was brought face to face with the fact that the first cleanup did not begin to correspond in value with that shown by assays. In tracing back to discover the cause, it was found that such gold as could be obtained in solution was dissolved in a very short time. In one hour assays showed \$13.60 in solution, in two hours \$12.80, three hours \$12.30, four hours \$11.60, and so on, until in eighteen hours there was not in solution more than about 50 per cent of the amount there was shortly after the treatment of the charge had commenced. Treatment was arranged to use the smallest amount of cyanide consistent with good work, careful check was kept on the sul-phides, and when they became quite prominent in the solution it was discharged and work was com-menced over again with fresh solution. The theory advanced by Mr. Orr is a plausible one. It is a known fact that carbon is a precipitant and its pres-ence might easily cause precipitation of the gold already in solution, but, as I conceive, only when the solution would be in contact with the ore. At one time, when agitating a charge of tailings hauled from a yard where there were burned trees, I noticed a large quantity of charcoal floating on the surface of the vat. Carefully removing all but a few pieces of the charcoal, those pieces were left till close of agitation and then assayed. They were found to assay over \$500 to the ton. This, I take it, would be called reprecipitation. But the difficulty of which I speak has caused losses of many thousands of dol-lars when the most rigid tests have failed to show reprecipitation—when there was no great quantity of sulphides present; when there was no carbon-aceous substance in the ore; when, in fact, the solu-tion was not in contact with the ore. In reprecipi-tation certainly the escaping values can be found somewhere. If reprecipitation occurs in the leaching vat, then the tailings should run high accordingly. If reprecipitation takes place in the gold vat, then there should be some values in the sides or on the bottom of this vat. In the instances of which I speak nothing of the kind happens, and every proof points to the opposite of reprecipitation, viz., vola-tilization.

In my experience in treating slimes it was contin-uously apparent that an adaptation could easily be made so that the process of amalgamation and cy-aniding would be continuous, and no handling of the ore be necessary after it once reached the mill. I know that Almarin B. Paul introduced the flowing of cyanide solution through the battery at the Calu-met Co.'s mill, and said, "This plan has been in operation over four months, with no discouraging features" (MINING AND SCIENTIFIC PRESS, July 2, 1892). There was no record that this mill continued working in this way for very many months, and no one else seemed to be combining cyaniding with bat-tery crushing, though it naturally presented many favorable features. That, to me, was easily ac-counted for, for slimes were not being handled, and, as nearly everyone used a strong solution of cy-anide, hesitancy would naturally follow in regard to using such a large amount of such strong cyanide-bearing fluid as would be necessary. With the use of milder solutions, the idea of crushing direct in cyanide solution seemed to make more and more of an impression upon cyaniders in different parts of the world. Referring to the fact that in South Af-rica, where water is scarce, the battery water is settled and used over again, a recent writer (W.

Leonard Holms in *Engineering Magazine*, July, 1898) says: "It is conceivable that, through this innova-tion, a radical change may be effected in ordinary milling practice by the substitution of a weak solu-tion of cyanide for water in the mortar boxes. There is apparently no reason why this should not be done advantageously. The quantity of solution in circulation would not amount to more than five or six tons per stamp; there would be no chance for loss of liquor beyond that entailed by causes at pres-ent in operation; a considerable proportion of the fine gold of the slimes would be dissolved with great rapidity in the mortar boxes, owing to the free ac-cess of air to the latter and the intimate contact of each particle with the solution; and, lastly, the solu-tion at the sands cyanide works would not be diluted, as at present, by the water delivered with the tailings. If it were found that the gold was effectively dissolved before the slimes reached the slimes works, the latter could be curtailed in size, as only settling and washing would be necessary in the way of treatment prior to precipitation of the liquor."

Entertaining similar ideas, I naturally sought to so shape my work that when I should make a change from tailings treatment to ore it would be gradual and easy. Larger and larger quantities of solution were used with the charges of tailings, more nearly approaching the quantity of solution which would naturally be expected to be used in treating ore, which, according to authorities and experience, would range from seven to ten tons of fluid to each ton of ore. Assays on this work were always satis-factory, but some of the cleanups were not so good as on the same class of material treated previously. But it was never suspected that the proportion of fluid used had anything to do with producing such a result.

At length the time came when I was satisfied there was no difficulty whatever in the way of direct treat-ment. Securing a lot of ore which usually milled about 60 per cent and the tailings from which I knew from experience could be treated to perfection, I made a run. The assays showed good work was be-ing done, but the cleanup was several hundred dol-lars short of what it should have been. I called in a skilled assistant to go over my work, and we both traced the shortage direct to the battery. More ore was obtained and it so happened that it contained a considerable proportion of quite coarse gold. The result of this run was not so bad—in fact, it was so encouraging that two mills where I had been treat-ing tailings were put at work on ore. Most of the ore used in these runs was such as laboratory tests showed could be handled quite successfully by cyanide alone, but as part of the gold could be saved by amalgamation and a better extraction secured in shorter time when only the fine gold was left for cyaniding, the combined process seemed to be the ideal one. Checks kept on both mills showed they were doing excellent work. The material treated ranged in value from \$3 to \$34 a ton, most of it being in the neighborhood of \$11 and \$12, and the tailings were lower in value than had been expected, ranging from 40 cents to \$1.60. At the end of two weeks, cleanup was made at both mills. At neither mill did the cleanup of the plates and mortar aggregate \$50 in amalgam, and the precipitates and zinc in the ex-tractors were practically valueless, much to my as-tonishment.

I have since endeavored to see if I could find the leak. I cannot say that I know, but I have an idea, though such conclusions as I have formed may be materially modified by further investigations. Based on personal observations and experiences, they have been made principally after the events, and most of these experiences being in the nature of losses one would not care to duplicate them on a working scale.

Considerable work has been done in investigating the effect of oxygen in connection with the dissolu-tion of the gold by cyanide. Not only has it been proven that gold cannot be dissolved in the absence of oxygen (Journal of Proceedings of the Chemical and Metallurgical Society of South Africa, Vol. I, p. 295), but it has also been demonstrated that greater quantity of oxygen is necessary in dissolving the gold from some classes of material than from others. Caldecott says (MINING AND SCIENTIFIC PRESS, Sept. 18, 1897): "In the treatment of most accumulated slimes, however, the gold simply does not dissolve without its application, so that, instead of merely accelerating the reaction, it becomes as necessary for their treatment as cyanide itself." Writing on this same subject, Charles Butters says (MINING AND SCIENTIFIC PRESS, April 16, 1898): "During the op-eration of dissolving the gold in old slimes, oxygen must constantly be supplied. * * * Oxygen is absorbed from the atmosphere more readily by di-lute pulp than by thick pulp, and we have found in actual practice that the gold in a thin pulp dissolves more readily than in thick. The general practice is to have about four tons of liquid to one ton of slimes for dissolving purposes, and beyond this point the thicker the pulp the longer the time for the complete solution of the gold."

In tailings treated by me where four tons of liquid were used to the ton of material, my cleanup was but \$2.25 per ton, where in previous work on the same yard my actual recovery had been \$6 per ton. The

average value of the tailings before treatment was \$7.20 per ton and assays of the residues were practi-cally the same in both instances. The quantity of re-ducing agents in the material was not great, conse-quently there would not be the demand for oxygen needed by the slimes of South Africa; but in what way could a surplus of oxygen have done harm?

Scheidel tells us (The Cyanide Process, Scheidel, p. 9): "Elsner found that gold and silver were dis-solved in potassium cyanide without decomposition of water. The dissolution of the metals is, however, the consequence of the action of oxygen, which, ab-sorbed from the air, decomposes part of the cy-anide." Christy says (MINING AND SCIENTIFIC PRESS, Jan. 9, 1897): "There is danger in using too strong an oxidizer or too much of it. * * * In the cy-anide solution the oxygen and the cyanide of potas-sium may exist side by side in solution (as experi-ment shows) without sensible action on each other, unless the presence of gold determines the Elsner re-action at the point where oxygen, water, gold and cyanide of potassium meet. If a thorough utilization of the cyanide is desired, the action of the oxidizer should be such that the cyanide will be decomposed only under the stimulus of the presence of gold. Under these circumstances the cyanogen will be uti-lized to the utmost. If, however, the oxidizer is a powerful one, capable of attacking the cyanide on its own account in the absence of gold, the inevitable consequence will be a rapid destruction of the cy-anide, just as would be the destructive effect of such oxidizers on the blood."

It will not be questioned that the cyanide solu-tion would be furnished a superabundance of oxygen in the mortar, and, according to authorities, the natural consequence would be a great consumption of cyanide. Instead of this, the reverse is true. The consumption of cyanide in the solutions passing the battery was practically nothing. The most rigid tests failed to show consumption of over one-tenth of a pound per ton on some of the ore, no matter what strength of solution was used. It was the gold that suffered; so, if an excess of oxygen was to be avoided because of its destructive effect, that effect was not brought into play on the cyanide, but on the gold.

All authorities, but one, that I have read, say that there is always a considerable loss of cyanide in the passing of the solution through the zinc extractors. I have never handled a tailing pile or an ore where I could detect any appreciable loss in cyanide from its contact with zinc, and I notice Philip Argall has had the same experience at the works of the Metallic Extraction Co., Cyanide, Colo.: (The Mineral Indus-try, Vol. VI, p. 375). He says: "It is not at all unusual to find the free cyanide higher in the solution leaving the box than on entering; still, it is not the rule. Our experience with solutions of this strength (.53%) is that there is no appreciable loss of cyanide in passing through the boxes. Sometimes the issuing solutions are higher, sometimes lower, while the average shows about the same strength of cyanide in the solutions issuing from the boxes as contained in the solutions entering them."

Now, in battery cyaniding the cyanide passes through all the stages of the process with but slight shrinkage of its strength, and does its work well, for the extraction from the ore is as nearly perfect as one could ask. But the gold goes into the mortar never to show itself again in tangible form. Whether it is decomposed by the oxygen and passes off in a gaseous form, I am not prepared to say; but I know, to my sorrow, it disappears, and I am satisfied the oxygen has something to do with it. In instances where some gold has been held in solution until it has reached the extractor, it has only done so to make its escape there. I have suspended the treating of ore and put tailings through the mill till everything was running all right and the zinc in the head com-partment of the extractor would assay several dol-lars a pound. Commencing with solutions run through the battery again, in a few days such gold as was on the zinc would be gone and the zinc and the precipi-tates would assay from 50 cents to \$1 a pound only. The gold did not pass out with the fluid, for all checks on the effluent of the extractor failed to show even a weighable trace of gold in two assay tons of the solu-tion. Christy tells us (MINING AND SCIENTIFIC PRESS, Jan. 23, 1897): "Water containing dissolved oxygen attacks metallic zinc quite vigorously, forming hy-drate of zinc." During the experiences above re-ferred to, the zinc was consumed more rapidly than usual and half the precipitate was a white substance which was first thought to be lime, but which was proven afterwards to be principally zinc.

Even alkaline sulphides are powerless against the solvent power of solutions in battery cyaniding. Among material brought to one of the mills for treatment was six tons of tailings, containing a very appreciable quantity of alkaline sulphides. On pan-ning same, it was found that they contained consid-erable free gold. So they were mixed with ore and put through the battery. They assayed \$19.60 in gold before treatment and less than \$3 a ton after-wards. The gold all seemed to be caught in the bat-tery (but it wasn't), and, if there was any value to the cyanides and zinc before, there was certainly none after the solutions from this material passed the extractor.

The class of material treated would not be called a

regular pyritic ore. In other words, such iron as it contained was not in cubical form. R. Recknagel, in an article on "Cyaniding Sulphide Gold Ores," (*The Engineering and Mining Journal*, Nov. 13, 1897), throws considerable light on the fact that, in experimenting with natural sulphides, "apparently the same material is acted upon in different degrees of intensity." He says: "The most puzzling fact to me so far has been that the natural bi-sulphide of iron FeS_2 , shows very considerable difference toward cyanide, and the mystery became scarcely more intelligible when I noticed that, quite apart from any admixtures, the kind of FeS which crystallizes in the rhombic system, the marcasite, is always attacked by cyanide to a considerable degree, whereas the isometric iron pyrites is not at all, or very little, acted upon. * * * It is, of course, plain that the substance of the dimorphous FeS_2 cannot be the same in the two different forms, a fact which might readily be implied from the different behavior of the two kinds toward the oxygen of the atmosphere. It is very well known that marcasite very rapidly oxidizes into a proto-sulphate of iron, whereas the cubic pyrite withstands the influence of the atmosphere very much longer, etc." Does not this throw light on the subject? Is it surprising that a material so hungry for oxygen in nature should act peculiarly when suddenly given enough to fairly intoxicate it?

It is not so gratifying to speak of our failures as of our successes, but is it not true that our most valuable lessons are obtained from the former? The outcome of these experiences will lead to a utilization of the forces that have done harm. With certain classes of material, the proportions requisite for good work will be ascertained, and a better extraction secured; with others the time of getting the gold in solution will be greatly expedited. Crushing in cyanide solution will not be a success with some kinds of ore where the usual quantity of fluid is employed. That is certain. On the contrary, nothing can interfere with amalgamating and direct filling, so that the process can still be continuous. I have successfully handled the same ores as those above referred to by amalgamation, as ordinarily practiced, running the pulp into the agitating vat, decanting the excess of fluid, adding the cyanide solution and proceeding as usual.

Zinc Ore in the Mine and Market.

TO THE EDITOR:—In an editorial in the issue of Oct. 8th, 1898, you mention the "impracticability" of profitably treating an ore containing 35 ozs. silver, 14% lead and 35% zinc. The impracticability of treating such an ore is not as apparent as the impossibility of marketing it; and as your Utah subscriber requested information concerning the treatment, I will state that such an ore can be profitably treated if it is of such a character that, by concentration, a separate product sufficiently free from iron and lead can be made of the zinc ore. The two products, silver-lead and zinc, can then be smelted by the usual methods.

Zinc ore, delivered at the smelter, can be roasted and smelted in Missouri for less than \$11.50 per ton. The loss in smelting varies from 10% to 25% of the metallic contents. The Missouri-Kansas smelters lose about 15% in treating ores containing from 48% to 65% zinc. As much as 8% lead is not considered detrimental to zinc ores. Most of the lead remains in the retorts either as globules of lead or is absorbed by the retorts. Lead does not alloy with zinc, and any lead that may find its way into the condensers can be separated from the zinc by refining.

The presence of iron in zinc ores affects the process of distilling by adhering to the interior of the retorts, thereby increasing their weight and lessening their capacity. Both lead and iron may accumulate in the retorts to such an extent as to cause the retorts to break on account of their increased weight.

The large percentage of loss in extracting zinc from its ores is due to the fact that, by the methods at present employed in reducing the ores, the metal must necessarily pass through the state of vapor. Zinc volatilizes at 1200° centigrade, while the oxide of zinc, the ore with which the retorts are charged, reduces at 1300° centigrade; the metal is therefore released in the form of vapor from which it is condensed. The loss in distilling is then caused by: the escape of uncondensed zinc from the condensers; absorption by the retorts; infiltration through the retorts (when new); breaking of the retorts; and unvolatilized zinc remaining in the retorts, due principally to insufficient roasting. Absorption by and infiltration through the retorts can be prevented by glazing the interior of the retorts.

Marketing zinc ores is an entirely different proposition from treating them, and one which, in your issue of Sept. 24th, 1898, "Miner" demonstrates the impracticability of when the ores are mined in the western States.

Seventy-five per cent of the zinc ore of the United States is produced in the Missouri-Kansas district, and it is estimated that the ore marketed there averages 57% zinc. The smelters which treat these ores do not care to purchase an ore that contains

less than 48% zinc and more than 3% iron. Penalties are also imposed upon lead, moisture, "sand," baryta and other extraneous matter. To be marketable an ore must therefore be concentrated to meet the above requirements.

The concentrates are purchased by the smelting companies who visit the ore bins and bid for the weekly output. The price bid depends upon the demand for ore and not upon the market price of metal, nor upon the contents of the ore. The smelting companies assay the ore in order to ascertain the limit to which they can bid, and put the price as far below the limit as possible. The miner can assay his ore if he wishes, but he prefers not to know how much he must lose. The cost of the assay would be only that much more added to his loss.

There are thousands of tons of ore in the abandoned ground, tailings piles and dumps of that district which are unmarketable on account of the high standard which the smelting companies have been able to maintain. As long as these conditions continue to exist the zinc ores of Colorado and other western States will not be in great demand.

Aspen, Colo., Oct. 14th, '98.

METALLURGIST.

The Country of the Klondike.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by RUSSELL L. DUNN.

A placer may be mathematically defined as a function of three variables or the product of three factors. The first of the variables or factors is the existence of auriferous rock in place, or gold-bearing lodes, exposed on the land surface of the earth so as to be possible of sub-aerial denudation. The second is the existence of a sub-aerial eroding force, typically flowing water in a stream channel. The third is time, during which the sub-aerial force is breaking up the auriferous rocks and concentrating their gold content. Each of these is a variable between extreme limits. The auriferous rocks or lodes may be what is called very rich—that is to say, they may carry large concentrations of gold in relatively small rock volumes and may be possible of lode mining exploitation, or, on the other hand, they may carry gold scattered and disseminated in relatively enormous rock masses, so that it cannot be economically exploited in situ. A comparatively little erosion of the first could cumulate an amount of gold in a placer that could only be equalled by a many times larger erosion of auriferous rocks toward the lower limit of unit gold content. The sub-aerial eroding force is great or little, directly as the comparative products of volume of flowing water and unit velocities, the last being a function of the stream grade or fall and its volume. The third variable—time—may be a portion of one of the smallest geological time divisions, or it may be the aggregate of several of the greater geological time divisions. Any one of the three variables, taking its minimum or nearly minimum value, and a placer is impossible. Their varying ratio to each other, no one of them being zero or close to it in value, creates the placers of every degree of richness and condition. The tangible concrete fact of these phenomena, the placer, is the resultant expression of all of them combined. So different from, and even apparently independent of, or opposite to, the other phenomena I have described here as the genesis of it is the placer that naturally enough the popular ideas have evolved, that there is no relation of cause and effect in the existence of a placer, that each new discovery disproves any or all natural laws of placer genesis; that, in short, gold is where you find it. Nevertheless, the popular ideas are wrong, as, indeed, are most of the ideas of gold occurrence and mining that are popularly received as facts. That false ideas persist and with the masses prevail would seem to be a consequence of the twilight mystery that the hopes and aspirations of men ever envelop the winning of gold from the earth. To the individual not on the ground the fact that men in the Klondike knowing nothing of mining as a business have gathered sudden fortune, while many experienced men have missed it, it appears that knowledge of placer mining is a disqualification of success, and that the wildest stories of golden treasure are the truest. On the ground it is different. The possible areas of placers are so small that the existence of gold, even suspected, in the race to secure the ground, he who comes, whether he will or no, has no opportunity to test or choose, but must claim first what is not taken before him and, after taking, test and prove. The getting a claim at all was a matter of good traveling, in which all were on an equality, and in the blind grabbing naturally many men with no knowledge of mining got the placer ground, and others who had knowledge got nothing. The stories of the ten who were lucky are much published, but a discreet silence hides the stories of the ninety who got nothing.

As above stated, the Klondike placers are of the common type, auriferous stream beds of stream erosion. Their development has demonstrated the substantial accuracy of a description of their probable extent and character given in a paper prepared by the writer and published in the MINING AND SCIENTIFIC

PRESS of August 7th, '97. Of the entire extent of the stream valleys only a fraction has been found to be certainly placer. There is a sharp disappearance of gold values at the upstream end, a gradual tailing out at the downstream end. Some of the tributary gulches have been found to be gold bearing, others have been found to contain no gold at all. "Bench" claims, so called, have been found on the whole rather richer in gold than the stream valley placers. They are "old channel" cuts described in the paper referred to, and logically should be anticipated to be richer than the existing bottom cut. I am advised that gold has in Quartz creek only been found in the "old channel" cuts, and not at all in present bottom cut. The "old channels" and the bottom channel that is auriferous have been found to be sharper in grade and more direct in course than the present flowing stream. A section of the placers nearer the upstream than the downstream end has been found the richest. The evidence that the placers are undisturbed pre-glacial deposits is conclusive. The upstream ends of the placers have a definable relation between themselves. All of these general statements have been substantially verified during the year past since their publication. In the matter of the genesis of these placers, they are, I consider, most largely of Neocene origin. The large deposits from which the placers are formed may be of Paleozoic age, or possibly as late as the Jurassic, in the latter event corresponding in age with the lodes of the Alsek and coast regions. In either event, though the formations have been part of the land surface of the earth since Paleozoic times, I am inclined to the opinion that until the Neocene period the regional elevation was such that there was comparatively little sub-aerial erosion. I am also of the opinion that there has been no alteration in the orographic movement, that it has been persistently "uplift," and that its present condition represents its maximum uplift. I am advised that the watershed summits within which the auriferous stream beds lie are not more than 1500 feet higher than the corresponding stream bed points. Whatever this difference is, more or less, it is approximately the maximum depth of erosion of the country. Very probably it is more than the depth of the erosion of the lode sources of the gold. The relation of the placers to each other is such, and the concentration of gold values close to the upstream ends of the placers and in the higher placers is such, that I am of the opinion that the lode gold values are concentrated rather than disseminated. Two of the variable factors that make the placer are proximately known directly, the time period of erosion and the erosive energy, which are expressed together by the depth and extent of erosion. The lodes have not been found yet, but given the richness of the placers, the resultant of the three factors, and the extent of the erosion, which is the product of two of the factors, the third factor is proximately determinable as a lode system of not only concentrated gold values, but rich gold values. From all the descriptions of the topography of the country and the placers that I have, I can see no reason to anticipate failure as the conclusion of the search for them.

The placer development made will not make a permanent industry. While the present methods and appliances of working are wasteful and extravagant in cost beyond all reason, another season should see modifications and changes which would admit of the working of much lower grades of the deposits. Still, even the last will be worked out rapidly. I see no reason to anticipate over five years' life to the placers now known or such as may be yet discovered adjacent. The deposits are too shallow and superficial to last against the furious energy with which they are worked. If the district is to have a future it will have to be based on the lode sources of the gold that are as yet undiscovered.

[Since the preceding was written the report of an auriferous quartz discovery in the Klondike has been made. The lode is reported to be rich in free, visible gold, 16 feet wide at the point of discovery, rotten, honeycomb in character and carrying galena and other pyritic minerals. The location of the discovery is at the head of Lombard creek, the first tributary of Dominion creek towards McQueston, and almost on the trail leading to the latter place. It is well up on the dome or divide between Dominion and Hunker creeks. Its discovery is a confirmation of the statement made a year since that such lodes would be found the source of the gold at the upstream end of the placers. In its general description it corresponds to the purely deductive description arrived at from the consideration of the phenomena of the placers which I have made in this paper.]

What has generally been referred to as "Shorty Creek District" is in the singular isolated mountain mass of metamorphic Jurassic slates lying west of Lake Deser-Dee-Ash, 150 miles inland from Pyramid harbor and accessible by the Dalton trail. Lying far off the natural routes to the Klondike district, it is comparatively little known and explored. Shorty creek itself is a small, torrential gulch tributary to a larger stream known as Khasha river. It is in the latter and one of its branches above Shorty creek, known as Alder creek, that the known placers exist. Shorty creek, though gold bearing and the locus of the first discovery, does not seem to contain com-

mercial values. Khasha river and Alder creek are torrential streams with considerable waterflow. The stream bed for several miles is auriferous and there are fragments of an older gravel-filled channel at a higher elevation which is also gold bearing. The source of the placer gold has already been traced to lodes. Khasha river is the most easterly stream in the mountain; westward from it are several other streams in which discoveries of placers and lodes were made too late this season to admit of prospecting. The district lies above 2700 feet in elevation and is reached from the coast over passes that have summit elevations of 4300 feet. The difficulty of transportation is a serious drawback to the development of a mining industry in this country. There is no water route possible and nothing apparently to justify the construction of a railroad. Probably the cheapest and preferable inlet to this district will be to take the White Pass railroad and Lewis river to McCormack's Post near the mouth of the Nordenskiöld river, thence there is a good trail up the valley of the Nordenskiöld and from it over an easy pass into the Alsek basin, twenty-five miles south of Lake Deser-Dee-Ash. The snow is off of this trail five weeks earlier in the spring than it is off of the direct coast trail; there are no rivers to cross and no ranges to climb. A good wagon road could be constructed over this route at a small cost, which would likely be justified by the mining in the district. A wagon road from Pyramid harbor would be so costly as to be commercially inexpedient. The district is on the whole not one to which prospectors can go expecting to make a strike in the first season nor even to anticipate very rich mines in. Miners, however, can make fair wages from many claims; incidentally they may discover something worth the attention of capital.

(To be Continued.)

The "Miner's Inch."

In the issue of July 30, '98, in answer to the question "What is a miner's inch of water?" was given a page of illustration, and tabulated statement in which, for the hundredth time, was pointed out the well-known fact that while exact data and results could be given where an exact constant was used, the term "miner's inch" was not an exact, fixed, definite term either in California or other States or Territories, as different water companies and different localities recognized and used different heads above the center of the aperture, the "inch" thus varying from 1.36 to 1.73 cubic feet per minute. With this was given a way of measuring a "miner's inch," in a clear and exhaustive way. The general recognition of its value is exemplified by the fact that in less than thirty days the entire edition containing the article was exhausted, and orders for that number ceased being filled Aug. 25.

Several criticisms have been received, mostly from California mining engineers, and of these some are adverse. One California hydraulic mining engineer of recognized ability deems the time propitious for some settled, definite meaning to be attached to that form of measurement of water, so far as California is concerned, and proposes that the Code Commission which is now compiling and revising the California laws, amend the present description so as to meet what appears to be the general requirements in that direction. He says:

"As usually described, 'a miner's inch of water is that quantity of water which will pass through an orifice 1 inch square in the side of a vessel under a mean pressure of 6 inches.'

"In appropriations of water under Sec. 1415, paragraph 1, of the Civil Code, it reads: 'that he claims the water there flowing to the extent of (giving the number) inches, measured under a four-inch pressure.'

"I would suggest that the Code Commission amend the above paragraph by inserting the word 'mean' after the words 'four-inch' and before the word 'pressure,' so that it would read 'four-inch mean pressure.'

"This is essential, because the size of the orifice is not named in the Code, and the actual or mean pressure is left in doubt. Should the pressure or overflow board remain the same, the deeper the orifice or throat, the greater the amount of water for each miner's inch flowing through it.

"The accompanying two figures illustrate my meaning. In Fig. 1 the 4-inch pressure board remains the same:

With a 1-inch throat or orifice the mean pressure is $4\frac{1}{2}$ inches.
 " 2-inch " " " " 5 " "
 " 4-inch " " " " 6 " "
 " 6-inch " " " " 7 " "
 " 8-inch " " " " 8 " "

"Now, referring to Fig. 2, you will see that the pressure, or 4-inch mean pressure, always remains the same, and that the depth of the pressure board varies according to the size of the throat:

The 1-inch throat requires a $3\frac{1}{4}$ -inch pressure board.
 " 2-inch " " 3-inch " "
 " 4-inch " " 2-inch " "
 " 6-inch " " 1-inch " "
 " 8-inch depth " " no " "

"It is understood, of course, that the 4-inch throat means four miner's inches, the 2-inch throat two

miner's inches for each inch measured horizontally, and so on.

"In Fig. 1, the pressure being greater, each inch of the wider throats means a greater quantity of water proportionately to the size of the throat. Hence when ditch men contract for the sale of water they always specify that the measurement shall be under such and such mean pressure.

"By inserting the word 'mean' it leaves nobody in doubt as to what is meant exactly."

The Code does not define a legal inch of water, merely stating that water (so many inches) may be

turn, there will be a support sufficient to put the proposition through.

In his treatise, Mr. Paul deals with the old lode from its beginning, through its palmiest days, when I, as a boy, roamed among these barren mountains, to the very time when work was finally abandoned. He realizes the cause of this abandonment and probably remembers when the best engineering skill of the time was exerted to its utmost to further development, and when finally, through lack of financial support, all succumbed to the rushing floods. All that existed at this time was the very best obtain-

able; but as I, then a boy, have grown to manhood, just so has the engineering profession advanced and through its modern appliances has again placed the old lode within the bounds of a paying proposition.

To-day, in the "gigantic combination" of which Mr. Paul writes, each one of the twenty-seven companies on the Comstock, from Cedar Hill on the north to and including the Justice on the south, stands ready to give to this enterprise its entire moral and financial support. The condition of these properties at the time work was suspended has been thoroughly investigated, and, upon the recommendation of the various superintendents, the "Pumping Association" is ready to carry the work to a successful conclusion.

It is a fact that even now the same problem of drainage that was instrumental in the

FIG. 1.
Pressure-board of 4" remaining constant, but throat and mean pressure varying.

FIG. 2.
Mean-pressure of 4" remaining constant, but pressure-board and throat varying.

appropriated under 4-inch pressure. In the above the four inch mean pressure is not specially advocated, it being simply suggested as being the least change for the Code Commission to make, and less likely to provoke discussion in the Legislature when the report comes up for adoption. Probably were the professional preferences of hydraulic engineers consulted, many of them would favor an inch that is, approximately, about six and one-half mean pressure, as that would give 100 cubic feet of water per hour, which would render it capable of definite comparison for motors, etc.

The Comstock Proposition.

TO THE EDITOR:—In the issue of Oct. 8th is an article by Almarin B. Paul, in which he, from a financial standpoint, doubts the advisability of a resumption of deep mining on the Comstock and in which he further takes the ground that the same amount of money could be expended to a much better advantage upon other "undeveloped Comstocks," believed to exist in Nevada, and, lastly, he confronts us with the all-important question, "Will it pay?"

Granted that there are other Comstocks awaiting development, and also that this great belt comprises but one-tenth part of the mineral resources of the State of Nevada, I still fail to see the old lode in the light of a "has been," and from a scientific mining standpoint, when work is resumed upon a modern business basis, this great enterprise will furnish food for the multitude for a long period of time, and will prove a legitimate paying investment.

By a resumption of work in the deeper levels I do not mean that we can again take up the old and wasteful methods employed at the time these workings were abandoned and continue the development along lines which Mr. Paul rightly styles "the curse of the entire mining industry." New ways and means must be adopted and the old ones abandoned; then with the advent of modern engineering, modern machinery and modern mining methods, it can be made to pay.

Before such an enterprise can be placed in the category of legitimate investments, the element of stock deal, pure and simple, must be eliminated; and then, with the moneyed interests assured of a fair re-

abandonment must be confronted and overcome before work can be resumed; and were the facilities at hand simply those of former days, no reasonable thinking man would hesitate in the assertion that an attempt in this direction would be folly in the extreme. This question of drainage naturally divides itself into two separate and distinct problems, each capable of a solution distinctively its own, and differing materially in magnitude.

The workings upon the Comstock have been carried out in such a manner that the Gold Hill mines are isolated from the middle and north end mines; just so is the problem of drainage and so will be its ultimate solution. During the past two years both of these problems have been thoroughly investigated, and, as a result, plans and careful estimates have been formulated for the entire work.

By the judicious use of the hydraulic equipment available in the Chollar-Potosi and Combination shaft, the work of draining the Virginia mines will be very much facilitated and a very superior showing made from the outset. Of course, this plant would not be adequate for the accomplishment of the purpose in its entirety, but is a good beginning, which will ultimately lead to the drainage of the entire Virginia group of mines.

In Gold Hill the plan as outlined is upon a different basis, is a radical departure from older methods; and is a definite proposition which will lead to a definite result and will, without intermediate steps, accomplish the work of draining the entire south end in a surprisingly short space of time.

The estimates upon this plant have been a revelation to even the most sanguine, inasmuch as the cost is comparatively small, much less in fact than was anticipated, and the actual operating expense, including interest, insurance, taxes and depreciation, about \$3 per horse power (\$4800 per month), as against the enormous figure (\$54,400 per month) formerly paid for an equivalent pump horse power. This fact alone, to my mind, is quite sufficient to warrant a resumption of work in all of these properties, to say nothing of the many other advantages afforded through the extensive use of water power, electrically transmitted. So, after a more thorough investigation of recent developments and the plans as at present outlined, I believe that Mr. Paul will also agree that this enterprise will not only pay, but should be carried to an early conclusion.

Oakland, Cal., Oct. 22nd, '98. LEON M. HALL.

Coast Industrial Notes.

Shipments of oil from the Coalinga, Cal., last average 1000 barrels a day.

The Utah & Pacific road from Milford, has finished seven miles westward.

A new railroad from Perris to Lake View, seven miles long, is to be in operation November 1.

The Sunset mine, near Cumberland, has been bought by the Co-operative Syndicate, for \$30,000. It has four of bituminous coal.

The Pacific States Telephone Co. is the title of the consolidated companies with the line extending from Portland to San Diego, longest in the world.

English engineers are surveying for a road from Batopilas, Sonora, Mexico. It is expected that the new line will have its terminus at Topolobampo on the Gulf of California.

In the bids for extending the north and south jetties at Yaquina Bay, Or., Christie & Heyworth of Chicago are the lowest bidders—\$511,940. There were eight other bidders ranging from \$669,000 to \$847,688.

The proposed extensions of the Mexican railroad, the plans of which are before the department for approval, comprise a line from Durango to Guanacevi and one from Toluca to Guadalajara.

The buildings for the new naval station located on Yerba Buena Island, San Francisco bay. They will accommodate 300 officers. Congress has appropriated \$50,000 for construction.

The Atchison, Topeka & Santa Fe will be running into San Francisco from Chicago before next September, says E. P. Ripley, president of the Santa Fe at San Francisco last Tuesday.

Three carloads of lumber and machinery arrived at Johannesburg, Cal., for the California Borax Co., that is erecting works at Borax Lake. They propose to erect a plant capable of turning out 100 tons of refined borax a month.

Oil developments at Summerland, Cal., less. The Beresford & Hickey new wells are eighteen barrels per day. Experimental operations on one of the Treadwell wells resulted in a flow of eight barrels in forty-four minutes.

The railroad surveying party in southern California is supposed to be working for the Southern Pacific, laying out a new route to California. The Rio Grande Western is thought to accord with a plan to connect with its line between Richfield and Maryvale, Utah, the Great Northern Railway has 500 men working on the Cascade tunnel, in Washington, about evenly divided between the two lines. The progress made is about 2800 feet. The work is in rock; nevertheless, there is a tendency to fall and the tunnel has timbered.

At Vancouver, B. C., on the 26th, was destroyed the Hastings sawmill; 250 men are out of employment. The mill was of a daily capacity of 300 M feet. The machinery was destroyed, as well as the wharf and company mill. The owner is the Royal City Lumber Mill Co., and the loss is several hundred thousand dollars.

The Mexican government has granted a concession for a standard gauge railroad, 150 miles in length, with a large subsidy, to the Ingarran Copper Mining Co., in which the Rothschilds are interested. The railroad is planned to connect the mines with the port of Zihuatanejo, on the Pacific coast, and to be an outlet for copper production.

The Hawaiian sugar crop of 1898 is estimated at 280,000 tons; 180,000 tons shipped to New York and 100,000 tons to San Francisco. There are thirty-nine sugar corporations on the islands, with a combined capital stock of \$44,800. Four of them, representing \$13,000, are California properties; California owns 59% of sugar corporations in Hawaii.

Seven men were scalded to death on the trial trip of the torpedo boat Davis on the lower Columbia river last week. The boat was built by the Wolff & Zwicker Works, Portland, Or. The tubes in the forward end of the boiler had become dry, and nine of them burst out of the steam drum. The boat was making twenty-eight miles an hour at the time of the accident.

The September report of the Los Angeles oil producers' trustees shows 28,236 barrels of oil sold by them during that month, more than twice the quantity sold by them during the preceding month. The quantity of storage, owned by the trustees, was at the end of that month 85,236 barrels. The average price received at the wells during September was 82.27 cents per barrel. The trustees estimate that the shortage for the month in the Los Angeles field will be 65,000 barrels.

Ed. Gunnerson of Melbourne, Australia, tells that Sound mill owners they must greatly improve their process of dressing lumber if they hope to compete with Scandinavian lumbermen of the Baltic sea for Australian trade in finished lumber products. Australia now exports 70,000,000 feet of Washington fir annually, of which Melbourne uses one-third. This, however, consists of rough lumber and heavy timbers. Australia's supply of finished lumber is shipped from Norway and Sweden.

Consul-General Goodnow writes from Shanghai: "I desire to suggest to chambers of commerce and boards of trade of the United States the desirability of keeping on file in their consulates in China, and especially in Shanghai, copies of the commercial directories of their cities. I am often appealed to for lists of firms handling specific lines. For example, a German located at Kyao-chau Bay

asked for a list of lumber firms on the Pacific coast. I have nothing from which information can be obtained. Such inquiries are frequent."

—Mr. C. A. Green, writing from Singapore, says that the trade of that city and of Hong Kong and Shanghai is growing. The cities are great distributive points in which the business is done mainly by English houses, which will not push American goods if they can sell their own. The United States has at present but a very small share in the trade. In Shanghai there are but three American firms; in Hong Kong and Singapore there are none. The merchants are only middlemen, the trade being with the natives, who will only buy what they know and have seen. The report suggests that trade can be built up.

—The net income of the Southern Pacific Co.'s Pacific system of 4985 miles of road was \$363,450 for the year ending June 30th, '98. The total passenger earnings of the Pacific system were \$13,178,314, and the total freight earnings \$28,545,750. There were 20,233,806 paying passengers carried during the year; average distance traveled, twenty-nine miles; paying freight amounted to 8,114,951 tons. The Southern California Railway Co., practically owned by the Atchison, Topeka & Santa Fe Railway Co., has a capital stock issued and outstanding of \$12,824,000, and a total of 471.14 miles of track in operation. It produced a net income of \$341,196 during the fiscal year, the gross earnings being \$2,539,717. The S. F. & S. J. Valley road, with its 277.34 miles of main line and its total length of 318 miles of track, had a net income for the year of \$128,753. The total cost of the average mile of road owned by the company is \$16,925. The Valley road employs 509 persons, at an expense of \$260,322 a year, or an average of \$2.13 a day for each person. It carried during the past fiscal year 64,595 paying passengers and 171,047 tons of paying freight.

—"Duty determines destiny," says President McKinley, thus putting in three words the most sublime sentiment of the century. As duty demands the construction of the Nicaragua canal it may be considered as a matter of destiny from an American standpoint. The war with Spain has doubtless convinced all America that the Nicaragua canal will have to be constructed with all speed—no matter what may be the engineering difficulties and the financial obstacles. In defeating Spain the American Union has become a maritime nation, and by annexing Hawaii and protecting the Philippines she will become politically, as she has always been geographically, one of the powers of the Pacific. Toward the Pacific the balance of the world is now steadily setting. In that vast basin, stretching from the shores of the two American to the China seas and the Indian ocean, are brought face to face the two great races of mankind—white and yellow—each working out its own destiny. Within that great area Britain, America, Russia, France and Germany are contending for supremacy in trade, if not for advantage in territory; Japan is establishing her claim to be ranked as a world power, and China is awaiting a new birth that will revolutionize the West as well as the East; where seven empires meet in the battleground on which will be fought out the great racial struggle of the future, as well as the economic struggle for the present. Where Europe and America impinge on Asia we behold already the beginning of a series of the most interesting problems known to human history. The foremost is the commercial one, because everybody says that but for its commercial potentiality China would not be worth a foreign office dispatch. And a primal factor in the commercial problem is now in the Nicaragua canal.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

- FOR THE WEEK ENDING OCTOBER 18, 1898.
- 612,655.—DENTAL CUPSIDOR—W. N. Avery, San Jose, Cal.
- 612,644.—BASKET—J. A. Bernardi, Salem, Or.
- 612,711.—CLEANING DEVICE—J. R. Dever, Olympia, Wash.
- 612,715.—REFRIGERATOR CAR—E. T. Earl, Oakland, Cal.
- 612,722.—ELEVATOR—C. I. Hall, S. F.
- 612,725.—BRUSH CUTTER—Hastings & Scott, San Jose, Cal.
- 612,585.—FARM GATE—G. G. Kaiser, Johnson, Wash.
- 612,580.—DENTAL ENGINE—A. E. Macdonald, S. F.
- 612,777.—DREDGER—P. H. Mackie, Pasadena, Cal.
- 612,744.—ALMOND HULLER—D. & H. H. Methven, Antioch, Cal.
- 612,535.—PIPE WRENCH—R. J. Miller, Benicia, Cal.
- 612,569.—ECRASEUR—J. G. Moscrop, San Bernardino, Cal.
- 612,432.—MINER'S CANDLESTICK—A. Nissen, Shasta, Cal.
- 612,807.—WINCH—R. H. Postlethwaite, S. F.
- 612,786.—WASH BOILER—A. Rantala, Navarro, Cal.
- 612,574.—BOTTLE—P. J. Scharbach, Woodburn, Or.
- 612,439.—POTATO DIGGER—C. Schoenfeldt, Stockton, Cal.
- 612,618.—PROPELLER—G. Sintz, Seattle, Wash.
- 612,683.—POTATO PLANTER—W. Y. & P. E. Thomas, Ingleswood, Cal.
- 612,582.—WINDMILL—F. C. Thompson, Burton, Wash.
- 612,685.—HANDLE COUPLING—Thorpe & Normant, Fresno, Cal.
- 612,579.—GRADER, DITCHER, ETC.—S. W. Wible, Bakersfield, Cal.
- 612,821.—LAMP BURNER—R. J. Wilson, Seattle, Wash.
- 29,514.—DESIGN, REIN GUARD—H. Anderson, Sumner, Wash.
- 29,519.—DESIGN, CLIPPING HOLDER—C. E. Schwartz, Palo Alto, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Personal.

H. KELLY becomes Supt. Badger mine, Aspen, Colo.

W. S. KEYES returned this week from a visit to Mexico.

E. RAY is Gen. Mgr. Little Johnny mine, Leadville, Colo.

B. DOWNEY, Supt. B. & B. mine, Troy, Montana, is in Spokane, Wash.

W. R. SHILLING has been appointed Supt. Red Rover mine, Acton, Cal.

CAPT. THOS. MEIN is credited with intention to return to the Rand, S. A.

B. F. HARTLEY, Supt. Montauk mine, Newcastle, Cal., is in San Francisco.

C. H. SCHUB, Mgr. Cigale mine, Mercur, Utah, has returned from Chicago, Ill.

J. B. McLAUGHLIN, a mine operator at Iron Mountain, Cal., is in San Francisco.

F. HUSBANDS, Supt. Dalmatia mine, Kelsey, Cal., has returned from San Francisco.

P. ELY, Supt. Esperanza mine, Mokelumne Hill, Cal., has returned from New York.

M. BAMBERGER succeeds J. Dern as Gen. Mgr. Geyser-Marion mine, Mercur, Utah.

N. GAILLES has been appointed Supt. Providence M. Co. in Yavapai county, Arizona.

S. R. PORTER, Supt. Balliol mine, Sutter Creek, Cal., has returned from San Francisco.

SUPR. BRENT of the Ivanhoe mine, Plymouth, Cal., has returned from San Francisco.

C. DORSELY, Supt. Brown Bear mine, Deadwood, Cal., has returned from San Francisco.

H. K. SHOCKEY, Supt. Phoenix mine, Nevada City, Cal., has returned from San Francisco.

B. HOWE, a mine operator of Sarawak, Borneo, is at Mercur, Utah, studying the cyanide process.

J. D. HEARD, managing owner Yreka, Cal., Blue Gravel M. Co., is in San Francisco from Denver, Colo.

PROF. A. VAN DER NAILLEN of San Francisco has returned from a seven months' tour through Europe.

D. KIETH and J. BAMBERGE, Salt Lake City, Utah, are at their mining properties near Bellevue, Oregon.

C. L. BLAKEMORE, Supt. Lituya Bay Placer M. Co. of Alaska, has returned to San Jose, Cal., for the winter.

DR. GEORGE S. ARMSTRONG is the new consular agent at Northport, Wash., to succeed F. R. Blochberger.

PRESTON WOODS, Gen. Mgr. Eaglebird mine, Maybert, Cal., left San Francisco this week for Chicago and Boston.

C. J. KENDALL succeeds W. D. Pinkston as Gen. Mgr. Three Stars mine, Auburn, Cal., and F. Romage becomes Supt.

W. J. SUTHERLAND, Pres. Holmes M. Co., Candelaria, Nev., is inspecting his mining properties at Grizzly Flat, Cal.

J. W. SEARLES, Mgr. of the Diamond S. and Little Chief in Bradshaw mountains, Arizona, is at present in Salt Lake City.

PRES. NEWHOUSE of the Highland Boy mine, Bingham, Utah, has returned from New York and Chicago to Salt Lake City, Utah.

O. O. HOWARD JR. of San Francisco has returned from Trinity county, Cal., where he has been examining mining properties.

L. McQUESTON, "the father of the Klondike," has bought a home at Berkeley, Cal., and will return to Dawson in May, '99.

W. J. CHALMERS, Pres. Fraser & Chalmers Co., Chicago, Ill., has returned home from Coeur d'Alene, Idaho, and Spokane, Wash.

L. L. MEYERS, Supt. Malakoff mine, North Bloomfield, Cal., is in San Francisco, having come to attend the obsequies of H. Pichoir.

ADMIRAL DEWEY, who is interested in several mining enterprises on this coast, is expected in San Francisco from Manila about Dec. 6.

W. M. BAINBRIDGE, formerly Supt. of the Elton mine, Cripple Creek district, Colo., has taken a lease of the Boss Tweed mine in Tintic district, Utah.

GILBERT MCM. ROSS, Gen. Mgr. Comstock Pumping Association, will have personal charge and control of the work of drainage on behalf of the Association.

PROF. SHALER, an Eastern geologist, predicts that in the distant future Lakes Superior, Huron, Michigan, Erie and Ontario will cease to pour over Niagara, and that the four upper lakes will find their outlet at Chicago.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WASH-BOILER ATTACHMENTS.—August Rantala, Navarro, Cal. No. 612,788. Dated Oct. 13, 1898. The object of this invention is to provide an attachment for boilers which are used for boiling clothes so that the clothes may be kept in position in the lower part of the boiler and prevented from rising to the surface, which is liable to cause the water to boil over during the operation. It consists essentially of an open work frame made of wire or suitable material so shaped as to approximately fit the interior of the boiler and having a handle by which it may be introduced and removed. At one end is a slidable wire frame guided upon parts of the main frame and having a lever and handle by which it may be removed and afterwards locked in position so that when withdrawn the whole device can be easily set into the boiler upon the clothes which are already

in place, then by pushing the lever the slidable portion is forced outward longitudinally and the two ends of the device are thus caused to bind and lock the device firmly within the boiler. Within the ends of the frame are inwardly converging plates which serve to direct the water which boils up at the ends and around the curvature of the boiler toward the center, thus preventing it from being thrown over the top.

GRADER, DITCHER, AND ROAD AND LEVER BUILDER.—S. W. Wible, Bakersfield, Cal. No. 612,579. Dated Oct. 18, 1898. This invention relates to an apparatus which is especially designed for the building of roads and levees, for grading land, for making ditches, and for the various operations which are carried on in connection with the irrigation of large tracts of land. It consists of a triangular frame, of which the apex forms the front, one side being in the line of travel of the machine and the other or hypotenuse diverging outwardly from front to rear. The machine is supported upon wheels at the angles of the frame and is provided with lever mechanism by which it may be raised or depressed with relation to the wheels. A plow is attached to the frame near the front, this plow having no land side. This turns the earth up in the line of travel rearwardly, from this is a series of concave disks centrally pivoted upon the diverging side of the frame, the lower edges so disposed with relation to the surface of the ground that the first of the disks and each successive one takes up and transfers the material which has been turned up by the plow rearwardly and outwardly, thus delivering it at a considerable distance from the line of travel of the plow. In order to resist the side thrust or tendency to push the machine toward the land which is caused by the action of the plow and the disks, a revolving cone is journaled upon a standard so placed with relation to the vertical uncut earth at the side of the furrow that the periphery of the cone rolls against this solid earth and practically acts as a land side, the cone being placed at the rear of the machine.

DENTAL ENGINE.—A. E. Macdonald, San Francisco, Cal. No. 612,593. Dated Oct. 18, 1898. This invention relates to improvements in dental engines. It consists of a hinged swinging bracket arm, a vertical shaft journaled in the outer end thereof, a disk carried by the shaft, pulleys and a driving belt by which the disk is rotated, a horizontal shaft journaled transversely above the disk and a wheel adjustable thereon having its periphery in contact with the face of the disk so that it may be moved from the central point where it is stationary, to either side and toward the periphery of the disk, thus driving the wheel in either direction and varying the rate of speed according to the distance that it is moved from the center toward the periphery of the disk. The wheel may travel upon a feather on its shaft and by means of a parallel traveling clutch and cords connecting the guide of said clutch with a treadle, the wheel is controlled and instantly moved to any desired point to drive in either direction, reverse, or stop the motion instantly.

MINERS' CANDLESTICK.—Antone Nissen, Shasta, Cal. No. 612,432. Dated Oct. 18, 1898. The object of this invention is to provide a miners' candlestick which can be so fixed in the various positions required when in use in a mine that the candle will always remain in a vertical position without relation to the supporting arm, and in conjunction with the required parts are such simple tools as are most generally used by miners in their work, such as the fuse cutter, cap crimper, etc. The invention comprises a bar folded upon itself with parallel separated sides having the bight expanded to form a ring, an elastic sheet metal socket upon one of the ends open at one side, having a projecting thumb-piece, a second bar pivoted between the sides of the first one, near the socket-carrying end having one end projecting exterior thereto and pointed so as to be inserted into a rimber or other support and the other end bent to form a hook which coincides and is foldable within the ring of the first named portion when the parts are closed together. Between the meeting edges of these two foldable bars are formed, first, cutting edges by which the fuse may be severed to the proper length, and, secondly, semi-circular grooves formed in the opposing bars in such a manner that they will receive a cap and crimp it upon the fuse when the parts are closed together.

DENTAL FOUNTAIN CUPSIDOR.—Wm. M. Avery, San Jose, Cal., assignor to the S. S. White Dental Manufacturing Co. of Philadelphia, Pa. No. 612,655. Dated Oct. 18, 1898. This invention relates to a cupsidor which is especially designed for use in connection with dental chairs. It comprises a trap with an open top, a bowl fitting said open top and adapted to be readily lifted therefrom, said bowl having a central opening, a perforated water pipe extending upwardly through the opening having a deflecting or discharging upwardly at an angle and an adjusting screw cap to regulate the supply of water. A litter trap is situated below the discharge opening of the bowl and the same trap serves to prevent the entrance of any gas from the discharge pipe with which it connects. A saliva pipe leads through the side of the trap discharging downwardly interior thereof with a water pipe connecting with the chamber into which the saliva is discharged having an injector opening through which the water is delivered to produce a suctional draft from the pipe and this is provided with a regulating screw by which the amount and force of the jet are regulated. The device may be raised, depressed and its position regulated by means of a double jointed bracket in which the vertical telescopic discharge pipe is supported, and by means of a set screw it may be fixed at any desired point.

Sulphuretted Hydrogen.

Written for the MINING AND SCIENTIFIC PRESS
by A. S. COOPER.

In the quicksilver mines near Williams, Colusa Co., Cal., and in the tunnels driven for water near Santa Barbara, Cal., and in many other places, sulphuretted hydrogen has been very annoying and dangerous to life. At Santa Barbara it proved fatal to two workmen.

It is highly poisonous when breathed in a concentrated form, and when present in the air in minute proportions it is rapidly fatal to the lower order of animals. A single gallon mixed with twelve hundred of air will render it poisonous to birds and one in one hundred will kill a dog. When inhaled it acts directly upon the blood, thickening it and turning it black.

When present in the air of a chamber of a mine it may be instantaneously destroyed by the action of a small quantity of free chlorine. Chlorine manifests an intense affinity for hydrogen. When chlorine in a free state is brought in contact with sulphuretted hydrogen it tends to "draw out," as it were, the hydrogen from its combination with sulphur, forming muriatic acid, free sulphur being deposited, and by this action absolutely destroys the noxious sulphuretted hydrogen gas.

Chlorine gas for this purpose can be generated in the following manner: Chloride of lime mixed with water and exposed to the air in shallow vessels, if possible, upon a high shelf.

This compound is gradually decomposed by the carbonic acid of the atmosphere, and the chlorine, being evolved, falls slowly down from the high places. Owing to the fact that it is a very heavy gas when compared with atmospheric air or sulphuretted hydrogen, it is diffused through the chambers or tunnels. If a more rapid action is required, a little dilute sulphuric or hydrochloric acid may be allowed to drop into the chloride of lime solution from a vessel suspended above it, by means of a piece of lamp wick arranged in the form of a syphon.

Another method is to suspend in the chambers cloths steeped in a solution of chloride of lime, care being taken to avoid excess.

It must be borne in mind that chlorine in any form must be used only as an aid to proper ventilation. It is a necessary condition for health that our mines or tunnels be properly ventilated.

A cloth moistened with alcohol and held before the mouth is good protection against the inhalation of sulphuretted hydrogen.

The acids formed by sulphuretted hydrogen in the atmosphere or an atmosphere charged with chlorine attacks the eyes, causing great pain.

This action on the eyes may be partly avoided by frequently bathing the eyes with a solution of borax in water.

The Oldest Known Rock.

N. H. Winchell, describing the greenstones of Minnesota, considers them the bottom of the Archean scale and the representative of the original crust of the earth formed from the molten mass by the earliest consolidation. The greenstones are divisible into two parts, one igneous and the other clastic, the latter succeeding the former with a confused and apparently sometimes non-conformable superposition, somewhat as surface eruptive rocks might be superposed, in the presence of oceanic action, upon a massive of the same nature at the same place. The clastic portions of the greenstones vary to more silicious rocks, constituting great thicknesses of graywackes, phyllites and conglomerates; and as such they have been converted by widespread metamorphism into mica schists and gneisses, the alteration coming on by degrees, increasing in intensity toward centers of granitic intrusion and toward the great areas of granite and igneous gneiss. Such granite and such metamorphic rocks, as a whole, have been considered the basement rock, the oldest known rocks of the country. But, following up the long known fact

that the Laurentian granite and igneous gneisses cut the schists and sedimentary gneisses and hence are younger, they are thus shown to be younger also than the bottom greenstones. They occasionally penetrate these greenstones and change them to amphibolyte and pyroxene gneiss. These metamorphic schists and gneisses seem to be a representative of the sedimentary portion of the Lower Laurentian of Canada, while the igneous granite and gneisses are as plainly a general parallel of the igneous portion of that series. It follows, therefore, that the Canadian Laurentian is, as a whole, of later date than the greenstones, if the succession is the same as in the Northwest, and that the greenstones should be considered the bottom rock of the geological scale.

These "greenstones" are supposed to represent the primeval crust of the earth. The possibility of the deriva-

that possibly, owing to the chemical characteristics of potassium, it remained in the earth's atmosphere until the consolidation and also the cooling of the first crust sufficiently to allow the ocean to rest upon it, and that it was then rapidly extracted by the moist, heavy atmosphere that prevailed, being carried into the sea.

A Three-Cylinder Gas Engine.

In December, 1897, the Hercules Gas Engine Works of San Francisco, Cal., built the three-cylinder gasoline engine shown in the illustration for the Alaska Railroad and Transportation Co. The engine was installed at Chilkoot pass, Alaska, and has since furnished the motive power for a Hallidie long service aerial rope tramway over the pass. In this regard it may be mentioned that two companies operating steam-driven rope tramways could not stand

ized for successively igniting an already prepared mixture of air and hydrocarbon (previously heated by the waste gases) on its entrance into the cylinder, or for causing this mixture to explode—that is to say, if the mixture be passed into the cylinder through wire sieves, it will be gradually consumed as it enters, while if instantaneous combustion be desired the sieve or the like is omitted, thus allowing the flames to strike back and the whole of the mixture to be exploded in the chamber provided for it. The first ignition of all must be effected in some other manner in order to provide a combustion product for the second and succeeding ignitions.

With the object of attaining the highest economy, the highly compressed air, which is cooled during the compression, is heated directly or indirectly, partly by the waste gases or other suitable heating device and partly by the highly heated compressed residual products of combustion, and the hydrocarbon is conveyed into this air, ignited and consumed. The direct heating by the residual products is effected by the air necessary for the process being admitted to the compressed residual products left in the cylinder, upon the next stroke, whereupon both gases become mixed. If economy becomes less considered and a greater effect required, the working diagram may be increased by diminishing the compression diagram—that is, by reducing the residues to be compressed to a minimum, so that the air is mainly warmed by the waste gases. For the same object the temperature of the waste gases may be raised to the highest degree permissible for the material—that is to say, the end pressure of the diagram and the diagram itself be thereby increased. It is, however, as stated, preferable not to spare the compression, as the value of the process depends on the temperature of the air before the hydrocarbon is conveyed to it. The preliminary compression also assists the mechanical parts of the machine, as the distributing gear is thoroughly unloaded thereby.

THREE CYLINDER GAS ENGINE.

tion of the alkaline magma from these ferro-magnesian rocks by any of the methods of lixiviation or of differentiation which are currently proposed by geologists who have lately discussed the origin of the igneous rocks is denied. Accepting this ferro-magnesian crust as the rock of the first magma of the earth, argument is made that it could not give rise to minerals consisting largely of a potash base, such as orthoclase and microcline, which constitute the greatest distinguishing element in the alkaline magma, nor could it give rise to the preponderating percentage of silica which accompanies the potash minerals. These characters must have some other source. The potash is believed to have existed in the ocean itself which immediately followed the consolidation of the first crust. Such an alkaline ocean, especially if heated, would hold in solution much silica. Hence followed the precipitation of alkaline silicates, and of excess of silica; hence, also, the alkaline character of the schists and gneisses when its sediments were formed into rock and metamorphosed; and hence, when fused, the alkaline magma. As to the cause of this potassic ocean by which the great stock of the world's potash was stored in the Archean rocks, it has been suggested

the competition and had to quit.

By throwing a latch on exhaust valve stem any one of the three cylinders can be "cut out," leaving two cylinders to do the work on partial load, or two can be "cut out," leaving only one cylinder in actual operation. The economical range of power and speed of engine shown is from 12 to 45 H. P. and 175 to 250 revolutions.

The Hercules people are preparing to build four-cylinder engines of about 200 actual horse power for marine and stationary work.

Attaining a High Ignition Temperature.

A recent invention by G. C. Dymond of Liverpool, England, has for its object an improved process for attaining a very high ignition and maintenance of the greatest economy in hydrocarbon engines, and is carried out as follows: A portion of the discharge gases is left in the cylinder for the purpose of the ignition by a premature closing of the discharge valve, and compressed to twenty to thirty atmospheres (admission pressure). By this comparatively low pressure an increase of temperature is produced from the normal discharge temperature of 350°-400° to 1600° C. This high temperature is util-

If the products of combustion are expelled by means of air at the end of the expansion, with the object of cleaning the cylinder, the air must be heated to a suitably high temperature in order to enable it to be used in place of the combustion products. The interior of the cylinder is, of course, so arranged that the incoming air absorbs rather than gives off heat.

In 1878 the Western Union Telegraph Company's average receipts per message were 38.9 and the average cost 25 cents. The average receipts last year were 30.1 cents and the average cost 24.7 cents. The low point in cost was in 1892, when the outlay per message was 22.3, with the average income 31.6. As 1 cent per message means on the basis of last year's business \$621,737, the difference in cost between the low rate of 22.3 in 1892 and the cost last year of 24.7 means a loss of over \$1,500,000 in the net profits.

In a new feed water regulator a float is placed on the surface of the water, and connected with a rod running to a sliding plate on the outside, which slides across a fixed plate to form an electrical connection as long as the water is low, the current operating a magnet, which opens or closes the valve in the feed water pipe.

Mining Summary.

ALASKA.

From Dawson and the Atlin lake district 185 passengers on the steamer Rosalie report the beginning of winter in the north, ice forming on the lakes of the upper Yukon. Caribou crossing, the connecting water between Lakes Bennett and Tagish, was reported as freezing a few days before the Rosalie left. Winter is also commencing around Lake Atlin. The passengers from that district left Atlin City Oct. 3rd, and say that the creeks were then freezing over each night. New strikes are reported forty miles north of Atlin City, where, it is said, from \$5 to \$6 to the pan is being washed out. A little north of Discovery, on Pine creek, are also said to have been found rich diggings.

ARIZONA.

B. Collins shipped from the Blackfoot mine 343 sacks of ore that averaged \$150 a ton in gold, silver and copper.

Parsons & Co. have leased the Pot Holes gold properties on the Colorado river, near Yuma, and for several weeks have been taking out ore. They started the mill last week.

Eighteen men are employed in the French Gulch copper mine, near Prescott. In the Purcell group, near Tucson, the vein is over 3 feet wide. Garrett & Brown are developing the Middle March property, in the Dragon mountains. At a depth of 200 feet, 5000 pounds of ore from the Good Hope mine, in Yavapai county, ran 6.6 ounces in gold and 3.7 per cent copper, dry; the net return being \$105.87 per ton.

At Chloride grading has begun for the 50-ton concentrator. Taking out ore from the mine will continue. The concentrator ore will be piled up until the mill is finished and the shipping ore sent to the smelter. They are shipping from sixty to seventy-five tons per week to Pueblo. A carload of high grade ore is being taken out monthly from the World's Fair mines, in the Harshaw district. Sept. 27th twenty tons were shipped, which returned over 1000 ounces of silver, \$6 in gold and 22 per cent lead. A 10-stamp mill and three concentrators handle the ore not shipped. The veins are from 1 to 20 feet in width.

Nogales *Vidette*: In the copper group of mines, near Fairbank station, a strike was made of ore that assays 60 per cent copper and some gold and silver.

Yuma *Sum*: Operations at the Little Jessie mine, Yavapai county, have been retarded, pending the arrival of a wire cable for the main shaft. Various companies are figuring on plans and estimates for the erection of the 200-ton cyanide plant. A strike is reported in the Storm Cloud mines, near Prescott, of 6 feet of good rock. Two shafts have been started at the Tennessee mine, Mohave county, and will be sunk 200 feet. Little's group of mines, in the Cerbat section, Mohave county, have been bonded to M. Cushing, of Prescott. A silver and gold discovery has been made south of the Connor and Minnesota mines, Chloride. Official filing of claim locations in the new coal fields, partly in Pima county and partly in Graham, may be begun November 19th. A. L. Grow, of Tombstone, is working twenty-eight men at his mine taking out good ore. Twenty-eight others are working. In the Providence mine, in Yavapai county, thirty men are at work. There are over 400 men at work in the Nacozari district, Cochise county. Placer mining in the Hassayampa country, Yavapai county, is retarded owing to a scarcity of water. Boston and New York capitalists have been investigating the Black Rock properties, in Graham county. The gold mill is about ready for operations on the Belle McGilroy mine, in Mohave county. The Java mine, on Stockton Hill, Mohave county, have been bonded to M. Cushing, of Prescott.

Mohave County *Miner*: Water was turned on last week at the hydraulic plant of the Temple Bar Con. M. Co. at Temple Bar, on the Colorado river. The washing of gravel is by direct pressure. An electric light plant is also in use.

Globe *Belt*: Supt. Amster has increased the force at the Continental mine. A diamond drill will be used to prospect 1000 feet deep.

CALIFORNIA.

Amador.

F. Woodworth of San Francisco is assaying the Pacific dump at Plymouth to see if it will pay to work by the cyanide process.

The *Dispatch* says that work is to be resumed shortly on the Gover mine, near Amador City, under the supervision of H. Eudy of Jackson. At the Spagnoli mine work has resumed; water reached the mine last week.

Ledger: The old Sorocco mine at Pine Grove is unwatered and there is plenty of ore in sight. A hoist has been erected and the owners are talking of putting up a mill.

Record: The Wildman-Mahoney Co. of Sutter Creek has begun work on the new reservoir. There are 2000 feet of ditch to dig and the laying of 4000 feet of iron pipe. The plant will give a pressure of 525 feet at the Wildman mill. The Emerson shaft is down 300 feet. There is still a shortage of water, but half the full number of stamps, eighty, are dropping at the two mills. At the Lincoln mine they have finished hauling 200 tons of ore to the Zeile mill. From indications, it is believed the rock will pay over \$40 a ton. The Centennial mine at Plymouth is giving out contracts, which promises their starting once more. The Wheeler mine has found some good rock. The Bay State mine continues working.

Butte.

Work has resumed at the Gold Bank mine at Forbestown, with 100 men employed.

Oroville *Register*: Three dredgers will soon be operating near Oroville, in Feather river, and four more to be built. T. W. Reece with a big force of men and teams is building

a dam near Whiterock, for hydraulic mining near Oroville. There are thirty-five men employed in the DeLong mine on the North Fork. The company has built nineteen miles of road and two bridges. When they get within 6000 feet of the river they had to let down their machinery with cables, owing to the steepness of the mountains. The company will put in an electric light plant and other machinery and next summer 150 men will be employed.

Calaveras.

At the Gwin mine the pumps have been removed from the old south shaft to the new north shaft. Two pumps hoist water from the 1400 level, each hoisting 700 feet. They are run by compressed air. The mine has good ore in the 1000, 1200 and 1400 foot levels. The 40-stamp mill has been running since Oct. 1st.

Citizen: At the Marshall mine, near San Andreas, a small force is at work, which within two weeks will be increased. At the Sieffert mine good ore has been found. At the Ford mine work continues night and day. The directors have decided upon placing a 10-stamp mill on the property. At the Lively mine both shafts are being worked and thirty men are on the payroll. The clean-up last week was encouraging. The first shipment of one carload of sulphurets was made recently. At the Thorpe the Cal. Expl. Co. has a full force at work. For the Utica mine, Angels Camp, the ditches have been widened 2 feet, the flume improved and sufficient water is assured. At Mokelumne Hill the Esperanza mill will start up next week. The mill will be started and active operations continued.

Prospect: Cuneo Bros. are putting up a 3-stamp mill at San Antonio Camp. Quintero & Co. have bonded the Yellow Aster quartz claim to Morgan & Co. for \$4000, to be paid Nov. 1, 1898. The new company has taken out over thirty tons of ore that runs over \$40 free milling.

El Dorado.

(Special Correspondence).—The prospecting of new properties and the resumption of work on idle mines in El Dorado county has been more extensively followed, pursued with more energy and the investment of more capital within the past eight months than has been the case in the county's history. As evidence of this assertion is the extensive work on the Crown Point group and the Selby property near Diamond Springs, the Hill Ranch mine near El Dorado, the Gold Bug in Placerville and the Gold Note and Philadelphia at Omo Ranch. These properties together employ over 100 men. They are all in a state of development.

Placerville, Oct. 24th, '98.

Work is being done at the Eagle King mine at Grizzly Flats, preparatory to putting up the hoisting works. The property is owned by Melton & Witmer of Placerville.

Republican: The German mine near El Dorado is being unwatered for further operations. A company has reopened the Strahle slate quarries near Kelsey. J. F. Wetzel of San Francisco is Pres. and J. Strahle, Mgr. The business will be conducted on a co-operative plan, partly in cash and partly in stock.

Inyo.

Independent: A group of developed ledges in Beveridge district has been bonded to people representing a Chicago company. Anthony's mill in Pleasant canyon is running on custom.

The O. B. J. mine, in Tuba canyon, keeps the mill at Postoffice supplied with ore. Mgr. Harrison is working sixteen men on the Halbert & Ratcliffe claims.

Kern.

Randsburg Miner: A cyanide plant is to be erected at Cuddebeck lake, to work the 5000 tons of tailings at the mill. Work will soon begin. A small run of ore from the Val Verde mines was made at the Cuddebeck lake mill last week, yielding fair returns. The Eureka mill cyanide plant made a clean-up estimated at \$1200. The mill is running on a 15-ton lot of ore from the Napoleon mine in the Stringer district which will go \$100 per ton.

Los Angeles.

At the Red Rover Mining Co.'s property the mill started up on the 25th of this month. The shaft has been repaired and everything put in shape for a continuous run. The company has good ore.

Nevada.

Sinking will soon begin at the California mine, near Grantville, the new hoist having arrived.

The superintendent's report of the Brunswick mine, at Grass Valley, for the week ending Oct. 22 shows 171 tons milled ore, and 176 ounces of amalgam. Average stamps at work fifteen; average drops per minute ninety-six. The drift on the 700 level is 396 feet, and a drift has been started on the 1000 level. On the 700 are 10 inches of good milling ore. There are sixty-four men employed.

Union: A strike has been made at the Central shaft of the North Star Co. near Grass Valley in which work has been in progress for nearly two years. The theory of Mgr. Foot has been that a shaft would strike the old New York Hill ledge at a depth of 650 feet. The workmen found the ledge at a depth of 640 feet. The ore proves to a certainty that it is the New York Hill ledge. The mining of the river bed near French Corral by Thomas & Curtis closed down for the winter months. The operations have paid well and they will resume in the early spring.

Grass Valley Telegraph: Southern's 8-stamp mill is crushing eighteen tons of rock daily for the Wisconsin mine. On the old Gold Hill mine the new shaft is down over 1000 feet. About fifty men are employed. The Omaha mine employs seventy men and is through three shafts. They are 1700 feet deep on one of these. The power used is water, steam and electricity, the 28-stamp mill, 800-pound stamps, being operated by water, the pumps by steam and the hoist by electricity. On the Pennsylvania the shaft is 700 feet deep and there are about 3000 feet

of drifts. The vein averages 18 to 20 inches in width and the ore, which occurs in bunches, is worth over \$30. The 5-stamp mill, run by electricity, will soon be increased five stamps.

The W. Y. O. D. mine is operating its 20-stamp mill by electricity. The shaft is down 1100 feet. It gives employment to sixty-five men. The Wisconsin mine has a shaft 800 feet deep on a ledge about 12 inches wide. About fifty men are at work, chiefly on the contract system. At the Allison Ranch mine the shaft is 900 feet deep. Both sinking and drifting is being done, and some ore which was crushed on trial paid well. There is a fine Reider pump installed at the 400 level. Pumping and drilling is done by air compressors, the power being steam and water. On the Empire the shaft is 2350 feet deep, and 180 men are employed. The 40-stamp mill is new and there is a new hoist. One notable thing at the mine is the crushing of the ore at the hoist. Two-ton self-tipping skips are used. The galloways-frame is 90 feet high. The Sauvee mine has a 1000-foot tunnel and a 200-foot shaft, and fifteen men are employed.

Herald: The Malakoff mine at North Bloomfield has completed the 800-foot tunnel through which it proposes to work its claim by the drifting process. About Nov. 15th opening up the channel will begin. *Union*: Action has been commenced in the U. S. Circuit Court at San Francisco by the Gold Hill M. Co. against the Peabody G. M. Co. to quiet title to a valuable strip of ground on Gold Hill, at Grass Valley, which is claimed by both parties. Both claims are patented. In case the Gold Hill title to the disputed 235 feet is sustained, the Peabody will contest the former's right to follow the dip of the vein under the Peabody land, on the ground that the ends of Hopkins' patented land are not parallel lines.

Placer.

The Pioneer Co. now employs sixty-two men; twenty-one are at work on the new dam. A tunnel to tap the ledge will be started 570 feet below No. 4 tunnel. The new tunnel will be 530 feet above the bed of the river. A flume 6x7 feet carries the water 900 feet, where with a head of 38 feet it will be used to run the 353 H. P. turbine water wheel. This wheel will operate the 270 H. P. electric generator. The electric power generated will be transmitted to the mine and will be used in operating the 20 head of stamps in the mill, the blower and two compressors. The fiscal year of the company closed Sept. 30. During six months of the year the water supply was very short. During the year were crushed 8367 tons. The figures for the year ended Sept. 30th, 1898, are as follows:

Gross receipts \$18,001

Total expenses 67,688

Net earnings 48,333

Three dividends paid of 14 1/2 each 37,500

Balance 10,833

Leader: Waugh Bros. & Duryea struck a 2 foot ledge near Auburn after a years work in a drift 325 feet. Green & Lusk struck a ledge from 8 to 10 inches wide and are taking out some good ore.

Plumas.

National Bulletin: In the Duncan mining property in Genesee valley the ledge is 8 feet wide. The ore assays \$10 per ton gold, thirty ounces silver and from 30 to 60 per cent copper. Mrs. Gruss contemplates building a 10-stamp mill on the Genesee M. Co.'s property.

Riverside.

From the tailings at the Santa Rosa mine, near Perris, \$400 a week is the usual gold product.

San Bernardino.

The Pacific Coast M. Co. is putting up an ore crusher on the Fleming property, on Old Baldy mountain.

San Diego.

(Special Correspondence).—A Mr. Douglass, a mining promoter of Los Angeles, has been inspecting the Owens mine at Julian and the Elevada at Banner in the interest of Pittsburg, Pa., capitalists.

M. More and another Denver man went again this week to examine the lower levels of the Helvetia mine in the Julian district for Denver people.

The cyanide proposition for treatment of the tailings of the old Stonewall property at Cuyamaca is now well under way, quite a number of men being employed in putting the plant in place. A disinterested person claiming to be well informed says there is some quite rich tailings and ore of an earlier date in a "draw" covered by the tailings of later operations.

A considerable amount of eleventh-hour assessment work is now being done, the \$50 worth of work required as a locating contingent heading off the professional biennial locator.

Mr. Somes of Los Angeles is in San Diego with a view of building a copper smelter. Ten acres of land have been tendered and a cash bonus is being worked up with probable success. Mr. Somes says ample copper ore of good grade is offered to keep the smelter in blast.

San Diego, Oct. 24th, '98.

Shasta.

San Francisco people have bonded the '49 mine at Shasta and are taking out ore that nets \$20 at the smelter. The old Phoenix mine—a large body of low grade ore near Shasta—is being examined by San Francisco people for a foreign company.

Redding Free Press: The system for ascertaining the depth of the ore bodies at Johannesburg, South Africa, has been tried on the ore body at Iron mountain. Borings reveal ore to last 100 years. The scale of operation on which the Mountain Copper Co. is conducted is being broadened.

Free Press: The old Silver King mine near Redding is being reopened and sinking is in progress. Two tons of ore from the Washington mine near French Gulch, taken out by lease, was shipped to the Selby Smelting

Works, San Francisco, last week.—T. E. Johnson bought the East Delta quartz mine in the Dog Creek district for \$1000.—R. M. Moore sold to J. P. Hynes an eighth interest in the Snow Storm, Golden Jubilee and Day Dawn quartz mines in Muletown district.—H. F. Eckert bonded to Small & Dawe the Mascot quartz mine near Shasta. San Francisco and Oakland capitalists formed the Shasta Slate Co., for developing slate beds at Slatis, and a force was put to work last week.—Work has begun on the Andrews & Sperry slate properties. The company will erect machinery at once and begin the manufacturing of roofing slate.

Searchlight: The Stillwater copper claims, held under bond by Lewisohn Bros. of New York, have ceased operations temporarily. A representative of the Eastern capitalists will be here soon to inspect the property.

Mountain Miner: Last Monday the Mountain Copper Co. shipped fifteen cars of matte to their refinery in New Jersey, a total tonnage of 1,138,000 pounds.

Sierra.

(Special Correspondence).—The North Fork Gravel M. Co. at Forest, after years of labor and great expense in running their tunnel, have finally reached the channel and are taking out rich gravel, some of it paying as high as \$4 a car.

Forest, Oct. 24th, '98.

Messenger: W. W. York, owing to the lack of water, shut down the mill at his mine near Downville, but extracting ore continues.

Union: At the Oriental mine, near Allegheny, good progress is being made, and as soon as the machinery is in place the old shaft will be unwatered and sinking begun. The shaft is 600 feet deep; when the mine was running many years ago it was noted as a rich pocket property.

Siskiyou.

The Diesthorst Bros.' dredger on the Klamath river has closed operation owing to the scarcity of water.

A. F. McClain of Tacoma, representing an English mining company, last week bought the R. H. Campbell hydraulic and drift mines in Quartz Valley. Work in these mines has been suspended for some time, but it will be resumed shortly and a large number of men given employment. The property comprises 1500 acres on Sucker Flat, and owns about 8000 inches of water which supplied three giants under 200 feet pressure. The company also owned three ditches, each about twelve miles long. The bank is said to be from 20 to 45 feet high.

Journal: The Eastern company prospecting Yreka creek basin from Shasta river to Yreka has secured an extension for thirty days to prospect additional ground.—The Seattle company which bought the Cape quartz mine on Humboldt had a test crushing of four tons and are satisfied with results.—The hydraulic and quartz miners are fixing up for the rain and snow; and if a favorable season, the output of gold will be large. In the high gulch diggings owners have a large quantity of pay gravel for sluicing.—The Greenhorn blue gravel mine is reported paying well. Water is pumped from the mine into the sluices.

Trinity.

(Special Correspondence).—The effort on the part of a few individuals some eighteen months ago to boom a particular section of this county in a measure reacted upon the would be promoters and indirectly did the county no good. But the perseverance of a more conservative class of men—men who understand mining and fully know the merits of the mining sections of Trinity county—has succeeded in a measure to overcome the effects of the wild rush and its consequent condemnation by the disappointed gold seekers.

Through the efforts pursued by these latter people capital has been persuaded to make experiments and satisfy itself that the county is deserving of closer investigation. The placer grounds are not by any means worked out, but to operate them with method and profit as a rule requires large capital. The county has opportunities for hydraulic and dredging operations. At Trinity Center a company is outfitting the former Bloss & McClary grounds to operate largely after the fall of snows and spring waters, for which large storage capacity is being provided.

At Abrams, twenty-five miles above Trinity Center, an English company is outfitting a drift property on broad plans, and P. Holland, in the same neighborhood, operates nine months of the year with 20,000 inches of water.

At Lowden a company is building a dredger and will give considerable attention to continued prospecting for permanent working of the river.

The construction of the long tunnel at the Brown Bear mine and the workings of this standard property have been previously noticed, and hence no further attention than a mere allusion to this paying property of many years' operations is given it at this juncture.

At Dedrick C. P. Wingate is placing considerable machinery on the Chloride-Bailey quartz properties, on which a thorough system of development is in progress.

At New River a company of San Francisco and New York tobacco capitalists are giving attention to the opening of several quartz mining claims.

The La Grange Hydraulic Co.'s gravel plant near Weaverly of nearly 500 acres and its great tunnel have received extended notice in the MINING AND SCIENTIFIC PRESS, as have the properties of the Cie Francaise at Junction City.

The systematic opening, however, and thorough test being given to quartz properties, and bringing in plants of machinery that are freighted by wagon for nearly seventy-five miles and then packed across mountain trails by ingenious and costly methods, partially demonstrate that capital has faith in mining and is finding properties within the recesses

of the mountains of California in which their investigations, and consequent investment would forborne stability and permanence.

Weaverville, Oct. 24th, '98.

C. B. Wingate, Mgr. Chloride and Bailey mines at Dedrick, is shipping machinery to these mines in quantity, denoting heavy operations.

On Coffee creek, near Carrville, Mrs. R. D. Lawrence is developing two claims and getting good ore, some which is high grade, but not free milling.

Tuolumne.

At the Santa Ysabel no crushing has been done at the mine for a month. Prior to that time, after the water supply failed, the mill was run irregularly by steam, the twenty head of stamps being operated a portion of the time by that motive power. Since the mill was closed there has been continued sinking and cutting under the central ore chute at the 400-foot level. The shaft is now down over 500 feet and will be pushed to the 1000-foot level. Drifting on the 400-foot level is now under the 200-foot level where the strikes in the central ore chute were found.

Oscar Newhouse has sued E. A. Wiltsee, his partner, to compel an accounting for \$75,000 worth of ore said to have been taken from the Providence mining claim. He alleges that the mine is being worked in a wasteful manner, and asks that the partnership be dissolved and that he may be awarded his rightful share of the property.

Mother Lode Magnet: A new mine is being developed near Byrne's Ferry by the Green Spring M. Co.—The 10-stamp mill of the Longfellow M. Co. at Big Oak Flat is running on good grade ore.—At the Grizzly M. Co., near Carters, the shaft is down 869 feet. At 280 feet good quartz is found. On the 350 level a crosscut is being run to cut the ore body.—Drifting has begun at the Mazepa mine at Stent and sinking will be resumed soon.—The Dutch mill at Quartz closed down for lack of water. The mill, ore bins and stopes are full of ore.—A strike has been made in the Putnam mine at Montezuma, the vein varying from 18 inches to 3 feet in width.—At the Shawmut 160 men are employed.—At the Densmore mine, near Columbia, thirty men are employed.—The Old Two mine at Jamestown has been bonded to San Francisco people.—Thirty men were put to work at the marble quarry last week.—In building a ditch sixteen miles long from the Stanislaus river to the Philadelphia diggings thirty men are employed. The ditch will carry 1500 inches of water. It is 4 feet at the top, 2 at the bottom and 2½ feet in depth. It has 13 feet fall to the mile.

Banner: At the Star mine, near Columbia, a number of improvements are in progress.

An English company owning property near Robinson's Ferry began work on a large dam at Horseshoe Bend for power purpose.

Union Democrat: The Standard Co. of Bodie has a bond on the Excelsior mine, near Confidence, and has ten miners at work. A shaft has been started and will be driven to good depth. A hoist is being put up.—At the Grizzly mine, near Summerville, twenty men are at work. The 20-stamp mill will run as soon as water is secured, and the force will be increased.

Independent: At the Peterson mine, Saw Mill Flat, three eight-hour shifts are storing ore to be worked when the rains come. From a 300-foot tunnel a shaft 100 feet has been sunk, where the rock is taken.

Yuba.

Marysville Appeal: In the suit entitled J. C. White vs. Good Title M. Co., Dobbins, Judge Davis has ordered judgment for plaintiff for \$311.12.

COLORADO.

BOULDER COUNTY.

The Enterprise people of Eldora have eighty men at work on the foundation for a 50-ton chlorination mill.—The Mogul tunnel, at Eldora, is being driven 200 feet per month.—The Boston Newmarket G. M. Co. bought the Teller mine, near Ward, for \$5500. They have obtained a thirty-day option on the Davidson claim for \$8000. Each claim is 150 feet wide by 100 feet long.

Ward Gazette: The Adit is shipping 1000 tons of ore to the smelter.—The B. & M. mine sent twenty tons of high-grade ore to the smelter last week.

CHAFFEE COUNTY.

Negotiations are in progress for the reopening of the old Stonewall mine of the St. Elmo district. The mine produced a large amount of ore years ago, but when the railroad stopped running heavy transportation charges compelled it to close.

CLEAR CREEK COUNTY.

The Centennial mine, at Georgetown, has a shaft 600 feet deep. Drifts have been run 900 feet in ore averaging \$40 in gold and silver to the ton, 55 per cent of which is silver and 15 per cent gold.—The Dunderberg has an 80 H. P. plant of machinery, three shafts ranging from 700 to 1000 feet deep and several miles of drifts, and is shipping regularly.

The Cashier mine at Empire, which has a 20 foot vein of low-grade ore, is about to resume operations.

EAGLE COUNTY.

The Eagle River M. & M. Co. of Red Cliff is driving a tunnel to develop 1000 acres of mineral territory. The tunnel is in 300 feet and is to be driven two and one-half miles farther.

Blade: The Battle Mountain district shipped ten carloads of ore the past week and 383 since January 1.

EL PASO COUNTY.

The 80-ton test of the sandstone deposit of Woodland Park, made in the Frisco mill, has proven a success. The ore runs \$4 in gold per ton, and of this the mill saved \$3.72 per ton. The claim is made that the ore can be treated at a total cost of 40 cents per ton. The deposit averages 200 feet in depth.

The Extension G. M. Co. recently bought

the Jefferson lode at Victor, and last week paid off the mortgage of \$18,500 on the property. The mine has 1000 feet of development and a plant of machinery.

The purchasers of the Lafayette, Cripple Creek, are Buffalo, New York, women, who operate under a company known as the Princess Alice. They paid \$80,000 cash. They also bought the property owned by the Seven Hills Co., and the Hillside, on Womack Hill.

Fisher & Co., leasing on the Pinto, average an output of twenty tons every twenty-four hours, and at least half of it is a high grade smelting rock.

Potvin & Vaine at Victor, as the result of an eighteen months' lease on the Christmas, which expired last week, cleared some \$50,000, besides paying a royalty of 20 per cent, leaving a net profit of about \$17,000 each.—The cleaning up shipment from the lease of 120 tons of two-ounce ore made the output for this month 230 tons.—The Bolivia, on Galena hill, Cripple Creek district, struck 42 feet of pay ore in driving their diamond drill on the bottom of their 520-foot shaft at a distance of 250 feet. The ore assays from \$13 to \$64. About \$90,000 has been spent on this property.—At the Gold Sovereign Thompson & Co. are making weekly shipments, returns from the last consignment showing \$50 a ton.

Iowa capitalists bought the Ollie mining claim near Cripple Creek for \$50,000 cash and have begun developing the property.—The Lawson lease on the Longfellow at Victor is outputting from forty to fifty tons of \$30 to \$80 ore weekly.

The Orpha May at Cripple Creek is profitably worked under the leasing system. The Union exacts 50 per cent royalties and does the hoisting for the lessees. A station at 900 feet was started last week.—At the Strong mine the shaft will be put down to the 700-foot level before any attempt at production.

A strike in the Vindicator mine, Cripple Creek, was made in a new vein of 2 feet of sylvanite ore running \$240 a ton. There are seven shafts on the property and six are worked by lessees. All are in ore. The company shipped 1734 tons of ore last month, which had a value of \$57,343.95.

Victor Record: The Virginian claim, near Victor, was recently sold for \$10,000.—From the Half Moon nearly 1000 tons have been shipped this month from the several different leases. The ore maintains a general average of about two ounces to the ton.—The different lessees on the Specimen sent out a total of thirty-eight tons of ore last week with a gross bullion value of \$141,140.—The Anaconda is shipping from three to six cars of ore daily.—The Modoc has attained a depth of 700 feet. Additional boiler power is to be added in the near future.—The Battle Mountain tunnel is 2000 feet in the mountain and has a depth of 800 feet.

GILPIN COUNTY.

At Central City a strike was made on the Topeka mine in Russell gulch. One hundred pounds of ore from the 800 level, run through the mill, gave a return worth \$2000. The vein is a foot wide.

Observer: From test runs made at the New York stamp mill of the capacity of the new 1000-pound rapid-drop stamp, it has been found that it will require four tons of ore to each stamp every twenty-four hours when they are speeded to ninety drops per minute.

The lessees of the A. Y. and Minnie are shipping about 100 tons per day to the A. Y. mill.—Fifty wagons are hauling 400 tons of ore per day from the Ibox Co.'s mines, Leadville.—The Fanny Rawlings mines of Leadville will ship 1500 tons of gold ore this month. The ore is carbonate of copper and copper-iron sulphides. The sulphides are 50 feet thick, 25 feet being high grade. The oxides are 20 feet thick.—The last shipment of ore from the Hap Hazard mine, Lake Park district, returned eight and one-half ounces gold to the ton and some silver.

The Herald-Democrat estimates the output of the Leadville, Colorado, mines for 1898 at \$9,000,000, an increase over the previous year of nearly \$2,500,000.

LAKE COUNTY.

F. F. Harrington has made a contract with the Pueblo Smelting & Refining Co. for 10,000 tons of black iron from his Battle Mountain mine.

MINERAL COUNTY.

Creede: (Special Correspondence).—Cy Warman, the rhythmic rhymist of the Rockies, was in Creede in 1892, and wrote: "It's day all day in the daytime, there is no night in Creede." But that was when the narrow street that followed the curvatures of the Willow Creek gulch for a mile or so was bounded on either side by a solid row of two-story frame buildings and the street itself was aglare from sun to sun. It was also a time when the nocturnal activity of the inhabitants justified his epigrammatic comment. It was a time when silver was 85 cents an ounce and the Holy Moses mine was yielding its richest and best, and it was before any of the now big mines had reached the water level.

Creede, in 1893, like Cripple Creek, in 1894, passed through a conflagration which left the town in ashes. Since then rebuilding has proceeded gradually, and of quite a permanent character. The price of silver, the camp's chief product, slumped to 69 cents and below, and later the big mines were worked to a depth at which the water, coming in, became a burdensome and expensive factor. A month ago Creede's electric light plant was destroyed by fire, and to-night there is none of that glamour which once inspired the poet and charmed the wall-eyed gambler. On the contrary, all the above depressing influences have served to make this old gulch frown when the sun goes down, as it used to frown in the days when the hunter looked for bear instead of silver.

But the price of silver is advancing some. The Nelson tunnel, now in one and a quarter miles, is cutting through Bachelor mountain

to drain the big mines; the electric light plant is being rebuilt; some of the newer mines are producing gold as well as silver; the Commodore mine is now the richest producer of silver in the State, and altogether Creede is in a healthy condition with a tendency toward improvement.

The district is steadily shipping to the smelters from 250 to 300 tons of ore per day. The bulk of this comes from the Commodore, which is worked from three tunnels, one of which is a crosscut to the vein, the other two going in on the vein. The lower tunnel, known as the Commodore, has proceeded three-quarters of a mile; No. 4, which is 500 feet above, is in the same distance, while No. 3, 500 feet higher, goes in 3500 feet. Nos. 3 and 4 are connected by upraises. This property is well equipped and employs about 300 men.

The United Mines Company controls the Argenta, New Discovery and Golden Eagle, end-lining with each other and all on the same vein. The ores are a carbonate of lead, with important gold values as well as lead. A small concentration mill on this property is doing very satisfactory work.

The completion of the Nelson tunnel, which project is in the hands of a company with ample capital, will make it possible for the work to proceed on the lower levels of the New York Chance, Last Chance and Amethyst, which are now flooded with water. However, work on these mines is in progress in the upper levels.

Creede, Colo., Oct. 12th, '98.

Creede Candle: Creede shipped 113 cars of ore last week against 98 for the previous week. The bulk of this was high-grade concentrates.

OURAY COUNTY.

From Ouray 185 cars of ore were shipped in September.

SAN JUAN COUNTY.

Silverton Standard: In the Ben Butler mine at Mineral Point the ore is adapted to both smelting and concentrating purposes. A mill is in contemplation and will be erected next spring. E. Brown is the Supt. and his working force consists of twenty men.—The Toltec mine at Silverton has been thoroughly developed and has a vein that averages 50 feet in width that contains an average value of \$10 in gold per ton. The company contemplates building a 50-ton concentrating mill in the spring. A Hamill is Supt. of the property.—At the Gladstone mine within three weeks the mill will be dropping thirty stamps with a capacity of 110 tons daily.—The output shipped from Silverton is about twelve carloads of ore and concentrates per day. A number of these cars of ore will run over \$1000 each and will average over \$500, a month's shipment amounting to \$180,000, not including retorts and express shipments.—The Tom Moore is a lead producer, the average shipments aggregating two carloads a week.—A carload of ore weekly from the Lacy property of Ice Lake basin is shipped to the smelter and averages thirty-five ounces silver and 71 per cent lead.

SAN MIGUEL COUNTY.

Telluride Journal: The Tom Boy continues its output and is a source of immense revenue to its owners. The cost of operating at the present time is less than ever before, and the values produced much larger. The monthly output is variously estimated at from \$90,000 to a \$125,000. There are eight Huntington mills in the plant and these grind from 200 to 250 tons of ore every twenty-four hours. The ore is free milling, only a small amount of the values is saved in the concentrates. A person who has worked in the mill says that from six to ten balls amalgam, worth from \$800 to \$1200 a piece, are cleaned from the plates in twenty-four hours. The Tom Boy vein is the largest in the district, being from 10 to 16 feet wide, and the ore is easily mined. The mineral requires no sorting. Less than 100 men, a fair proportion of whom are prosecuting development work are employed in the mine.—The Silver Bell is shipping several cars each week.

SUMMIT COUNTY.

The Washington mine of Breckenridge district made a strike of 3 feet of shipping ore that will run \$60 to the ton. Two men are said to have taken out two carloads of ore in ten days.

IDAHO.

The deal involving the Seven Devils copper properties is reported consummated. It involves building a railroad into the vicinity of the Peacock mines, from Weiser, which must be begun within sixty days. The railroad reaches within 3000 feet in elevation from the Peacock. It will be built in part over the grade already constructed and bought for that purpose.

The Bonanza Power Co. has eighty men at work on its water ditch at American Falls in Blaine county.

A correspondent of the Weiser Signal, writing from the Seven Devils copper country, says that in the Peacock mine all of the great ore body exposed on the surface has been taken out and, aside from what has been hauled to the smelter, is piled up near the mine and is said to exceed 7000 tons, which, so far as casual observation can determine, is of high grade. The work gives this property more the appearance of a quarry than a mine—large open cuts, from which ore has been taken out, while the face or breast shows masses of ore still in place. But as no sinking has been done no ore bodies are blocked out, and therefore not even an approximate estimate of the amount in sight can be made. The work done, however, makes the surface showing more remarkable than ever, and indicates that the mine will have the required staying qualities.—The South Peacock is owned by Boston people, and under the management of J. Walton a large amount of development work has been done this summer. The shaft has been put down 126 feet and from workings amounting to 500 feet have been run.

Work is for the present discontinued and the entrance is under lock and key.

The Snowshoe mine near Libby is to be equipped with a 10-drill compressor and six drills. The mill is to be remodeled and the property put in condition for active work. About fifty men are employed. The Snowshoe was recently purchased by the Pacific Northwest Mining Corporation, organized in London with a capital stock of \$1,000,000. H. C. Walters of Spokane, the leading spirit in the new company, engineered the Snowshoe deal and is now Gen. Mgr. of the property. There is a 200-ton mill in operation and the company contemplate the erection of a 600-ton mill as soon as it can be properly located. The lower tunnel of the mine is in 1005 feet and has never been out of ore. The ore is concentrating and carries lead, silver and gold, that in the face of the tunnel carrying 25 per cent lead, twelve ounces of silver and \$12.40 gold.

Idaho World: The Jupiter mine near Idaho City has been bonded for eight months to T. K. Muir, of Portland. A small payment has been made.—McMahon & Shearer have struck a good body of ore in the lower tunnel of the Buffalo mine. They have been at work in this tunnel a year. Three inches of ore will mill \$300 a ton and a vein 12 to 24 inches will go \$30 a ton.

Florence Miner: At Warren, the Iola mine is working thirty-five men and running night and day. There is pay ore in all the workings.

—The Klebold mine and mill has 18 men on the payroll. The pay streak is only 2½ feet wide, but the ore is high grade.—The Good-enough is at work on the mill getting ready for a winter's run. This mine has a good showing and is fairly developed. The tunnel is in 1200 feet and has a depth of 700 feet. The ledge is 8 feet of pay ore.—The Keystone is working two shifts and has a body of good ore. It is working under a lease to Randall & Co. A mill will be placed on it in the spring. The Keystone has been idle a long time.—In the Sunrise the ledge is opened 500 feet and is 4 feet wide.

Idaho World: The dredges at Idaho City and that at Placerville are again running.—Stevens Bros. in the Klondike quartz claim near More have opened a ledge said to be 30 feet wide, of which 8 feet runs \$30 a ton. The remaining 22 feet will mill \$5 a ton.—A Dickinson has opened a 6-inch vein that mills \$150 a ton.

Statesman: A strike is reported in the Friday mine at Willow Creek of a streak 18 inches thick of free milling ore running \$100 a ton.

Helena Independent: A ten years' lease has been completed of the nine-sixteenths interest of the Kleinschmidt Bros. of Helena, Mont., in the Peacock, Helena and White Monument mines of the Seven Devils country. J. Glass is Gen. Mgr. of the company. They will do development work until next spring, when the tramway to carry the ore to the river, will be built. The ore bins will be on the Snake river, which runs three miles from the mine, but which is at an elevation of 3000 feet less than the head of the tramway. The company will utilize the drag of the ore buckets down that 8000 incline for the development of power to run the sawmill and electric light plant at the mine. At Ox Bow the copper smelter will be located. The buildings in which the smelter at Cuprum is constructed will not be moved, but the machinery will be taken to Ox Bow, and with additional machinery and improvements will be used in the construction of the new smelter at the latter point. With the transfer of the smelter will go the name of the former location, Cuprum. The temporary organization of the Northwest Copper Co. exists in Baker City, Or. The bondholders reside in Erie, Pa.

MICHIGAN.

The Osceola is making 900 tons of mineral a month: more than 1,000,000 pounds of ingot copper per month.

MONTANA.

The B. & B. mine near Troy has opened up a large body of good grade galena in No. 4 tunnel which assays an ounce of gold to the ton in addition to the silver and lead values. The B. & B. has nearly 2000 feet of development and is ready to be equipped with machinery.—It is expected that the Twin Bridges smelter will resume within sixty days.

The Anaconda M. Co. bought for about \$1,000,000 cash the town and lumber camp of Bonner, including the saw-mill plant which has been cutting about 40,000,000 feet per annum of pine and tamarack. This will furnish the Anaconda mine with timber for about eight years.

Basin Progress: The Gray Eagle mine at Basin is shipping five carloads of high-grade ore per week.—J. Brady at High Ore spur will ship the old Comet tailings to the smelter. The estimated worth of the dump is \$2,000,000.—Holmes & Dahlgren, in the Gray Eagle mine, have struck a large body of high-grade ore. Two years ago Holmes & Dahlgren were comparatively poor prospectors, but since that time the Gray Eagle mine has made them men of independent wealth.—At the Eva May, which for a few years had a struggling existence, the mill is running night and day to its full capacity. On the 300 level they have drifted for 250 feet on ore 18 feet wide. They have also three other large parallel bodies of ore running in width from 6 to 16 feet. The values are good.

Butte Miner: The Washoe Co. about to build smelters, was organized in '94 with a capital stock of \$5,000,000, of which amount at the time of the company's incorporation 10 per cent was paid up. The company is virtually a private corporation owned by J. B. Haggin and Marcus Daly. In the articles of incorporation their names do not appear, D. M. Newbro, J. S. and O. K. Lewis, J. Gillie and C. F. Booth being the trustees. The properties are the Washoe, Poulin, Pacific, Oden, Limitation, Gold Hill No. 1, east half of Blue

WATER WORKS.—Sealed proposals will be received on or before 12 o'clock November 15th, 1895, for the construction and completion of certain additions to the existing water works, owned and controlled by the City of Seattle. The said additions include, in general, the supply from Cedar River, reservoirs and portions of the main line of the service system in the city. The contract to be let will embrace the following general items of construction: Head works on Cedar River, consisting of a concrete dam, 100 feet high (see page 2); Settling Basin, Pressure Pipe to City, of 48-inch diameter, 28.1 miles in length; of which 6.4 miles are to be riveted steel and 22 miles to be stave-pipe banded with steel bands $\frac{3}{4}$ inch in diameter. High-service Reservoir in City, capacity 20 million gallons. Low-service Reservoir in City, capacity 20 million gallons. Auxiliary High-service Steel Stave Pipe, 30 feet diameter by 60 feet high, incased in Kansone concrete. Pumping Main to Stand-stand, 30-inch Steel Pipe, 10 miles in length. 30-inch Kalameln Pipe, 36-inch Stave Pipe, connecting reservoirs, about one mile in length; 30-inch Stave Pipe, 3000 lineal feet, waste from High-service Reservoir to 18-inch Riveted Steel Pipe, 4900 feet length. Tunnel line, 10 miles in length, to the distribution system. Changing Cedar River Channel, 60,000 cubic yards excavation. Clearing, Dams and Connections at Swan Lake. Two Gate-houses, 100 feet high. The contract to be entered into will provide that payment shall be made for this work only by warrants upon the "Cedar River Water Supply Fund of Seattle," as created and established by Ordinance No. 3590 of the City of Seattle, and that the City of Seattle shall be bound against the city except as therein provided. By said ordinance 75 percent of the cash receipts of the entire city water system are involuntarily set aside and pledged to the payment of interest at 3 percent on the amount of the warrants issued for said warrants. In addition to the warrants, which will be issued in payment for the construction of said additions, the contractor will also be required to purchase at par any and all warrants which shall be issued by the City of Seattle for the amounts as shall be required to pay for any real estate, rights, easements or privileges necessary for the prosecution of the work of construction and the general improvement of the water works hereinafter provided for by the City of Seattle. In connection with said additions; provided that the amount of the warrants thus required to be purchased by the contractor shall in no case exceed the sum of Sixty-four Thousand (\$64,000) Dollars. Each warrant shall be payable to the order of the City Comptroller, for a sum not less than five (5%) percent of the bid, and no bid will be considered unless accompanied by said sum of money. The amount of the warrants to be entered into a contract and furnished as a bond for the amount required by the City Charter and the laws of the State of Washington, within ten days after being notified of the award of the contract, shall be the amount of the bid, and the amount fixed therein will be forfeited to the city. No person is eligible as a bidder who has within two years prior to the letting of said contract made default in payment of any just claim for any money due him by the City of Seattle, or who has been furnished pursuant to any such contract as herein advertised, or who within said two years failed to complete any such contracts. Special attention is called to Article XX of the City Charter, as now in force, relating to hours of labor, and to Article XIII, Section 31, Subs. 1 and 2, relating to bonds and sureties. All bids must be made in accordance and comply with the plans and specifications hereto attached, and in compliance with Ordinance No. 3590. The City of Seattle reserves the right to reject any and all bids. Proposals must be indorsed on envelope "Bid for Constructing Certain Additions to the Water Works of the City of Seattle." By order of the Board of Public Works.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

For Prospecting Purposes
or Underground Work,

USING COMPRESSED AIR.

HOIST FOR PROSPECTING.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done FIFTY PER CENT cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

VULCAN ROPEWAY

— WITH —
AUTOMATIC ORE LOADER AND
AUTOMATIC DUMPING DEVICE.

For Conveying
Ore, Cordwood,
Etc.

EMPIRE, NEVADA, April 17, 1898.
Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.
Yours very truly,
J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 27, 1898.

SILVER.—London, 25d; New York, 61; San Francisco, 60½; Mexican Dollars, 47½@47¾. New York exchange, sight, 17½; telegraphic, 20 cents premium.

The yellow man with the white metal is still in evidence as regards the white man with the yellow metal.

Specie shipments from San Francisco during September were: To Hongkong, \$927,512; to Honolulu, \$77,000; to New York, \$6,513,109, a total of \$7,562,671, against \$3,410,152 in September, 1897. Of this amount \$6,196,335 was gold, against \$1,259,040 in the same period of 1897. For the first nine months of 1898 the shipments aggregated \$39,396,245, against \$30,347,537 in 1897.

LEAD.—New York reports "steady;" \$3.65 bid, \$3.70 asked. The firm naming the settling price for mines and smelters quotes lead at \$3.50. Local, pipe, 6@6¼; sheet, 6¼@7c; pig, 5¼c; bar, 6c.

COPPER.—New York reports Lake unchanged, \$12.37½@12.50. Boston reports that on the 21st the Quincy M. Co. sold a carload of copper at 12½c per pound, and expects to get higher prices at its next copper sale.

IRON.—American, soft, \$21 and \$23 per ton; Scotch, \$23.50.

SPALTER.—5¼@5½.

TIN.—Menlo Roofing, redipped, \$7; English, to arrive, \$4.50; Pig, 18c; Bar, 19c.

ANTIMONY.—10, 10½.

BABBITT METAL.—10-12-14—best 16c.

QUICKSILVER.—Domestic, fair demand, \$41.50; export, \$37.00@37.50; carload lots, special rates; New York, \$40.

POWDER.—F. O. B. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1* 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. Obituary.

CHARLES P. WICKS, president of the Colorado Miners' Bureau of Information, died of acute pneumonia in Denver, Colo., last week. The Bureau of Information is closed. For some time it had been kept open at the individual expense of Mr. Wicks.

COL. J. L. COLES, who for many years has been identified with mining interests in Idaho and California, particularly in and about Soulsbyville, Cal., and who a few months ago was one of the purchasers of the Zantgraf mine at Newcastle, Cal., died last week at Coronado Beach, Cal.

HENRY PICHOR, a well known mining man, died in San Francisco on the 24th inst., aged 62. He was a native of Switzerland, and had lived forty-four years in California, prominent in hydraulic mining enterprises, and for twenty-five years secretary of the North Bloomfield Mining Co.

Recently Declared Mining Dividends.

Modoc, Colorado, 2 cents per share, \$10,000; Dec. 25.
Mammoth, Utah, \$20,000; payable Oct. 31.
Golden Cycle, Colorado, \$15,000; Oct. 25.
El Dorado Leasing Co., Colorado, \$1000; payable Nov. 1.
Moon-Anchor, Colorado, 7½ cents per share, \$45,000; Oct. 20.
Sacramento, Utah, \$500; October 25.
Modoc, Colorado, 2 cents per share, \$10,000; Oct. 25.
Strong, Colorado, \$25,000; payable Nov. 1.
Anaconda M. Co., Montana, \$1.25 per share, \$1,500,000; payable Nov. 1.

Recent Mining Incorporations.

Manook Con. G. Placer M. Co., San Francisco; capital stock \$100,000, subscribed \$50,000; W. J. Barry, E. E. Kelly, A. Geautit, J. O'Keefe, T. C. Ganey.

Star Gulch M. Co., San Francisco; capital stock \$20,000, subscribed \$50; R. H. Blake, L. R. Hare, F. Reichert, J. H. Barnard, A. J. Robinson.

The Fortuna Placer M. Co., San Francisco; capital stock \$100,000, subscribed \$700; W. P. Burke, A. P. Haws, L. T. Haws, C. Wetherbee, G. F. Thompson.

Commercial Paragraphs.

THE Pelton Water Wheel Company has under contract three pipe lines for electric power transmission plants in Mexico, aggregating some 6000 feet in length and weighing upwards of 400 tons. These lines are from 40 to 48 inches in diameter and are made of mild steel varying from ½ to ¾ inch in thickness, in proportion to the pressure it has to sustain at various points on the line.

Books Received.

"Lecture Notes on the Theory of Electrical Measurements." W. Anthony, 12 mo., pp. 90; designed as an effective aid to students. Jno. Wiley & Sons, New York City; \$1.

Mines or prospects operated on contract to purchase, or under lease on fixed royalty or percentage. MONEY loaned, mines, MINING companies organized, their property exported, financed and managed. MINES, prospects, mineral lands, mining securities, contracts, bonds, stocks, leases and options bought and sold or negotiated. EXAMINE mines, prospects and mineral lands as to their value, method of working and condition of their titles. Assay and chemical work done.

Assessment Notices.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of October, 1898, an assessment (No. 14) of one-half of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 1204 Claus Spreckels building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 31st day of November, 1898, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 11th day of December, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. J. CRAWFORD, Secretary.
Office—No. 1204 Claus Spreckels Bldg., San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of September, 1898, an assessment (No. 13) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 1204 Claus Spreckels building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of October, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 1st day of November, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. J. CRAWFORD, Secretary.
Office—Nos. 1204-11 Claus Spreckels building, San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of September, 1898, an assessment (No. 15) of 2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 31st day of October, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of November, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CHARLES BOVONE, Secretary.
Office—217 Sacramento street, San Francisco, California.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of October, 1898, an assessment (No. 21) of three (3c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 106 Leidesdorff street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of November, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of November, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CALVERT MEADE, Secretary.
Office—106 Leidesdorff street, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3rd day of September, 1898, an assessment (No. 11) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 227 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of November, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 6th day of December, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
F. MEYTMANN, Secretary.
The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22nd day of August, 1898, an assessment (No. 4) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 916 Market street, Room 57, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3rd day of October, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 31st day of October, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
GEO. W. FLEISSNER, Secretary.
Office—No. 916 Market street, Room 57, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the National Cons. Mining Co., the day of delinquency of the above assessment is postponed to November 1st, 1898, and the day of sale to FRIDAY, November 25th, 1898.

GEO. W. FLEISSNER, Secretary.
Office—No. 916 Market street, Room 57, San Francisco, California.

To Our Customers and Friends on the Pacific Coast:

Through frequent complaints made to us, we have learned that unprincipled and dishonest dealers on the Pacific coast have counterfeited our trademark numbers and substituted inferior, spurious goods as ours, when ours were distinctly ordered, thus defrauding the customers and injuring our trade and reputation.

Our goods are acknowledged to be the best, and are fully warranted by us, and are marked with our name or initials or with our well-known trademark and catalogue numbers.

We request direct notice if any goods alleged to come from us, or bearing our trademark or numbers, prove to be other than the best, and perfect in every respect, as we will follow up and expose such frauds for our customers' and our own protection. We have no exclusive agents on the Coast, but our goods are obtainable from all respectable dealers in drawing materials, stationery, hardware, artists' material, etc. Respectfully,

Cost of Tunneling by the Melones Mining Company on the Mother Lode in Calaveras County, Cal., With Comparison of Cost of Tunneling at the Hogsback Mine in Placer County, Cal.

Written for the MINING AND SCIENTIFIC PRESS by W. C. RALSTON.

The property upon which this work has been done belongs to the Melones Consolidated Mining Company, and is situated on the mother lode of California,

crosscuts were run and a large body of ore developed which showed a milling profit.

It was deemed advisable by the Melones Mining Company, who hold this property under bond from the Melones Consolidated Mining Company, to run a tunnel and develop this body of ore at a greater depth. An option was obtained upon the South Carolina mine, which adjoins the Melones Consolidated Mining Company's property on the south, and

feet in the clear, the grade of the tunnel being 3 inches to the 100 feet; water drain carried on right hand side of track.

Twelve-pound steel rails were used, gauge of track 22 inches, ties 4x6-inch timber placed every 3 feet; walking plank in most all of the tunnel 2x20 inches. The air compressor, which was used in the work, was an Ingersoll-Sargent, class "B," 12½x14 piston inlet, with a pulley which was belted to a

on Carson Hill, near Robinson's Ferry, and adjoins on the south the Morgan mine.

The mother lode of California extends for a distance of over 150 miles in length through several counties, with a strike of northeast and southwest generally. Three veins comprise the main mother lode, commonly called the east vein, middle vein and west vein. The Melones property is situated upon the east and middle vein, and has respectively 1407 feet on the east vein and 5166 feet upon the middle vein. A shaft had been sunk on the Reserve mine, which is on the east vein, and within 230 feet of the Morgan mine. At the bottom of this shaft drifts and

on the same east vein, upon which a tunnel had been run a distance of 1080 feet. This tunnel, which is a crosscut to the country, was cleaned out and continued to a point within 40 feet of the Morgan mine and passed directly under the Reserve shaft. The tunnel is located 425 feet lower than the 200 level of the Reserve shaft. The whole distance to be run of the main crosscut was 3003 feet, when other crosscuts and drifts were to be run to open up the reserves of ore at that level. The South Carolina tunnel had been run by hand a distance of 1080 feet. This tunnel was continued, but with machine drills, and the size increased to 7x8

main shaft, on one end of which is a 5-foot solid disk Pelton water wheel. On this same shaft and on the other end is a pulley which was belted (when we had no water) to a Nagle engine 12x16, class "A" horizontal. From this shaft was also operated a number 4½ Baker blower. The blower was run as an exhaust, using 11-inch pipe, a pipe line, 1100 feet in length, taking water from the Union Water Company's ditch, through 10-inch No. 16 iron pipe for one-half the distance, and 8-inch No. 12 iron pipe at the bottom; all pipe double-riveted and tarred. This pipe line gave us 200 pounds pressure, effective under a head of 470 feet. The

compressor was started on Jan. 10, 1898, and machine drilling commenced.

On Sept. 24th the crosscut tunnel, with drifts and other crosscuts, (the same size as the tunnel), had reached a length of 2608.5 feet. During these 36.4 weeks no time was lost, save two days in the early part of July. During the work we made an average of 10.22 feet per day, 71.62 feet per week, and 306.88 feet per month of thirty days, nine sets of timbers only being used in the work.

The largest runs made for two consecutive weeks were 92 feet for the week ending May 28th and 90 feet for the week ending June 4th, or 13.14 and 12.85 feet per day respectively. "The largest runs made at the Hogsback mine for two consecutive weeks were 73.06 for the week ending Aug. 4, 1888, and 66.9 feet for the week ending Aug. 11th, or 10.51 and 9.55 feet per day respectively." The tunnel runs diagonally across the strike of the rock on an average at an angle of about 32°, but the strike changes at different points, from being nearly at right angles to running with the tunnel.

The rock passed through is greenstone and brown slate and heavily mineralized talc slate, filled with quartz stringers. The ground is very firm, as evidenced by the small amount of timbers used. Owing to the shortness of the bond speed was the great factor, so it was impossible to economize in men or powder. The working force when full-handed consisted of twenty-nine men, divided into three 8-hour shifts of seven men each (four machine men and three shovellers on each shift); two drivers with horses working twelve hours each; two engineers working twelve hours; one blacksmith, one helper, one mechanic and one outside man, working ten hours. The drill men were kept constantly at work in the face, and to save time an experiment was tried of using the two machine drills on one column placed horizontally across the tunnel, as near the top as possible. This permitted the machine men to get at work immediately after blasting without waiting for the dirt to be shoveled back from the face, so by the time the shovellers had the rock cleared away the machines were able to be swung around under the bar to put in the center cut and middle side holes. After these holes were drilled, long drills were inserted in the machines; they were then swung to a vertical position with the drills resting on the bottom of the tunnel, holding their own weight and also that of the column when the wedges were removed from the same. The whole weight now being on the drills, the machines were cranked down until the bar was in a position low enough to drill the balance of the holes. The column was then weighed up again,

the machine swung in position, and drilling completed. In medium hard ground this was found very satisfactory, but in hard ground no time was saved. No attempt was made to save powder, figuring that powder was cheaper than labor, and the finer the ground was broken the easier and quicker it was handled. No. 2, 40 per cent Hercules powder, was used during the entire work, with one stick of No. 1, 60 per cent, being used in the bottom of each hole, and which gave remarkably good results. The whole face was blasted at one time, the center cut having shorter fuse so that it would break first.

Water was freely used while drilling, conveyed to each machine through a 1-inch hose, under 200 pounds pressure. After blasting, the full force of water from the 2-inch water pipe was turned into the face in the form of a spray, and in this way the fumes were carried away and the atmosphere cooled, enabling the men to return more rapidly to work. An improvement was made, to save time in changing drills, by having the two nuts riveted on the U-bolt, and a key seat cut in the upper end of it with a wedge inserted, having a small lug on it to prevent its being knocked out. This wedge was put in the U-bolt with the taper side towards the end of the chuck, so that, after it was driven home, the constant hitting of the drill would keep tightening it. A couple of blows with a hammer loosened it, releasing the drill, thereby saving much time which is lost in loosening and tightening the two nuts, besides obviating the delays caused by the stripping of the threads, which necessitates a new bolt.

The king bolts commonly sent out with machine drills are made of too light material, and the thread of them, being fine, is easily stripped. At the Melones we used king bolts made of the best 1½-inch iron, with a No. 4 thread deeply cut, and using on this a 2-inch square nut. As a result, no accidents happened by machines falling, which is occasioned by the stripping of the threads.

Two Ingersoll Eclipse drills (old style) 3½-inch were used, one extra drill being kept in the shop. For 2608.5 feet of tunnel, the total cost of extras for these three machines amounted to only \$91.65.

The total cost of repairs and extras during the 8.5 months of almost continuous work for the compressor amounts to \$21.32. In the record herewith appended the facts are presented without any attempt at changing the conditions and with the hope that it will be the means of encouraging mining men generally to keep accurate records of their work, so that it will prove of assistance to those who contemplate doing similar work.

The record of 306.88 feet per month (of thirty days consecutively) may have been excelled, but when it is taken into consideration that this work was started at the end of the tunnel already run a distance of 1080 feet it makes the record some better.

Having run a tunnel (but not quite so long) at the Hogsback mine in Placer county nine years ago, and having kept a record of that work, I thought it would be of interest to readers of the MINING AND SCIENTIFIC PRESS to compare the work.

The tunnel in Placer county ran diagonally across the strike of the rock, at an angle of about 20°, which was composed of alternate stratas of slate, diorite, and white, barren quartz.

The regular force of men, consisting of twenty-one all told, divided into three shifts of five men each, working eight hours; two engineers working twelve hours; two drivers and horses working twelve hours, and two blacksmiths working ten hours.

In comparing the foregoing several differences are apparent. The small amount of carloads per week at the Melones as compared to the Hogsback is explained by stating that the ground at the Hogsback mine was blocky and broke big, necessitating handling much more rock than was necessary.

The difference in cost of labor per week is explained by stating that at the Melones mine of the twenty-one miners only six receive \$3 a day, the balance \$2.50 a day, carmen \$2, whereas at the Hogsback mine everybody was paid \$3 a day. It will also be noticed that it required twice as many holes to be drilled in the face of the Melones mine than it did at the Hogsback mine, as the ground was much harder and more difficult to break. During the progress of the work at the Melones mine not a single man was maimed nor did any accident occur.

To Mr. B. Deleray, the superintendent of the mine, is due the credit of the splendid results attained.

W. C. RALSTON, Manager.

San Francisco, Oct. 3rd, '98.

"No. 2000."

This is the two-thousandth issue of the MINING AND SCIENTIFIC PRESS, being No. 19, of the 77th volume. It is vouchsafed to very few such publications as this to announce the appearance of its two-thousandth issue, and in making this brief chronicle of so interesting a fact in the mining world, it is only to say that great as have been the advances in the mining and metallurgical world since this paper began publication in 1860, and in which it has had so prominent and honorable a part, it is believed that the coming years will bring at least equal progress and advancement in mining—the world's basic industry—and, as in the past it has been our pleasure and our privilege, so, in the future, it will be our province and our purpose to aid in the advancement of the great industry of which the MINING AND SCIENTIFIC PRESS has been so long the chief exponent.

At the coming session of Congress a Colorado effort will be made to secure the passage of a law granting contestants in the matter of conflicting mining claims the right to compromise the case without impairing their rights. It has been customary in courts to permit such action, on the principle that each could thus avoid expensive litigation, and yet preserve his rights of discovery, and such a course has often been recommended by the attorneys. The Commissioner of the General Land Office has ruled that whenever suit was brought it must be a fight to a finish; he holds that if a contestant has a right to a portion of the ground, he has a right to all of it, and cannot compromise the case pending a decision from the land office at Washington, D. C.

Concentrates.

THIS is the 2000th issue of this progressive publication.

The specific gravity of quartz is 2.65; its weight 165 lbs. per cu. ft.

THE Idaho Antimony Mining Co., Kingston, Idaho, employs twenty-five men.

TWENTY days' receipts during October at the Denver, Colo., mint foot up \$1,342,022.63.

SAN MIGUEL COUNTY, Colo., gives employment to about 1500 men in mines and mills.

In May, '84, the flow of water from the mouth of the Sutro, Nev., tunnel was 49,694,800 gallons daily.

EIGHT mining companies in the Cripple Creek, Colo., district will pay dividends of \$181,750 during the present month.

By an explosion of dynamite in the Trio mine at Jamestown, Cal., last Monday, D. Stewart and F. Calkings were killed.

MINERAL COUNTY, Colo., in 1897, produced \$218,000 gold, 1500 tons of lead, 2500 tons of zinc and nearly \$2,000,000 in silver.

TO FURNISH light and power to the mines of the district, an electric plant is being built at Central City, Colo., at a cost of \$300,000.

WEIGHT for weight in making steam, wood has four-tenths of the evaporative power of coal: will do less than one-half coal's work.

In the pyrites mines near Bakovici, Bosnia, a California stamp mill and Frue vanners were erected last February with satisfactory results.

The notice of an application for a patent to a claim, should, in stating the names of adjoining claims, include unsurveyed as well as surveyed claims.

In '97 Los Angeles Co., Cal., led the other fifty-six California counties in the production of brick clay, gypsum, infusorial earth, serpentine and petroleum.

ORES containing coarse gold not easily soluble in cyanide should always have that portion extracted by concentration or amalgamation before leaching.

THE Idaho Springs, Colo., Gazette says that though that district is operated mainly by local capital, the output is heavy and three sampling works are kept busy.

GIBBONSVILLE, IDAHO, wants a custom mill, or reduction plant, to handle base ores, which are said to exist in several well developed properties in that neighborhood.

ORE crushed by steam stamps usually makes less slimes than when gravity stamps are dropped thereon, the pulverized ore being forced more rapidly through the screens.

FROM the Haggerty mine in the Grand Encampment district, Wyoming, was taken a 1200-pound piece of copper ore, which was last week placed on exhibition in Denver, Colo.

SEATTLE, Wash., papers report a shortage of money and consequent disappointment in inability to secure reduced rates from transcontinental roads on the part of east-bound men returning from the Klondike.

SIZE of required wire and consequent cost varies with required voltage and distance of transmission. To transmit 200 H. P. five miles the cost of erection, complete, of that length line should not be over \$2000.

M. J. RIXOFF of London, England, representing an English company, is at Leadville, Colo., with a view to erecting an electric plant to furnish light and power to the mines and smelters of the Leadville district.

HORSEBACK prospectors are not as common as heretofore. The men who "rode all over that country and found nothing" are giving place to the patient, practical prospector who is not in too big a hurry to miss a good thing.

THE blanket sluice has not gone out of use, and may still be found doing duty in a limited but faithful way, saving fine amalgam when properly set and frequently washed, but not of much modern value for concentrating sulphurets.

ABOUT as large a drum as "Concentrates" knows of is the double-cone drum in the hoist of the Tamarack, Houghton, Mich. It is 36½ ft. diam., weighs 340,000 lbs., shaft diam. 28½ ft., length 33½ ft., carries 7000 ft. 1½ in. cable on each side.

DURING October 500,000 ounces of silver were deposited at the San Francisco Mint by the mine owners, who withdrew the same amount from the mint in Philadelphia, thus saving express charges on the transportation of the bullion across the continent.

THE Potosi & Rio Verde Ry. Co. is a New York concern, with a \$200,000 capital, incorporated to build an electric railroad from San Luis Potosi, Mexico, 66 miles to the Rio Verde mining district, to carry ore from Rio Verde to the Potosi smelter.

FOR the first time in its history, California was surpassed in '97 in its annual production of gold by another State, and the United States by another nation. In '97 Colorado produced more gold than California, and South Africa more gold than this nation.

A GOOD model of a 10-stamp mill complete, on a scale of one inch to the foot, at the California State Mining Bureau, Pioneer Bldg., S. F., shows the whole mode of operation—a miniature presentation of the detail of a mill at the Rising Sun mine, Placer Co., Cal.

THE '97 silver production, coining value, of California, Colorado, Idaho, Montana, Nevada, South Dakota, Texas, Utah and Washington was \$65,724,251. The remainder of the U. S. produced \$3,912,921; of this \$3,744,067 was from Alaska, Arizona and New Mexico.

A MAN is chiefly charcoal and water, and cannot exist in heat that consumes the charcoal in spite of the water. Animals, two-legged and otherwise, with silicon instead of charcoal, may inhabit other earths in stellar space, of a higher temperature than this terrestrial ball.

THE constitutionality of the new mining law of California has not been passed upon by the State Supreme Court. In July, '97, the law was held to be unconstitutional by the Superior Court of Mono Co., and in April, '98, a contrary opinion was given by the Superior Court of Shasta Co.

THE greatest dividend-paying mine in British Columbia is the Payne, near Sandon, owned by A. W. McCune of Salt Lake, Hoge & Brownlee of Butte and Anaconda, and S. McDonald of Spokane. The mine, as locally reported, yields a

profit of \$1,250,000 annually and has paid \$1,800,000 in dividends to date.

THE idea prevalent in some quarters that the reserving of forest sections by the Government is prejudicial to miners is not in accordance with the facts. Such reservations insure to the lasting benefit of the mining industry, and no real prospector or miner is hampered or injured thereby.

ANSWERING four questions of similar import: Since July 1st, '98, the Land Department considers each placer location a separate mining claim in patent proceedings, upon each of which is required \$500 in work or improvements. One application will do for contiguous or adjoining claims.

THE aggregate value of mineral products that passed through the custom houses of the Republic of Mexico the last fiscal year of 1897-98 was \$91,250,000, an increase of \$10,500,000 over the previous year. Of this, the amount of silver is stated to be \$67,000,000; gold, \$16,000,000; copper, \$4,700,000, and lead, \$3,000,000, reckoned in Mexican silver.

A FAN at the Wilkeson, Wash., Coal and Coke Company's mine is 10 feet in diameter, and, when making 170 revolutions a minute with a water gauge of 1.7 inches, puts 116,810 cubic feet of air per minute in circulation. When traveling 235 revolutions per minute with a water gauge of 2.5 inches, it circulates 142,290 cubic feet of air per minute.

GOLD may be induced to deposit from its mineral salt to the metallic state on such suitable base as iron sulphide, and mineralogists have thus manufactured natural looking specimens of "gold quartz" from rock which by previous assay contained no trace of gold. Such dexterity is, however, not wholly commendable, suggesting proficiency in the ignoble art of "salting."

ONE thousand dollars in standard silver dollars weigh 859.375 ozs.; the same amount in halves, quarters and dimes weighs 893.75 ozs. This is due to the Act of 1853, under which these smaller coins are minted. Silver was then comparatively high, and foreign governments drained the U. S. To stop exports the standard was lowered and has remained so for forty-five years.

M. JAHR of the Breslau Mining Department has devised a theodolite for underground surveying, in which the verniers are lighted by incandescent electric lamps supplied with current from an accumulator slung from the top of the tripod, and connected with the instrument in such a way that when the telescope is turned in a vertical or horizontal plane the current is not interrupted.

IN the Koenig mine, Neuenkirchen, it has been found that the comparative cost in underground work of compressed air, electricity and water pressure was as follows: Installation of compressed air, \$3750; electricity, \$3900; water power, \$3000; working cost for 66 H. P. and 300 days, compressed air, \$875; electricity, \$750; water power, \$650. The water pressure available was 150 yards.

REGARDING the clippings this week from Butte, Montana, Spokane, Wash., and Los Angeles, Cal., it is desired to courteously say that this paper is too much taken up in the constant endeavor to keep mistakes out of its own columns to attempt the correction of alleged or manifest errors in those of any of its contemporaries. No one is infallible, and, possibly, the writers or publishers of the excerpts referred to believed them.

A COLORADO assayer asks a practical question, which, after considerable inquiry, "Concentrates" is unable to satisfactorily answer. He questions: "Is an electric furnace for making crucible assays practicable?" It would seem that where fuel is dear, electric energy cheaply procurable and a large number of daily fusions made, it should be, but know of no one manufacturing such a device. Probably some of our readers can supply the information.

POTASSIUM PERMANGANATE is successfully used in New Zealand, says Dingle's *Polytechnischer Journal*, for gold extraction. The finely crushed ore is ground with common salt and sulphuric acid and the permanganate added to the mixture. Hydrochloric acid is first formed; with this the permanganate yields chlorine, which at the moment of its liberation dissolves the gold. It is claimed that the process extracts the gold completely. It can be used with copper-containing ores.

TWO specimens from Georgetown, Cal., are not diamonds, though diamonds have been found in that vicinity. Full directions for diamond hunters and the finders of diamonds were published in the issue of Feb. 16, 1895. California diamonds are not uncommon. They are found in the hard, compacted gold-bearing gravel occupying ancient river channels capped with lava. Louis Glass of San Francisco wears California diamonds found by him while superintendent of the Spring Valley hydraulic mine, Cherokee, Butte Co., Cal.

IF October's record is kept up during November and December the subscriptions during the last three months of '98 to this paper will exceed in number that of any similar period in this journal's history. During October there were received in the business office 311 new subscriptions. When it is considered that during October a fierce political battle was going on in a great part of the region whence these subscriptions came, it will be seen that however much the minds of mining men may be distracted by political excitement they want this paper.

TO FIND the necessary size of valve for steam boiler, $\frac{1}{2}$ the number sq. ft. of grate surface of boiler is the number sq. in. of required valve area. To find number sq. ft. heating surface in a horizontal tubular boiler, first reducing all dimensions to inches, multiply two-thirds of the circumference of the shell by its length; multiply the length of the tubes by their combined circumference, subtract from two-thirds of the area of both heads the combined area of the tubes, add the remainder to the sum of the tubes and shell, divide total by 144; the quotient will be the number required.

FIFTY-SEVEN DAYS remain to do required annual assessment work for '98. In some regions assessment work is done by contract. Some man who keeps posted on claims, especially those belonging to absentees, by lively rustling gets the job to keep alive forty or fifty unpatented locations. He hires men and figures on an average profit of \$35 per claim. The temptation to sharp practice sometimes causes less than \$100 worth of work to be put on each claim, which tends to make trouble later on. The better way is to do it oneself or see personally that it is done legally, unless one is "sure of his man."

SINCE the 1st of last July, all applications for U. S. patents for mining claims must be accompanied by an affidavit that \$500

worth of work has been expended for each claim. In case of a group of contiguous claims, if it can be shown that the work done on any one of them went to improve or develop the entire group, such will be admissible, provided the affidavit shows that on such one claim the work or improvement aggregates as many times \$500 as there are claims in the group for which patent is desired. For instance, if the application be for say five claims, an aggregate of \$2500 in work or improvements must be shown to have been expended: such \$2500 can have been put entirely upon any one of the five, provided it be shown that such amount tended to improve or develop the whole five.

MANGANESE ORE is produced in Alameda county, Cal., which last year produced 504 tons, worth \$4080; in '96, California produced 284 tons, worth \$3415; in '95, 535 tons, worth \$5400. It has also been mined in San Joaquin county. The world's production is about 500,000 tons annually, about one-half of which comes from Russia. It is also imported from Germany, Chili, France and Cuba. It is plentiful in Colorado, Utah and Arkansas, but the ore can be delivered cheaper in New York from Cuba than from any one of the three last-named sections. Its principal use is in iron and steel manufacture, and as a re-agent in the manufacture of bromine and chlorine (manganese binoxide). In '97 Pott & Batum in the Caucasus exported 210,106 long tons manganese ore, of which 42,300 tons came to the United States.

THERE are two kinds of hydrides—those in which the hydride is in solution with metal, and others formed at higher or lower temperatures, and which appear to be of chemical and determined combination. To this latter class belongs the hydride of calcium, similar in results to crystallized carbide of calcium as prepared in electric furnaces. Moissan describes, in the *Comptes Rendus*, a hydride of calcium of the formula CaH_2 , formed by heating crystallized calcium in a stream of dry hydrogen. It is a hard, white crystalline body, stable in dry air, even at a red heat, but burning before the oxy-hydrogen flame. At ordinary temperatures it is not very reactive, but when heated reacts readily with most of the negative elements. It is a powerful reducing agent, decomposing cold water with great violence, with the formation of calcium hydroxide and liberation of hydrogen. In this hydride the hydrogen thus seems to resemble the carbon in calcium carbide and the phosphorus in calcium phosphide.

THE Anaconda Copper M. Co., in Montana, have about 5000 cars fitted with a self-oiling car axle. The axle is made in halves, being divided at the center, and both wheels being pressed on. A cast iron sleeve is used as a support for the axle as an oil reservoir. This sleeve is bored to fit the axle, the center part being counter-bored to provide oil space. The sleeve enters about 1½ inches into the hub of each wheel, with a sufficiently close fit to prevent the loss of oil. The object of having the axle divided in the center is mainly to allow for variations of travel in passing around curves, so as to be able to press the wheels separately on each half-axle. The half-axle is slightly tapered at one end; the other end is provided with a groove, in which is a small fork-shaped brass casting, serving to hold the axle in position. At the center the sleeve is enlarged, and has an opening to let the two forks drop in. A steel cover is hinged over this opening, serving to retain the forks in position and to keep out dust and dirt. The cover can be slipped to one side to permit oiling, or, when it may be necessary, to take out the forks and remove the wheels and axles.

THE claim for "the Stephens process," at Salida, Colo., is that it will treat sulphide as well as oxidized ores, and make roasting unnecessary, and that "by electrical precipitation" it will treat copper ore "as easily and as cheaply as it will gold or silver ore." According to the "professor" who has charge of the laboratory experiments, "the practical working of the process is on similar lines to the chlorination process, but the gases evolved by the chemical combination of the solid and liquid chemicals used are more potent in solvent properties. The ore is reduced to a certain degree of fineness (determined experimentally) and then charged into lead-lined iron cylinders, the chemicals and water are then added, the cylinders sealed and left to evolve. After a certain time has elapsed (determined by laboratory experiments) the barrel is opened, the charge washed several times by decantation, then the ore is rinsed out and charged on a filter bed, the precious metal now being in a liquid state. Experiments performed in our laboratory have proven that several precipitants may be used for the recovery of the gold, viz.: Sulphureted hydrogen, sulphide of copper and ferrous sulphate. This green vitriol is easily made from scrap iron and sulphuric acid; both are inexpensive materials." The professor thinks it possible he "may modify the precipitation according to the results of investigation of electrical methods."

A "TRANSFER ORNAMENT" is any design made the way it is desired as a design for the purpose to be secured. For instance, assuming that one wants a design for the decoration of a wooden covering to machinery: The painter or designer gets up some appropriate combination that will look well. He paints the design by hand first, then such design is passed to the engraver. From the engraver the design goes to the printer, when each color is printed on an exactly-registering press, so arranged that the colors fit as to shading, etc. Such a print is usually a varnish or sizing print. This print receives a layer of metal leaf, and, after clearing away the surplus, appears upside down on the paper. What gives such a print the name of "transfer ornament" is the fact that it is so printed upside down on a chemically-prepared paper. This paper is porous and has on its face a coat of a chemical preparation, so that water placed on the back will soak through quickly. When the ornament has been printed on this paper, has been given a coating of varnish over the ornament, and the varnish has been allowed to set for a few minutes to get tacky, the paper ornament and all is then placed in proper position and pressed firmly against the woodwork. All that is necessary to transfer the ornament is to wet the paper on the back. The water soaks through the paper and softens the chemical coating on the paper, which in turn releases the ornament printed on it, and, the varnish being on the other side of the ornament, it sticks to the woodwork. When the paper is lifted off appears, in brilliant coloring or in gold or silver, as desired, the design. It is necessary to take a little benzine in a sponge and wash over the ornament quickly, washing away all the surplus chemicals and surplus varnish that transferred with the design. To prevent being scratched after twenty-four hours it should have a coating of varnish. The paper acts as a conveyor: the ornament is printed on the coating and not on the paper.

Occurrence and Treatment of the Carbonate of Soda Deposits of the Great Basin.

Written for the MINING AND SCIENTIFIC PRESS by S. A. KNAPP.

Comparatively little attention has been paid to the natural sources of wealth of the great basin in the form of chemical deposits, unless same were extremely rich in some of the more valuable salts. The borax prospector has examined most of them, but unless they boiled out rich on the first test they were passed by. Soda was never considered of any value except for the purpose of working cotton ball or borate of lime, and the dry deposits of it were condemned as alkali flats and considered as of no possible use, and the lakes unfit for use. Until within the past ten or twelve years practically nothing was done towards developing same, and then only in a small way, the first work of any importance having been done at Ragtown, Churchill county, Nevada.

The soda deposits, some in solution and others as dry deposits, doubtless desiccated lakes, are numerous all through the great basin, but the carbonate deposits of economic value seem to be confined to the eastern skirts of the great Sierra Nevada range of mountains, and extending northerly and southerly along the base of the mountains, both in California and Nevada. As we go easterly from this line the carbonates decrease and the sulphates increase, until, in Wyoming, on the eastern limit, we find the deposits almost entirely sulphates. The various deposits differ in their chemical composition very widely, and even within any given deposit the proportions in which the salts exist in different portions of the deposit vary, the general character of the salts, however, being a mixture of chloride of sodium, carbonate of soda, bicarbonate of soda, sulphate of soda, with occasionally some chloride of potassium, borate of soda and borate of lime. In the dry deposits these salts are mixed with more or less sand and dirt. As but little call, except for local needs, is had for chloride of sodium, but little attention is paid to saving it. Sulphate of soda is likewise of but little practical use and is disregarded, the only salts considered as worth saving under present conditions being the carbonates and bicarbonates of soda and the borates of lime and soda. As the borates are local and not present in all the deposits in sufficient quantity to warrant treatment for their recovery, we will consider at present only the treatment of the material for the saving of the carbonates.

The treatment varies with the material and the chemical composition, and in the case of lakes or deposits in solution is divided into two classes: 1. The hot weather, or summer, soda process. 2. The cold weather, or winter, process. The hot weather process has for its foundation the presence of bicarbonate in the solution, as well as carbonate, and the chemical fact that in dense solutions one molecule of bicarbonate will unite with one molecule of carbonate and form sesqui-carbonate, also known as trona or urao, which precipitates.

To obtain these salts in a pure state, other chemical facts are taken advantage of, to wit, that salt or chloride of sodium will not precipitate unless the density of solution rises above 32° Baume, and that sulphate will remain in solution up to 34° Baume, providing the temperature of the solution remains above 75° Fahr. The method employed is to pump solution into vats with clay bottoms and sides and evaporate same by solar heat, and accumulate solutions at low density until warm weather approaches, when, solution being conducted to crystallizing vats, the density is allowed to run up by evaporation to the neighborhood of 29° or 30° Baume. When the sun's heat is sufficient to keep temperature up to 75° or above the density is run up still higher, and crystallization commences and strong solution is added from time to time and waste or exhausted solution is run off. During the warm weather this method is continued, and gradually there accumulates a hard cake or deposit of the sesqui-carbonate of soda, which at the end of the season varies from a few inches to as high as 12 inches in thickness over the bottom of the vat. When the season is over and cold weather approaches, the cake of sesqui-carbonate is broken up, taken out of vats, washed and piled up to dry in the air, the composition of the material being, if work is carefully done, as follows:

| | |
|--------------------------|---------|
| Bicarbonate of soda..... | 36.46% |
| Carbonate of soda..... | 45.86% |
| Chloride of soda..... | .32% |
| Sulphate of soda..... | 1.25% |
| H ₂ O..... | 16.16% |
| Insoluble..... | .02% |
| Chatard..... | 100.07% |

Often the sulphate and chloride are still lower than above figures.

When, after drying, this material is subjected to heat in a properly constructed furnace—revolving automatic or reverberatory—the soda parts with its water of crystallization and the excess of carbonic acid, and leaves an anhydrous mono-carbonate of soda almost absolutely pure, or soda ash, which is then ground and packed for shipment.

The cold weather process is applicable to solutions

containing carbonate of soda and chloride of soda only, and consists of evaporating solution to density of 30° or 31° and holding same until cold, freezing weather, when the entire soda contents unite with water of crystallization, forming decahydrate or sal soda (Na₂O—21.68—CO₂ 15.39—H₂O—62.93—), which falls, leaving the salt in solution, which is then drawn off and run to waste. The soda is raised from the vat and piled on protected platforms, where a free circulation of air takes place, and it gradually loses its water of crystallization. As the warmer weather approaches in the spring the piles are broken down and soda spread to dry, and the air dries it down to a mono-hydrate of soda (Na₂O—50 CO₂ 35.48 H₂O—14.52), in which form it is especially useful to soap makers and for manufacture of washing powders. By the cold weather process practically all the contents of the solution as mono-carbonate are recovered, while by the hot weather process, generally speaking, only about 25% of the available soda is recovered, it depending entirely upon the amount of bicarbonate present in the solution; but as the handling of solution is merely a question of pumping, the soda maker does not worry very much over the low extraction, merely providing more vat room and running his pumps longer.

In the working of lakes or deposits of solution the necessary conditions must be present to do so successfully, and these are: 1. Convenient beds of clay impervious to the soda solution, in which the vats are dug. 2. An altitude low enough to insure a long term of warm weather for evaporation and precipitation. 3. Convenience to transportation for providing fuel and shipment of product to market.

The following are the principal lakes or solution deposits where carbonates are present in sufficient quantity to allow working: Albert lake in Oregon; Ragtown lakes, Churchill Co., Nev.; Mono lake, Mono Co., Cal.; Black lake, Mono Co., Cal.; Owen's lake, Inyo Co., Cal. The only ones worked are the Ragtown lakes, where about 1000 tons per annum are being made, and Owen's lake, where about 5000 tons per annum are being produced. Mono lake is at too great an altitude to allow good evaporation. Albert lake is open to the same objection. Black lake is a little too far from transportation and is small.

The dry deposits are scattered along the eastern base of the Sierras, commencing near the Oregon line, where there are two; next the Double springs marsh in Esmeralda Co., Nev., property of Occidental Alkali Co.; the Hot springs marsh in Esmeralda Co., Nev.; Teel's marsh in Esmeralda Co., Nev.; Columbus & Fish lake marsh. Some of these deposits are so high in chloride and sulphate as to be economically of little value; others run high in the carbonates. As an instance, the Double springs deposit in Esmeralda Co., Nev., has an area of about 800 acres, of which 500 acres are covered with a deposit of soda of an average depth of about 6 inches. An analysis of an average sample of the crude top incrustation gives:

| | |
|--------------------------|------|
| Carbonate of soda..... | 20% |
| Bicarbonate of soda..... | 25% |
| Sulphate of soda..... | 15% |
| Chloride of soda..... | 10% |
| Sand and soluble..... | 15% |
| H ₂ O..... | 15% |
| | 100% |

This deposit is but four miles from rail transportation, being near the line of the Carson & Colorado R. R., which line also reaches Owen's lake. Beneath this top incrustation is a bed of damp clay, strongly impregnated with soda; and when the top incrustation is removed, the soda rises on the surface of the clay and gradually accumulates, in this way renewing the deposit, which up to the limit of this renewal is practically inexhaustible.

The Hot Springs marsh is about twenty miles from rail transportation; the deposit is of the same general character as that at Double springs, and of about the same area. Teel's marsh, about fifteen miles from rail, is much smaller, and the salt is not as high in carbonates as Double springs. Columbus marsh, nine miles from rail, is a very large deposit. A portion of the marsh has good incrustation of carbonate, in another portion borates of soda and lime predominate, while in others salt and sulphate of soda are in excess. Other deposits exist in Saline valley and south and east from there, but are too far from rail to be available. The only dry deposit upon which any work has been done is the Double springs deposit in Esmeralda county, Nevada. Here the method adopted was to gather the incrustation and tram same to dump of works, dissolve in hot water, settle the solution in settlers and draw the clear solution to vats for precipitation, as described in the hot weather process. The small percentage of extraction, owing to low per cent of bicarbonate present after boiling, militated against the success of the process, although considerable soda of a high grade was made. Recently a series of careful experiments have been made, and, as a result, the process will be changed, so that 85% of the available soda will be recovered, and the process be continuous winter and summer.

Briefly, the process is: 1. Gathering crude and tramping to dump. 2. Dissolving and settling to obtain clear solution. 3. Carbonating solution so as

to change all carbonates to bicarbonate, which precipitates immediately by adding CO₂ under pressure. 4. Precipitating and washing bicarbonate. 5. Drying bicarbonate and furnacing same in a retort furnace to save the CO₂ for use in carbonating fresh solution, the CO₂ being compressed and stored in receiver.

As an illustration of the purity of the product obtained by this process I give the analysis of a sample of bicarbonate produced on a large scale at Double springs marsh:

| | Double Springs Bicarbonate. | Chemically Pure Bicarbonate. |
|------------------------|--------------------------------|---------------------------------|
| Na ₂ O..... | 37.00 | 36.94 |
| CO ₂ | 52.30 | 52.36 |
| H ₂ O..... | 10.70 | 10.70 |
| | 100.00 | 100.00 |

After furnacing we have left an almost pure mono-carbonate, 97-98% carbonate of soda, which is then ground and packed for shipment. The latter portion of the process is an adaptation of the methods used in the Solvay process for production of ammonia soda, and has stood the test of long and successful use. This process is applicable to all the deposits that are sufficiently high in carbonates, and has the advantage of being under perfect control at all times, and will doubtless be generally adopted in working dry deposits.

The economic importance of these deposits can hardly be understood by those who have paid but little attention to the development of the alkali trade. The great variety of products into which soda ash enters—glass making, soap manufacture, paper making, borax manufacture from borates of lime, wool scouring, the manufacture of sal soda and washing powders, the manufacture of bicarbonate for baking powder purposes, etc., etc.—makes a heavy demand for it, which until within a few years was entirely supplied by England, our imports of ash running as high as 300,000 tons per annum, and for the Pacific coast alone as high as 25,000 tons per annum. In addition, the paper maker is gradually waking up to the fact that his caustic lye can be much more cheaply and easily made by using ash, and causticizing by lime, than to import and handle the prepared caustic, which still further increases the demand for ash, so that we may look forward to a heavy and constant increase of the demand for this product, and the despised alkali will in time take its place as one of the leading products of the arid region and the deposits be thoroughly developed.

Hawthorne, Nev., Oct. 20th, '98.

Find of Ancient Bones.

TO THE EDITOR:—In a shaft sunk at the Hancock bituminous deposit, lying northwest of Los Angeles, Cal., in the center of what appeared to be an old tar spring, near the surface, were found the bones of domestic animals—horses, cattle, sheep, etc.; at a greater depth the bones of the bear, elk and other wild animals, and resting on the shale beneath the bituminized sand at a depth of 30 feet were the bones of the *Elephas Americanus*.

During the latter part of the summer seasons in California, which are rainless, the natural grasses dry up, but owing to the slight amount of water which ascends with the bitumen, there grew surrounding these asphalt springs during the dry season green and succulent herbage.

This green herbage was the bait of the trap which tempted these herbivorous animals to their doom. With everything else dry these green herbs were an irresistible temptation. In struggling to get them the animals became mired in the tar spring and suffocated, their bones gradually sinking to the bottom.

The *Elephas Americanus* seems to be the first one that met this fate, as his bones rest upon the underlying shale below the remainder of the fossils. These springs must be very old, as it is many years since the American elephant fed upon the adjacent plains.

Los Angeles, Cal., Oct. 20th, '98. A READER.

True Heroism.

TO THE EDITOR:—If the following incident is deemed worthy of publication, you can make use of it. It is authentic. N. S. TROWBRIDGE.

Sumdum, Alaska, Oct. 8th, '98.

Heroes are found among the miners of our country as well as among our soldiers, as the following incident proves: Three men of Sumdum, Alaska, had just spitted eleven holes in the bottom of a shaft and started for the surface on the edge of a bucket. The swing of the bucket threw one of them against a timber and he was knocked off, falling to the bottom. He was not seriously hurt and retained perfect consciousness. Death in a horrible form stared him in the face. "Billy! Billy!" shouted he to the foreman; "don't leave me here to die!" "Pull that bell cord," said Billy to his companion. "I can't find it," was the reply. "Pull that cord, damn you, or I will knock you off the bucket!" The cord was pulled and the descent, then 60 feet from bottom of shaft, was made. As the bottom was approached, the engineer slowed up, as usual. Quick signals to lower, and, the bottom being

reached, the two men jumped off, and, grabbing the hurt man, put him into the bucket. Signals to hoist at full speed started them upward. The explosion occurred just as the men reached the surface and safety. Who shall say that heroism of the highest kind was not here displayed!

The Country of the Klondike.

NUMBER III. — CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by RUSSELL L. DUNN.

Pine Creek or Lake Atlin district is from location alone a more promising field for prospectors than the Shorty Creek district. It is the Lewis river basin above Lake Tagish. It is close to and easily accessible from Skaguay all the year. Like the Shorty Creek district it is above glaciation, or more exactly it is in a locality over which there has been no glacial movement, although there are glaciers above it and glacial terraces and moraines down the Lewis river from it. The placers are shallow and are the beds, low bars, and "old channels" (forming "benches") of several creeks and small gulches adjacent to Lake Atlin. The auriferous gravels contain considerable quartz float. This latter has led to the discovery of several lodes so situated that they undoubtedly contributed to the formation of the placers. Transportation is good, and machinery, supplies and men can be put into this district so cheaply that both low-grade placers and comparatively low-grade lodes can be profitably exploited.

Aside from these three districts there is nothing else yet discovered and proven of commercial value in the Northwest Territory. Most of the alleged discoveries are of the glacial moraine and terrace colors discovered in surface panning. The country, however, is in no sense prospected conclusively, even though many possible areas close to routes of travel have been pretty well gone over. The area within which the chances of profit by discovery justify the risk of loss from failure to discover commercially available mineral deposits is, however, restricted. Portions of the higher interior are so far back from water transportation that only enormously rich deposits will pay to work. Such deposits are not common, though not impossible. The Klondike district is both rich and favorably situated with reference to transportation. What is known as the White River country, and the northerly and westerly portion of the Alsek basin towards the St. Elias mountain range, is very unfavorably situated. Another condition that eliminates very considerable areas of the valleys is the glacial terrace accumulations.

Another deterrent condition is entirely artificial, but it is none the less certain to limit exploration unless removed. It is the Canadian mining regulations and royalty. No gold-mining industry in the world has been known to be profit earning enough to stand up under a royalty of 10 per cent of the gross gold output. Some individual mines may for a time, but the great number of mines cannot pay this and make a profit. The demonstration of this is conclusive when the gross gold output of the mines of any district is compared with the gross working cost charges against this output. Ten per cent of the gross output will certainly appear to be so large a proportion of the profit margin that if it were added as a cost charge it would make the business of mining undesirable. The practical effect of that royalty tax is to annihilate the unearned increment, or rather to appropriate it to the Government. The sale value of a mining claim is wiped out by destroying its profit basis. The placer claims are too small. The length, 250 feet in the Northwest Territory and 100 feet in British Columbia, is not sufficient except in the richest kind of ground. While it has not affected the development of the Klondike, where much of the ground is extraordinarily rich, it does affect injuriously the other districts. That one double discovery claim is allowed is very little incentive to explore remote localities. Lode location is regulated by the British Columbia laws and the claims permitted are of sufficient size. There is no royalty charge on the gold production. While capital will doubtless continue to invest in the Klondike placers, despite the royalty and smallness of claims, there will be little or no inquiry for and investment in the placer claims of Shorty creek and other localities where there may be placers of moderate richness.

In a general way, comparing the American portion of the Yukon basin with the country described, I consider the former as possessing very much larger areas within which there may reasonably be anticipated the discovery of profitable placer deposits. Even if none are found absolutely as rich as the Klondike, the proportion of the total output that is profit will be much larger from placers not nearly as rich. There is no royalty, arbitrary limitation of claim ownership, or vexatious mining regulations, and it is possible to acquire mining rights in fee by patent. In the Northwest Territory a mining claim is only a lease from year to year, and there is no vested right. The regulations are changed without notice and without appeal being possible. Instead of considering mining in this country as a legitimate

industry and business, the government of the country, through its officials, conducts it as a great "bunko plant." Independent of all its personal acts, of which individuals have complained, the Government has taken directly and indirectly \$3,000,000 out of a total gold production that has not yet reached \$12,000,000. This is a far larger sum than the aggregate mining profits realized out of this production by the claim owners. There is no game of chance where the deal has such a percentage in its favor. No other mining region in the world is similarly burdened. The Transvaal Boers, taking a far less percentage of the gold output of the Rand mines, seriously crippled the industry there, but their exactions are trivial compared with what is going on in the Northwest Territory. So long as the selling of stock and mines is a greater and more active industry than the mining of the gold, the "kick" at the percentage of the latter taken by the dealer (which is the Canadian government) is not forcible, as the principal game is not directly interfered with, and each player hopes to cash in winnings before he personally is downed by the percentage against the player.

There is a class of mining from which much has been expected in the Northwest Territory that is inevitably a complete failure. The Canadian government has sold several thousand "dredging leases," each the right to dredge a five-mile section of river bed in the Northwest Territory for gold. The sale of these leases has been a swindle from the start. There is not now and has not been a possible chance for "dredging" for gold in the river beds of the Yukon basin. River-bed dredging for gold can only be a commercial business when there is a gold-bearing river bed and physical conditions with it that admit of the employment of a dredger. In the Northwest Territory there is no gold-bearing river bed under the proper physical conditions. The conditions of placer gold genesis and distribution are such that the gold is in the minor gulches, ravines and valleys, and not in the larger valleys containing large water flows. If exceptionally in such a large valley (and I do not know of any such exception), the gold would not be under the flowing water of the river, but in the rock cut out of an older channel, obliterated by the stream wash forming the bed of the flowing stream. The gold-bearing channel would be crossed by the present flowing stream at one or more places, and might even be superimposed by it, and in such condition the dredging of these places under the flowing stream would produce gold, but elsewhere would be barren of commercial results. One "joker" in the Canadian dredging leases is that the right to dredge is strictly limited to the flowing stream bed between the banks of its "low-water flow." With that "joker" in the leases, even if the valleys were gold-bearing, the dredging for it could not be done where the gold is, but would have to be done where it is not. Even this last bare right meets another "joker" in the physical condition of the stream beds. These, except close to the contact with the flowing water, are perpetually frozen sands and gravels. It is an impossibility to excavate these frozen sands and gravels with a dredge, and even if excavated, they could not in their frozen condition be washed and the gold obtained. Briefly, it may be stated that there is no gold-bearing river bed to dredge; and if there was, it couldn't be dredged. It has not required the demonstration of trial to find out these facts. Not a single dredger trial in the Northwest Territory has yet been made; not a single lease has been prospected. But it was known to the Canadian official that the river beds in the Northwest Territory were perpetually frozen, and their expert advisers should have known (there is no excuse for not knowing) that in the Yukon basin valleys the beds of the flowing streams could not reasonably be sufficiently gold-bearing to make dredging a commercial possibility. The Canadian government has practically connived at one of the most widespread and gigantic mining swindles of recent years by officially recognizing the dredging of the Northwest Territory river beds in its official mining regulations, and has shared in the proceeds by selling the absolutely worthless leases for large sums of money. Purchasers of these leases have not received and cannot receive the slightest valuable equivalent for the money they have paid.

In this connection, to avoid the slightest misunderstanding of my meaning, I desire it distinctly understood that it is not dredging that is condemned as a method of mining, but the Canadian official appropriation of it to the Northwest Territory mining conditions. Given the gold-bearing gravels with the proper physical conditions, and dredging to exploit them for their gold is economically an ordinary business proposition, with only such mechanical risks as are incident to steam shovel and dredging work where gold mining is not the object of the operation. The problem of gold mining by dredging is no longer in a possible uncertainty of successful operation of the machine, but in finding the gold-bearing deposit under the proper physical conditions. Under the most favorable conditions dredging for gold costs no more per unit of material handled than hydraulicking does under its most favorable conditions of operation.

Methods of placer mining are still primitive in the

Klondike country. The rocker and the pan have first place; the sluice, operated by shovellers, is secondary. Fire is used to burn out the frost, not only to sink the prospect shafts, but to remove by drifting the pay gravel. High wages are paid and are necessary, working under the severe conditions. Many of the claims are owned by parties who have neither the capital nor the patience to wait on economical development of the ground. Aside from this last, there is no good reason why the Russian method of prospecting and determining areas of ground that can be mined at a profit, and Russian methods of mining improved by our tools and mechanical applications, should not be used. Hydraulicking is possible with some placers, but not many. Ground sluicing can be used to a limited extent. Drifting in the deeper old channels, where water is not at hand for hydraulicking, is sometimes available as a method, provided the gravel is thawed out. In frozen ground, unless quite deep, the open pit (Russian) method is preferable.

Quartz mining involves no new conditions or untried problems. Probably, though, mills cannot be operated in the cold season. Aside from this, costs should not be largely increased over the most favored localities. The transportation of machinery would be over the rivers in summer and by sled over the snow in winter. Installation will naturally involve more expense and time than in more favored localities, but, once installed, climatic conditions will not interfere, except as noted above, with continuous operation. In a word, there is no longer excuse for mystery in gold mining in the far north. It is simply such a commercial proposition as gold mining presents elsewhere.

Riveting of Boilers.

The following extract on riveting of boilers is taken from the American Boiler Manufacturers' Association's report: In riveting boilers the holes should be perfectly true and fair, made so by the use of clean cutting punches or drills; sharp edges and burrs should be removed by slight counter sinking and burr reaming before and after the sheets are jointed together. The under side of the original head of the rivet must be flat, square and smooth to insure perfect contact with the plate. For rivets from $\frac{3}{8}$ -inch to $\frac{1}{2}$ -inch diameter allow $1\frac{1}{2}$ diameters for length of stock to form the head; for large rivets less length. For a button set on snap rivets 5 per cent more stock may be allowed to form the driven head. Light regulation riveting hammers are to be used until the rivet is well upset in the hole; after that the snap and heavy mauls. For machine riveting more stock may be left for the driven head to make it equal to the original head, the exact amount to be fixed by experiment. The amount of pressure on the die should be about eighty tons for $1\frac{1}{2}$ inch or $1\frac{1}{4}$ -inch rivets; sixty-five tons for 1 inch, fifty-seven tons for $\frac{3}{4}$ inch; thirty-five tons for $\frac{3}{8}$ -inch rivets.

Rivets should be tested both hot and cold by driving down on an anvil with the head in a die, by nicking and bending, and by bending back on themselves, all without developing cracks or flaws. The heads of rivets ought to be of equal strength with the shanks; this is fulfilled by giving the head at the periphery of the shank a height equal to one-third the diameter of the shank. A slight fillet at this point is advisable. The rivets should have a diameter about double the thickness of the thinner plate; the pitch should be about three times the rivet hole; the distance between staggered rows of rivets half the pitch; the lap for single riveting about equal to the pitch; the lap for double riveting about one and one-third times the pitch and one-half pitch more for additional row of rivets.

A factor of safety of four and one-half shall be used where the tensile strength of the plate and the shearing strength of the rivets have been determined by actual tests; where this has not been done a factor of safety of five shall be taken, and at most 55,000 pounds tensile strength per square inch for steel plate and 40,000 pounds sheer strength per square inch for rivets be allowed. Rivet holes may be either punched with good sharp punches and well-fitting dies in American Boiler Manufacturers' Association steel up to five-eighths of an inch in thickness; above that thickness either punching and reaming with a fluted reamer or drilling is advisable. The judicious use of the drift tin with light hammers in pulling the plates into place and rounding up the hole is not objectionable; but enlarging or gouging holes to fit by driving in a pin with heavy hammers or mauls is condemned as a bad practice. When drawn into an approximate fit, the holes must be trued up by means of reamers.

A Montana Opinion.

The MINING AND SCIENTIFIC PRESS of San Francisco is the great mining publication of the West—newsy, sufficiently scientific to interest experts and not too technical to be of interest to prospectors.—Boulder, Montana, Age, Oct. 19th.

The Present Conditions of Gold Mining in the Kochkara Region in the Oural.

Written for the MINING AND SCIENTIFIC PRESS by R. HELMHACKER, Prague, Bohemia.

This gold field, extending on the eastern side of the Oural range, lies in the Government Orenbourg in the land of the Kozaks of the Kosoibrodstanica, and is termed by the Oural Mining Department as the seventh Orenbourg mining region in the Oural. This field, about 55 km. northwest from Troick, or 85 km. southwest from Mias, can be reached from the railway station Bishkeel, between Zlatoust and Cheliabinsk, in passing the Bashkir villages Medviejeva, Kazbaieva, Karatanova, Koelgha and Kochkar, lying on the Kabauka rivulet, distant on the country road 92 km. from the railway. From Kochkar 27 km., nearly in a southern direction, is the Kosoibrodstanica, on the Sanarka rivulet. From Kochkar in strictly southern direction to the Sanarka rivulet, in the length of about 35 km., extends this gold field, from which the northwest corner southward from Kochkar, covering a space of 50 km. square, has most of the mining establishments.

In this were discovered gold detritus, or rather alluvial gold, in 1844, along the highest course of the small tributaries of the Kabauka and Sanarka, both flowing to the Ooi, farther to the Toora and then in the Irteesh, thus along the Kabauka with the Kochkara, the Chornaia, the Antipin gulch; then along the Sanarka with the Kamenka, the Tioplaia and the Oseika. In 1849 were seven claims working; in the years 1863 to 1867 the primitive gold deposits were discovered. The number of claims increased rapidly to 70 in the year 1870 and reached 330 now in 1898, with about 360 to 400 developed gold-bearing veins. The average yearly output for the last five years afforded from the placers in the Kochkar region amounted to 340 kg. and from the veins 1330 kg., while the annual gold extraction from all the mining establishments in the Kozak lands in this section of country averages annually 2750 kg. The total amount of gold washed from the placers from 1844 to 1897 equals 25,160 kg., while from the veins were extracted, from 1868 to 1897, 21,900 kg., or jointly 47,060 kg., to which must be added yet 450 kg. of silver.

Led by the mining importance of this region, the director of the Geographical Comité in St. Petersburg, A. P. Karpinsky, suggested that it be geologically surveyed, and mining engineer N. Vysocky is now engaged in this work.

The geological features are simple in the mining district. A broad zone of granite forms the prevailing rock, in which are subordinately found long streaks of crystalline schists, large masses of serpentine and also strata of carboniferous limestone of the lower division. In the district where the mines are situated the granite is decayed and more rotten than in the other portions of its extent, evidently by the influence of chemical and dynamical agencies. The 35 to more than 40 km. broad granitic or somewhat granito-gneiss zone, directed with its length in the direction from north to south, was subject to a great many east-west—also transversal—fractures or disturbances, forming now very numerous, nearly parallel, faults, which, having enclosed masses of detached and fragmentary granite, like in grousans, now form series of rock-lode courses. These lodes, with stony gangue or rock to several meters thick, were formed of dynamical and chemically decomposed and metamorphosed granitic country rock; therefore dynamo-metamorphic grousans exhibit dark grey-green hues, are sometimes somewhat slaty and bedded and composed of crushed orthoclase, plagioclase, quartz and biotite as primary elements, with secondary formed species as biotite, chlorite, talc, phyllosilite, calcite, pyrite, and others. In some lode matter amphibole is also present. The granitic country rock traversed by these rock lodes is entirely decayed to a friable mass, in which the orthoclase, or generally the feldspar, is decomposed entirely or partly to quartz, pyrophyllite and kaolin, particularly below the earth's surface to a depth varying from 20 to 60 m. Such entirely rotten granite exhibits either the characteristics of a white or pink argillaceous mass, unctuous to the touch, or they are brownish in the gangue lodes.

The dark gray-green rock courses of dynamo-metamorphic granite stuff form the country rock for true quartz veins, trending either amidst them as fissure veins, or lenticular veins, or a network of veins, or on the contact between the gangue lode and the decomposed granite country; or the quartz vein runs sometimes, but rarely, through the granite country itself. Therefore, the quartz veins in the dark gray-green rock dykes extend conformably with them, also generally from west to east and mostly parallel to the bedding, sometimes slightly directed to the southwest or southeast, inclining more or less perpendicularly, or nearly so, sometimes lesser to the angle of 60° either to north or south, appearing in about fifty parallel vein systems. As the lode matter were later dislocated in the direction of the bedding or slaty structure, rarely also disturbed in a transverse direction, the gold-bearing

quartz veins traversing them, in coinciding mostly with the bedding, exhibit the same displacements.

The quartz veins in the rock lode, or the quartz blotches and lenticular strings or minor veins, all forming an object of mining, exhibit thicknesses varying from thin plates, a few centimeters thick, to 2 m., sometimes even 3 to 4 m. and more, when forked into a network of veins. The quartz in the veins differs in its character; it is either not transparent and high-grade gold-yielding, or transparent in the veins beneath the Oseika brook; the white quartz veins are of higher grade than the gray ones. Generally the vein quartz is grayish or greenish with included strings or nests of chalcedony, on some spots also calcite or chlorite filling sometimes, though sparsely, also the whole vein fissure. The quartz vein, with the accompanying chalcedony, contains in the vein matter inclusions of arsenopyrite, pyrite or pyrite mixed with chalcopryite, antimonite and also galenite, very seldom tetrahedrite.

Near the outcrop the quartz veins are cellular, sometimes spongy, containing disintegrated bleaked chalcedony, with products of decomposition of other minerals, as spotted with iron ochre, manganese ores, green and blue copper minerals (malachite and azurite), on places, also with pharmacosiderite and arsenosiderite, and even with small nests of embolite. Such tinged minerals are found also in the country rock, or the argillaceous mass formed out of decomposed granite.

The granite, decayed to an argillaceous matter, is mined on some places beneath the soil, mostly in the vicinity of the lode rock, as the strings and branches of chalcedony and quartz penetrating it are gold-bearing.

Generally the quartz veins are all resembling, but in some cases the principal vein lays in the contact between the lode stuff and the disintegrated granite, with a strike to even 3-4 km., or some thick quartz vein, in thickness to 3 m., divides into a network of strings; but the course of veins is mostly indicated by long lenticular quartz slabs, extending from 1 to 10 and more metres, and swelling up periodically from $\frac{1}{2}$ to $\frac{1}{3}$ m.; or they are thinning and then dying out in depth as well as in the strike to a mere joint; but in some distance new veins of the same character are again appearing. In some instances gold-bearing veins or lenticular veins are dislocated by their parallel barren quartz counters. Though the lenticular quartz veins thin out entirely, new ones appear again—though not in the same bedding slide—in another contiguous plane in the dynamo-metamorphosed lode rock.

The vein stone to the depth beginning with 20 m. to 50 m., and yet deeper—that means to the depth of the constant water level—is cellular or spongy quartz, with ochre impregnations or ochery spots in it, with free gold, either in visible granules or wire-like aggregates or thin sprinkles, or with invisible free-milling gold. The lode gangue, also the entirely decayed granite near the vein walls, contains also free-milling gold. The gold yield in the disintegrated quartz in the veins varies from 4 to 30 gr. in one ton; in aggregate the vein stuff contains 5 to 13 grams per ton.

Deeper down to the level of constant water the veins in their decomposed condition decrease a little in their yield of gold, which is attributed to the increased appearance of undecomposed chalcedony more than in the quartz and its ochers. The quartz and chalcedony in the veins afforded from 4 to 10½ gr. Au. in the ton, also a decrease in the yield as compared with the more disintegrated vein mass beneath the outcrop. Thus some stuff which gave 4 to 10½ gr. Au. in one ton left, when worked, about three-fourths of its bulk of chalcedony with a yield of 44 grains Au. in one ton. Some other chalcedony inclusions tested with a tenor from 40 to 400 gr. Au. in one ton, gave crushed, washed and amalgamated returns from 5 to 10 gr. Au. in one ton. Though the decrease of the Au. tenor with the appearance of more undecomposed chalcedony is evidently proved, the gold content is more constant and less fluctuating than in the uppermost more disintegrated portions of the quartz veins without the frequent inclusions of fresh chalcedony.

Yet deeper, also below the constant water level, the veins with the chalcedony inclusions carry granular portions of sulphureted ores either pyrite or arsenopyrite, while the free gold afforded by the washing and amalgamating operation from the quartz and chalcedony decreases to 8-4 and less grams in one ton. Sometimes the chalcedony forms only 4%, with 20 to 25 gr. Au. in one ton, of the vein stuff. In such depth, where the sulphureted ore begins to appear, the free gold is yet sometimes, though rarely, visible in thin splashes covering joints or slides in the vein stuff.

(To be Continued.)

TELEGRAPH and telephone poles are now being manufactured out of paper. The pulp from which these poles are made has mixed with it borax, tallow and other ingredients. It is then run into a mold with a central core and comes out as a hollow tube of the proper diameter and length. Before being erected the poles are given a coat of paint or varnish which makes them waterproof. They may be made fireproof by saturating with a solution of alum water.

Carbons for Diamond Drills.

Written by AMERICAN CONSUL FURNISS.

The State of Bahia is said to be the sole seat of the carbon industry. The carbons have been found for years; but there has been no market until the commencement of the present decade, when, on account of their hardness, they were sought by makers of diamond drills. As the demand grew greater the supply decreased and prices rose. The region in which they are found is in the interior of the State and is reached only after a long and tiresome journey. One goes from Bahia by boat to St. Felix, and then by rail to Bandeira de Mello. This is the edge of the diamond region, and carbons are always found near diamonds. The most productive region is further up the Paragassu river, and to reach it one goes overland by mule, following a rough and hilly pack trail for a couple of days. It is thought that diamonds and carbons are found all through this section; but, on account of the rude methods of mining, only the bed of the Paragassu and its tributary, the San Antonio, and the side of a range of mountains called Serra das Lavras Diamantinas are worked. The carbons are found in a kind of gravel called cascalho, and this occurs in the river bed beneath the silt and on top of a stratum of clay; in the mountains, beneath a stratum of rock and above the same stratum of clay; and in the surrounding country, beneath several strata of earth.

To obtain those in the river bed a place of not more than 20 feet in depth and where the current is not too rapid is selected. A long pole is then planted there and naked divers go down this pole, taking along with them a sack kept open with a ring. They first scrape away the silt and then proceed to fill the sack with the underlying gravel, removing all the gravel down to the clay. As soon as a sack is full the man above, in one of the native canoes made from a chiseled-out tree, is signaled to. The bag is raised to the surface with the aid of the diver below, taken to the shore, and dumped at a sufficient distance to prevent being washed away by any sudden rise in the river. This operation is repeated day by day for the six months of the dry season. At the commencement of the rainy season, when diving has to be suspended on account of the strong current and great depth of the river, the gravel is washed and examined for carbons and diamonds. The divers are quite skillful, and many of them can remain below for a minute at a time; there are some who stay as long as a minute and a half. Of course, the gravel becomes partly recovered by silt while they are at the surface, thus causing extra work, which would be avoided by more modern methods. Places where there is greater depth of river can not be worked at all.

The other method of mining consists in drilling through the rock in the mountain side, and by a series of tunnels removing the diamond and carbon-bearing gravel. It is piled up in the dry season and washed during the rainy season by conveying the water down the mountain side in sluices. The greater part of the carbons is found in the mountains, because they are more accessible here than in the river bottom. No mining of any consequence is attempted elsewhere than above stated, except along the river bank; and little is done there, because the water runs in as soon as the carbon-bearing gravel is reached, and with their rude methods the natives can not bail it out fast enough. The reason why no mining is attempted in other places is on account of the lack of water to wash the gravel after it has been raised. The idea has never occurred to them to use modern mining machinery, or, if it did, they have not the capital to invest.

Carbons are found in all sizes, varying from that of a grain of sand to one of 975 carats. This large one was picked up in 1894, on a road where the gravel formation was exposed, and was sold in Paris for 100,000 francs (\$19,300). The most valuable ones are those weighing from one to three carats. The larger ones have to be broken and there is always great loss, as they have no line of fracture. Thus the largest carbon found, after being broken into salable pieces, brought considerably less than 100,000 francs, the cost price.

About two years ago there was a local combination to keep up prices, but the chief promoter failed and there has since been no attempt to combine. The price that now prevails is due entirely to the great demand, small supply, and the laborious method of mining. The small supply is due to the crude methods. Frequently a pair of workers will obtain only three or four carbons as a result of their six months' work, and for these they demand and receive a good price. The large export dealers have their business here and agents in the mining region; but as the miners keep posted as to the market price, the dealers are little more than commission houses. The largest exporter in Bahia is Theophilo Gomes de Mattos, Rua Cons. Dantes. He has at present about 125 carats of carbons of well-assorted sizes, and will ship to the United States on the same terms as to Europe. He has never sold to the United States because the purchasers there insist on par-

tical sizes, and he can not sell picked stones, but an assortment, as he buys them, and for which there is always a demand. The price to-day is about \$5 per grain, making a carat worth \$22.50; but the price fluctuates so much that no definite information can be given. Another dealer in Bahia is Francisco de Mello & Co., Rua Cons. Dantes. They should be addressed in Portuguese or French, though the first named reads German.

Bahia, Brazil, Aug. 24th, '98.

The Use of Aluminum Alloys.

Aluminum bronze is an alloy of copper and aluminum, in proportions varying from 89 per cent copper and 11 per cent of aluminum to larger proportions of copper and so small a percentage as 4 of aluminum. This series is known as aluminum bronze and forms one of the strongest metals known to the arts. Owing to the large percentage of copper which this contains, however, it is not feasible to use this as a substitute for, or in competition with, brass and this metal is used principally where great strength is required, or where great strength and a non-corrosive metal are desired. Aluminum bronze probably is affected less by acid than any of the so-called "acid metals." This is also true of the action of salt water upon it. Aluminum bronze is also used for bearings where a good anti-friction metal is required.

In aluminum brass the percentage of aluminum which is used varies from $\frac{1}{10}$ of 1 per cent to a 10 per cent mixture. The lower percentage of aluminum in brass is used more particularly to give the brass additional fluidity, and, consequently, enable castings to be manufactured which will appear sharp and clean. Results can be obtained thus by the use of a very small percentage of aluminum, which it is impossible to obtain with the ordinary brass mixtures without its use. It is possible to use a cheaper grade of zinc when some aluminum is added and considerable strength is required, provided the zinc does not contain too much lead as an impurity. The presence of much lead in zinc, when the most inferior grades of zinc are used with aluminum, causes the lead to sweat out on the surface of the castings and discolor them.

The way in which aluminum is added to brass is to first make a mixture of aluminized zinc of some standard percentage. This aluminized zinc generally contains 10 per cent of aluminum, and is made by taking a plumbago crucible and melting in it one pound of aluminum. After the aluminum is melted, zinc should be added as fast as the molten metal will take it up, until all of the nine pounds have been added.

Then the crucible is removed from the fire, and the contents cast into molds of convenient form and size, which can afterwards be broken up; and this aluminized zinc is introduced into the copper with the other zinc, and in such proportions as will give the required amount of aluminum in the finished casting.

When aluminum is used, as previously stated, in small percentages, from $\frac{1}{10}$ to $\frac{2}{10}$ per cent—that is, from two to four pounds of aluminum to a ton of brass—its action is towards clearing the metal of impurities and giving additional fluidity, rather than giving additional strength, and it is not until one-half of 1 per cent is added that an increase of strength is secured in the finished casting. It has been found by careful experiment that the introduction of aluminized zinc in brass causes a much smaller loss in the zinc than if aluminum is not used; that is, it seems to prevent to a certain extent the zinc burning or volatilizing, should the metal become overheated—which is always the case to a certain extent, for it is never possible to weigh out of the crucible as much metal as has been placed in it originally.

Brass is now made and used in connection with acids, known as "acid brass," and contains copper, iron, lead and antimony. This, properly speaking, is more nearly a bronze than a brass; and it is possible to manufacture with copper, tin and a small amount of aluminum a brass which seems to be superior in withstanding the corrosion of most acids. The percentage of copper which is used is a little more than is ordinarily used, and the percentage of tin less.

Some large brass mills manufacturing sheet now use a small amount of aluminum in their sheet brass, and it seems to enable them to cast their ingots more perfectly and to roll not only a stronger sheet, but one with a more perfect surface than can be obtained without the use of aluminum. This whole subject, however, of the use of aluminum in casting brass is to a certain extent new to the majority of brass founders, and is little talked of by those who use it, for the reason that where they have secured advantageous results they have kept it to themselves to reap the benefits which accrue when there is close competition.

Copper melts at about 2000° Fahr., and if a small amount of aluminum, which melts at about 1200° Fahr., is introduced into a large volume of copper, it comes to the surface and is oxidized, and the full advantage effected by the aluminum is not felt. If any of the aluminum does oxidize, some remains in the brass or bronze, as the case may be, in the form of an oxide of aluminum, a white powder, which

will show out on the surface of the metal if it is turned to a finished surface, or if the metal is rolled into a sheet and then polished.

If, however, the aluminum is properly introduced, there is no reason it should be oxidized, and a perfect surface can be obtained, the finish on such a metal being of a high quality. It is to be noted, however, that it is not desirable to use aluminum in brass which is to be dipped, for the reason that the introduction of aluminum gives the brass an acid-resisting quality, and no matter how small a percentage of aluminum is used in brass, if it is intended for dipping purposes the effect of it will be quite apparent, and it is impossible to obtain such a finish as if no aluminum were used. But this very quality makes the presence and use of aluminum in brass particularly advantageous and desirable for any place where the brass must be used to withstand corrosive action, either from acids, water or salt air.

In making brass castings, owing to the additional fluidity mentioned above, it is possible to increase the number of patterns on the gate, where a lot of small castings are being made from one-third to one-half over what can be cast if no aluminum is present. This is one of the principal advantages and uses for aluminum in brass castings, where the aluminum is only used in very small quantities. The presence of aluminum in either brass or bronze tends also to change its color slightly. The larger the percentage of aluminum that is used, the lighter the finished article will appear.

In the case of aluminum bronze, 95½ per cent copper and 4½ per cent of aluminum will give a color which is almost impossible to detect from 14-carat gold. It is to be noted, however, that the addition of very much aluminum will materially increase shrinkage, and this should be provided for in casting work by using larger gates and higher risers.

In very small articles, the addition of aluminum has been found to be particularly desirable; for, owing to competition, the manufacturers of this class of goods have been obliged to use a poor grade and cheap quality of brass, and by the addition of a small amount of aluminum they are not only able to get a casting which is stronger and superior in quality, as far as actual strength is concerned, but they are enabled to cast more pieces from a single gate or flask, and consequently considerable time is saved in making up the moulds for such articles, the saving thus accomplished forming an item in the competition which is to be met, owing to the reduced foundry cost of the article manufactured by the use of aluminum.

It is to be noted in both the alloys of copper, zinc and aluminum, and also copper and aluminum, that the use of too much aluminum will give a very brittle metal. On the copper end of the series the dividing line between the strong and the brittle alloys seems to be exactly at the point where a very decided change in color takes place; that is, where the metal changes from the yellow color of gold to the white color of silver, and this change takes place in a mixture containing between 80 and 85 per cent of copper. Alloys which contain more aluminum than this, as, for instance, 25 or 30 per cent, become so brittle that they will break if they are dropped on a stone or iron floor, and the machining also becomes very difficult, as the metal chips and does not turn smoothly. In some special cases these higher alloys can be used—if no strength under a blow is required. They have a very hard surface and take an excellent finish.

It is also to be noted that with the use of very much aluminum—that is, for percentages from 1 to 2 per cent in either brass or aluminum bronze, the strength increases to a very noticeable extent on the second and third melting. This is accounted for by the fact that a more perfect alloy is formed between the metals and the aluminum on each successive melting. Taking, for example, ordinary castings of 90 per cent copper, 5 per cent tin and 5 per cent aluminum, on the first melting these are of about 41,000 pounds per square inch, ultimate tensile strength. These castings on the second melting are of nearly 43,000 pounds tensile strength.

Mixtures of 10 per cent copper and 10 per cent tin usually give only from 33,000 to 34,000 pounds as their ultimate tensile strength; and when these proportions are increased to 20 per cent of each metal the tensile strength is only about 2000 pounds, and the metal is found to be extremely brittle. The maximum shearing strength of the copper-aluminum-tin alloys is also about the point of the maximum tensile strength, that is, where there is from 5½ to 6 per cent of each metal present. The maximum tensile strength of aluminum bronze is at about the point when it contains from 1 to 10 per cent of aluminum.

It is to be noticed that the addition of about 6½ per cent each of aluminum and tin to copper increases the tensile strength nearly three times and makes it a very much harder and a denser metal, and consequently of more value in the arts.

NIKOLA TESLA announces the discovery of a method by which electrical energy in large quantities can be transmitted through the atmosphere without the use of wires or other metallic conductors.

Where Silver is Produced at a Cost of 23 Cents Per Ounce.

In the "Concentrates" column of the issue of October 1st, referring to the degree of perfection attained in the economical production of gold, it was stated that "in Mercur, Utah, gold is produced from the mine cheaper than silver can be there so produced." Under date of October 11th Mr. Wm. Orr of Salt Lake City, Utah, wrote correcting the statement, and saying that "from the majority of the mines in the Mercur district gold is produced at a cost of, approximately, \$8 per ounce, while at the Chloride Point mine, under the management of Mr. Gill S. Peyton, and by the use of the MacArthur-Forrest cyanide process, silver is being produced at a cost of 23 cents per ounce." The statement, published in the issue of October 22nd, attracted considerable attention, and, in response to a request for further information regarding so important an assertion, Mr. Orr, under date of the 31st ult., sends the following:

"Chloride Point ore is composed of altered cherty and shattered limestone, with which are associated the minerals calcite, barite and gypsum in quantity, and traces of galena, cerussite, stibnite, malachite, azurite and red oxide of copper. The silver is carried in very fine layers of chloride of silver in the cracks of the altered and silicified limestone. The milling ore carries no lead, but a considerable percentage of lead is found in the shipping ore. The copper minerals, although only present to a very limited extent, are always associated with the silver, and prove an excellent indicator of the rich ore. The method of milling is as follows: The ore is crushed to ¼-inch mesh and placed in the tanks (20 feet diameter and 8 feet deep), and there leached from seven to ten days with varying strengths of cyanide solution, the solution meanwhile being run through zinc shavings to recover the values. The first solutions drawn off the ore carry from 18 to 32 ounces silver per ton of solution, according to the value of the ore and the strength of cyanide solution employed, the silver contents of the solution gradually decreasing as the values are extracted and drawn off. By assay of the solution the necessary time for leaching is determined. The product from the zinc boxes is exceedingly pure, running from 800 to 945 fine, without any refining whatever. The loss of cyanide is approximately 2½ to 3 pounds per ton of ore. The extremely silicious character of the ore enables leaching at considerable depth (8 feet), and the occurrence of the silver as chloride in the fractures of the altered limestone gives the cyanide solution an excellent opportunity of acting upon it, and this is the principal reason which admits of the high silver extraction from this ore at such a low cost by the cyanide process."

California State Miners' Association.

From Secretary Sonntag it is learned that the annual convention of the California Miners' Association will be held at Native Sons Hall, on Mason street, between Post and Geary streets, in San Francisco, commencing Monday, November 21st, at 10 A. M. It is hoped that a large delegation from the different counties in the State will be present, as many matters now under way will have to be acted upon by the convention.

Accompanying the notification Mr. Sonntag writes expressing the hope that the miners of California will note the fact that, in view of the valuable work done by the association in past years and matters now pending in Congress, it is of importance that there be a large and influential attendance at the convention. He adds that, while at the present moment a political struggle is going on in this State, it is sincerely hoped that the miners will not forget this annual convention, for there is important legislation pending in Congress, and matters of importance will come before the Legislature which convenes in 1899.

"If we work in conjunction with other mining States, there is no question but that we will secure a Secretary of Mines and Mining in the Cabinet."

"It is now time that the county organizations be called together for the election of delegates and plans made for an important session."

Record of Good Work.

On the first and second pages of this issue appears a record of some good tunnel work this past summer in Calaveras Co., Cal., with practical details and comments by the manager, who, with characteristic modesty has little to say on his part in securing such results. Noticeable in the record is the progress made—over 10 feet per day—and the economy of operation. It is of interest, also, to note the comparisons instituted by Mr. Ralston as to the record and cost of such California work in '88 and '98.

THE former owners of the largest tinplate establishment in the world have disposed of the works at Swansea, Wales, and are about to establish a manufactory in the vicinity of Pittsburgh.

A New Assay for Mercury.*

By R. E. CHISM.

The dry methods of assaying mercury ores and other combinations of mercury all rest upon the volatility of this metal as a beginning. After the separation of the mercury in the form of vapor from the matrix upon which the assay is performed, the mercurial vapors are either condensed upon cold surfaces, or received upon a gold plate into which the mercury is absorbed. In the first case the product is recovered and weighed as metallic mercury in an isolated state. The distillation processes are practiced in either earthen or iron retorts, sometimes made of gaspipes or in other provisional ways, or in glass tubes and upon quantities varying from a kilogramme or two down to a few grammes. In any case the results of a distillation assay are sure to be uncertain and unreliable, through loss of mercury, for close work. There is a great deal of difficulty in sealing all the joints of the apparatus, so as to prevent the escape of mercurial vapor. The metallic mercury after condensation is, at least in part, divided into minute globules, which are very elusive and frequently include particles of dust or other foreign bodies. As a result the distillation processes ought to be, and probably are, relegated to the class of "rough tests," in which capacity they are very useful. The sight of the metallic drops has often loosened the purse-strings of the doubting investor. The production of mercury on a large commercial scale is well known to depend upon the utilization of ores of very low grade; and where this is practiced it long ago became necessary to discard the distillation methods of assay in favor of others that would give more exact results and admit of closer comparisons.

The substance which I use to receive the vaporized mercury is pure silver foil, 0.02 millimeter in thickness. At each assay I use a piece about five centimeters square, weighing about 0.6 gramme; it can be used three times, so that the cost becomes less than 1 cent per assay. For cooling the silver foil I use a silver dish of wide pattern, it holding a little more than 20 cubic centimeters of water and weighing, empty, 29 grammes. It is kept highly polished, especially on the bottom, to betray any particle of mercury that might soak through, during the determination, from the foil which is under it. However, this has not happened in a large number of assays, and is not likely to happen if proper care be taken in making the charge of ore. If it did happen, there would be no great harm done, as the mercury could easily be driven out of the dish by heat. This would involve, of course, the loss of that particular determination, which would have to be repeated with a smaller charge of ore.

As a retort, if I may call it so, I use a Battersea annealing cup, size C. This is a crucible of unglazed white clay, in the form of a truncated cone, 2 centimeters outside diameter at the bottom, and 3.5 centimeters diameter at the mouth; the height is 4.5 centimeters. The mouth may be ground to an even surface in any convenient way, but generally this is not necessary.

Heat is applied to the bottom of the retort during the operation. To prevent the direct heating of the upper part of the crucible and of the silver foil and cooling cup, I make use of a circular tin shield, 13 centimeters in diameter, which has a hole in the center a little less than 3.5 centimeters in diameter. The annealing cup will pass almost through this hole and will remain firmly fixed therein, with about 1 centimeter of its upper part protruding. The tin shield serves also to suspend the crucible and the rest of the apparatus from the ring of a retort stand. The annealing cup used as a retort is of indefinite duration. The tin shield costs practically nothing. For heating the apparatus I use a small gas lamp, which holds about 60 cubic centimeters of alcohol filled.

For a flux I use iron filings, the finer the better. Those I have in hand would go through a 60-mesh sieve. A long time ago I secured several hundred grammes of these filings, and prepared them for use as a flux by first lixiviating them with strong alcohol to remove most of the grease, and then igniting the filings by heating them to redness for some time in a muffle. The filings are preserved for use in a glass bottle with a rubber stopper. The cost of this flux is practically nothing. The charge for a mercury determination is from one-half to one gramme of ore. This is intimately mixed with five grammes of the prepared iron filings. The mixture is accomplished in the annealing cup itself by means of a spatula. About one gramme of iron filings is placed on the charge as a cover.

After the crucible or retort has been charged, as above described, it is hung by its tin shield from the ring of a retort stand. A piece of silver foil is then cut large enough to cover the mouth of the crucible and leave a good margin of, say, one-half centimeter all round. The foil is carefully smoothed, and then ignited in the flame of the alcohol lamp. Care must

be exercised, for the foil is so thin that it will fuse at once if allowed to overheat. After cooling sufficiently, under cover, the foil is weighed on an analytical balance and is placed upon the mouth of the crucible. It is then gently pressed down with the finger until it moulds itself to the shape of the mouth of the crucible. The cooling cup is then placed upon the crucible on top of the silver foil and is filled with water. The alcohol lamp is placed under the crucible and is arranged to give a flame about four centimeters high, which shall just barely spread out at its point over the central part of the bottom of the crucible. The heating should continue in this way from ten to fifteen minutes. Ten minutes is too short for most ores, and anything over fifteen minutes is apt to lead to loss of mercury. Over twenty minutes is, in most cases, fatal. The water in the cooling cup may be renewed once or twice during the

weigh to 0.1 milligramme. With the above apparatus a content of 0.01 per cent of mercury is clearly appreciable. The stain produced by that amount of mercury is plainly visible on the foil. Owing to the extreme flexibility of the foil, a number or a date can be easily marked with a blunt point of any kind upon the corner of any one of the pieces of foil, and this can be preserved for future identification. Some of these foils have been preserved in my laboratory for several years, and still show the mercurial stain without apparent alteration, and with no perceptible loss of weight. On carefully igniting the foil over an alcohol flame, the mercurial stain disappears, and the foil can be used for other determinations, probably for an indefinite number of times, if desired. This test for mercury, viewed as simply qualitative, is more positive and more easily applied than most of the qualitative tests given in the books

with which I am familiar. Any prospector provided with a few ounces of iron filings, previously ignited on a piece of iron over a stove, a small crucible or annealing cup, an ounce of silver foil, a copper cooling dish and a spirit lamp, can test his ores for mercury in a very easy way. When the spirit lamp is not at hand the necessary heat can be had from a lump of ignited charcoal.

The Golden Gate Park.

Golden Gate Park is the pride of San Francisco and the delight of all classes of its population—but it is far more than a municipal belonging. It is the Mecca toward which pilgrimages are made from all regions around the Bay of San Francisco. But the park extends its influence far beyond the bay region and visitors to the metropolis from all parts of California eagerly apportion a good fraction of their leisure time to the enjoyment of the city's pleasure ground. Thus the Golden Gate Park becomes, as it properly should, a California institution in which all its people feel a proprietary interest. Nor do State lines enclose its fame nor limit its influence. All tourists have heard of it in advance and are loth to leave its charming precincts. In fact, that park is known throughout the world and reflects credit upon California among all civilized people. The development of Golden Gate Park from an area of wind-swept, shifting sands is in fact one of the triumphs of modern landscape architecture and is so regarded by landscapists, nature lovers, artists and humanitarians everywhere.

The view upon this page represents a unique feature of park improvement—a

HUNTINGTON FALLS IN GOLDEN GATE PARK.

heating; possibly it would be well to use ice water for this purpose. Water at ordinary temperatures, however, has always given me good results. When the heating is finished, the crucible and contents are allowed to cool at least five minutes. When the silver foil is removed, a distinct mercurial stain will be seen upon its lower surface, if there was the slightest trace of mercury in the ore. The amount and depth of this stain is a rough indication of the amount of mercury in the ore. The foil is conveyed, under cover to avoid dust, to the balance. The increase in weight of the foil shows the amount of mercury absorbed; and a simple calculation gives the amount of mercury contained in the original charge of ore. In order to check the first determination, and to make sure that all the mercury has been collected, I repeat the heating on the same charge for about ten minutes more, and then weigh again. If the weight is constant, or there is a slight decrease, the amount of mercury obtained by the first weighing may be considered correct. If more mercury has been absorbed on the second weighing, I repeat the determination with a new charge and heat for a longer time, say, from five to ten minutes longer, than at the first heating.

I use a Kohlbusch analytical balance, which weighs down to 0.05 milligramme; but I generally only

waterfall which is wholly a work of art, believed to be the only artificial waterfall in a public park on the continent. The basis for it was a sandhill practically devoid of rock or tree or shrub, everything shown in the engraving which ministers to beauty and realistic effect had to be hauled and constructed or planted to produce the waterfall. Even the water has to be furnished by pumping, for there is no flowing water in the park.

The war just ended was the first in which modern steam vessels have had a thorough trial, says Chief Engineer Melville in his annual report. He also says there was a remarkable absence of casualty in the machinery department of the fighting squadron during the war, but the torpedo boats could not show the excellent record. The report says: "It is a sad state of affairs that nearly every one has had some accident; and the machinery of some, at the close of the war, was in a condition that can be described as horrible. The boilers were burnt, the cylinder covers broken, the pistons and valves stuck and everything was in bad shape. This condition of affairs seemed attributable to two causes—the absence of trained engineering supervision and the handling of boats for duty, for which they were not intended."

The Refining of Base Lead Bullion Contain-
ing Silver, and High in Gold.*

NUMBER I.
By G. H. BLAKEMORE.

The operation of refining base bullion may be di-
vided into the following heads :

1. Softening.
2. Extracting the gold and silver from softened bullion.
3. Refining the desilverized lead from (2).
4. Liquefaction of gold and silver crusts obtained in operation (2).
5. Retorting the residue from (4).
6. Concentrating and refining bullion from (5).
7. Parting Dore bullion from (6).

Softening Process.—The end in view in this process is to remove all deleterious metals from the bullion. These undesirable impurities may be copper, arsenic, antimony, tin, tellurium, bismuth, sulphur, iron, etc. The elimination of these at the beginning of the process both cheapens and hastens the desilverizing and deaurumizing process, and they must also be ex-
tracted before the finished product of lead is fit for the market as "soft lead," to be afterwards used in the manufacture of pipe, sheet, tea lead, etc.

In a customs smelting works every possible impuri-
ty may be present in the base bullion produced from the blast furnaces, for the simple reason that smelt-
ing works of this class get all ores which mine own-
ers find unprofitable to work themselves on account of their base and refractory nature, with occasionally a little "good" ore. The latter supply is, however, a very precarious one, for if any considerable body of it is developed in the mine it comes from, the share-
holders always hanker after works of their own; whether it will pay or not is seldom a matter that is considered by them, and the unfortunate manager is worried into erecting them. So, therefore, although the customs smelter is a little uncertain about his "good" ore supplies, he never has to worry himself about his base ore supplies. He will get them!

The operation of softening the bullion is, then, one which takes considerable time when base or dirty bullion has to be worked.

The work is done in reverberatory furnaces. In small works one furnace of a size suitable to the out-
put is used for the whole operation of softening, but in large works, where not less than 500 tons of base bullion are treated weekly, two furnaces are used, each from forty to fifty tons capacity, according to circumstances. The first furnace is then used to ex-
tract the copper (arsenic and tin, if any). When the lead is free from these metals it is run off into the second furnace, where the antimony is taken out. Considerable time, and therefore expense, is so saved, but, as before hinted at, it would not pay to do this in works producing only fifty to seventy-five tons of base bullion weekly. If it were done there could be no continuity of work, as the softening fur-
naces would handle the lead faster than it was pro-
duced, and as a result the stoppage of refinery for a time and the loss of skilled hands, the latter not be-
ing a pleasant matter for the metallurgist in charge! At the end of every "run" the bullion would have to be allowed to accumulate again, and accumulation of valuable bullion absorbs too much capital; it is more than doubtful if the interest on the capital so locked up would not amount to more than the saving ef-
fected by using large softening furnaces. Hence, in works having a small output of lead weekly, the plant must be designed to fit, and this article is meant to deal with the conditions ruling in works with a small output of base bullion.

With an output of up to eighty tons weekly, softening furnaces of about fifteen tons capacity are large enough. The sides and ends of these furnaces are usually surrounded by a 2-inch water space, which extends some 2 or 3 inches above the level the charge stands at inside the furnace, but need not extend much lower than 6 to 9 inches below the level of the charge. If the brickwork is well laid in the pan (joints as close as possible) there need be no fear of the lead breaking through below the jacket, and as the water-jacketed belt on the pan holding the brick-
work extends above and below the limits of the level of the lead there cannot be any breakout there, for the erosion of the brickwork can only go to a certain depth, as it is then stopped by the cooling action of the water jacket. It is advisable to use bricks on end at the level of the lead, so built in that when the furnace is full the lead is about 1 inch down on the 9-inch faces of the bricks. This allows the lead to sink in the treatment process some 8 inches before its level reaches a horizontal joint.

At the skimming doors the water-jacketed belt is recessed down to the level of lead. The walls of the furnace need only be 9 inches thick. At the skim-
ming openings the brickwork is sloped away on each side to allow the tools to reach as much of the sur-
face of the lead as possible, and it also slopes down below the lead on the bottom edge of the door to make it easier to skim off the slag. The doors are simply plates of cast iron, sliding in a frame and counterpoised with weights. The brick bottom slopes to the tap hole so that all the lead will run out when required. At the tap hole end of the furnace

the water-jacketed belt comes down to below the tap hole which is pierced through it. Portion of the water required by the jacket is fed immediately under the tap hole so as to make sure of it being kept quite cool when the furnace is full of red hot lead. Before charging the furnace the tap hole is filled with a plug of fireclay, and the latter is held from being pushed out by a 1/4-inch iron plate fitting into grooves cut in the launder or spout which carries the lead to the zining or desilverizing kettles. It is apparent that the security of the stopping-in of the tap holes is very important.

In some refineries where the softening furnace is not fully emptied of its contents, a different arrange-
ment for the tap hole is used. The main water jacket is extended down in the same manner as be-
fore described, but it is pierced with an 8 or 9-inch circular hole; through this a water-jacketed tuyere 9 inches long is passed and fastened in place, clay being well rammed in between it and the bricks on the inside of the furnace to stop up any space left. This tuyere has a separate water supply, and the opening through it into the furnace is about 2 inches at the outside and may taper to 1 1/4 inches or less at the nose. To close it, a soft pine plug 12 inches long and properly shaped to fit the hole is driven in tight. The constant stream of cold water circulating in the tuyere prevents the hot lead from burning out this plug. When the furnace has to be tapped a hole is bored into the wooden plug for a distance that expe-
rience teaches is safe, and a few blows of a thin bar passed into the augur hole will let the lead flow. A fresh wooden plug is used at each stopping. With this kind of tap hole accidents happen occasionally at the tapping; the workman bores the augur too far, and before the iron launder can be put in its place a spouting stream of red hot lead comes rushing out of the furnace. Of course, no one can get near it and the result is that the whole contents of the furnace run all over the place, causing delay and expense in cutting up the lead in sizes fit to handle to remelt it. Everything must necessarily be of iron in the immediate vicinity—posts, floors, etc., or else such an accident would result in the destruction of the plant.

The Work of Softening.—The furnace is charged im-
mediately the previous charge has been tapped into the desilverizing kettle. The bullion may be put in at once, or in several portions, it matters little which method is followed; it is melted down very slowly: sweated down describes the operation per-
fectly. In this way the more infusible copper-lead alloy separates out and floats on the bath of lead which has formed underneath it; the dross is stirred up with a two-pronged rake every few minutes to expose fresh surfaces to the heat, and so get as much lead as possible melted out of it. If the fur-
nace is overheated in this operation some of the dross is melted into the lead again, and will not sepa-
rate out unless the furnace is chilled down. An ex-
cess of fine coal used in the attempt to "dry" the dross, i. e., expel the lead, will create too much heat, and with the reducing action of the carbon the same result happens. The effect of copper being left in will be shown later on. No matter how carefully the work is done, however, some copper always remains in the lead, but not in a sufficient quantity to do much damage. The time absorbed in the charging of the furnace, sweating the bullion down, drying the separated dross and skimming it off, occupies from five to eight hours, according to the amount of cop-
per present in the bullion being purified. The dross skimmed off is dropped into a slag pot, with a hole bored in it about 6 inches from the bottom. Consi-
derable lead is usually withdrawn with the dross. When full of skimmings the slag pot is wheeled over a couple of moulds and the lead poured out through the hole. This lead is returned to the charge in the furnace and the dross sent to the blast furnace for retreatment.

A series of assays of copper dross, with the assays of the bullion from which it was produced, are as follows :

| No. | Bullion Assay Per Ton. | | Copper Dross Assay. | | | |
|-----|------------------------|----------|---------------------|----------|----------|-------|
| | Ag. Ozs. | Au. Ozs. | Pb. % | Ag. Ozs. | Au. Ozs. | Cu. % |
| 1 | 143.03 | 12.25 | 63.10 | 67.36 | 6.00 | 5.1 |
| 2 | 168.68 | 12.00 | 66.06 | 53.46 | 5.66 | 3.8 |
| 3 | 117.49 | 12.92 | 60.70 | 41.31 | 1.32 | 1.8 |
| 4 | 118.04 | 12.48 | 69.10 | 39.86 | 1.32 | 1.5 |
| 5 | 121.16 | 14.78 | 73.50 | 60.66 | 1.49 | 3.6 |
| 6 | 105.30 | 11.28 | 54.10 | 38.24 | 0.54 | 1.9 |
| 7 | 117.42 | 13.52 | 72.70 | 53.67 | 3.53 | 3.9 |
| 8 | 114.08 | 11.95 | 76.80 | 52.40 | 4.92 | 6.4 |
| 9 | 81.12 | 6.61 | 67.60 | 43.77 | 6.76 | 1.8 |
| 10 | 115.30 | 11.26 | 60.70 | 37.86 | 6.78 | 3.3 |
| 11 | 148.54 | 16.94 | 68.80 | 58.14 | 5.86 | 1.5 |
| 12 | 220.02 | 21.98 | 73.50 | 62.24 | 6.48 | 1.4 |
| 13 | 179.40 | 42.28 | 82.40 | 60.96 | 10.00 | 1.5 |
| 14 | 139.32 | 16.08 | 62.40 | 35.56 | 16.00 | 6.1 |
| 15 | 340.04 | 37.38 | 62.20 | 87.34 | 8.40 | 1.9 |
| 16 | 157.34 | 16.52 | 70.80 | 28.98 | 2.86 | 1.4 |
| 17 | 141.53 | 14.30 | 71.00 | 31.20 | 3.36 | 1.1 |
| 18 | 121.74 | 12.94 | 78.40 | 53.08 | 6.00 | 1.6 |
| 19 | 132.72 | 12.90 | 76.10 | 60.06 | 7.50 | 1.7 |
| 20 | 246.38 | 24.04 | 60.80 | 114.14 | 20.44 | 9.3 |
| 21 | 154.52 | 13.34 | 75.10 | 48.56 | 5.44 | 2.6 |

From these assays it will easily be seen that two conditions decide the gold contents of the copper skimming, first, the assay of the bullion, and secondly, the copper contents of the dross. When both are combined, as in assays Nos. 14 and 20, the amount of gold and silver withdrawn in the dross is

rather serious, and it cannot be avoided in any way. I say serious, because after having gone to the ex-
pense of getting the gold into the bullion in the blast furnace operation, it is expensive to send it through the blast furnace once more in the copper dross.

Immediately the lead is skimmed clean of copper dross, the heat is raised considerably. Very soon a tin and arsenic skimming begins to appear. Its ap-
pearance is altogether distinct from the half pasty, black, copper dross; it is quite dry and resembles particles of clay, etc., which might have floated up off the bottom of the furnace. In an hour or so, this tin-arsenic dross may be skimmed off. It contains a little copper and the amount of tin in it (generally derived from the scrap "tin" used in the blast fur-
nace) is not worth saving; it may be weighed and put with the copper dross for retreatment in the blast furnace. Usually there is very little of this product. If the copper dross weighs a ton, the tin skimming may weigh a little over 200 lbs. After the tin skimming is removed the heat is further raised and occasionally a second tin skimming, small in quantity may rise. It is skimmed off and put with the other drosses. On further raising the heat, antimony begins to appear in black, boiling, oily drops, in time gathering together and forming one sheet all over the face of the lead. As the extraction of the antimony depends on oxidation, it is not ad-
visable to let too thick a coating of the antimony dross form. Therefore as soon as the face of the lead is covered with about half an inch of skimming, the fire door and the furnace doors are opened to cool off the furnace, and some slaked lime or ashes are thrown into the furnace on top of the oily slag of an-
timony. If this is stirred in with a two-pronged rake the antimony soon thickens up, and may be skimmed off easily and with a minimum loss of lead, using, of course, a perforated, rectangular skimmer. Time is also saved. After the first antimony slag has been taken off, the fire is urged once more for about an hour to two hours, the charge being well "worked" or stirred every fifteen minutes, and then another skimming will have formed and is removed in the same manner as that already described. As many as nine antimony skimmings may come off a fifteen-ton charge if the bullion is particularly dirty. The great point to bear in mind is to constantly stir the charge up, so bringing fresh surfaces to the air and hast-
ening the oxidation of the antimony. Steam deliv-
ered from a nozzle, or compressed air, is also used in some works for the purpose of hastening on the antimony separation. I have used steam, and my experience is not a satisfactory one. It certainly hastens the oxidation, but the spray of small drops of lead and skimming beating on the roof and sides, and the waves on the face of the lead caused by the jet of steam or air impinging on it, cut away the brickwork in disastrous fashion.

When the workman wishes to see how the elimina-
tion of the antimony is progressing, he takes samples of the skimming from time to time with an iron ladle about half an inch deep and an inch and a half wide. On letting the sample set hard it is broken in half; if the fracture shows a black, vitreous appearance, it indicates plenty of antimony yet in the charge. Later samples will look less black, and finally in the center of the sample a few tiny, yellowish streaks may be seen. This is the first appearance of litharge and also an indication that the charge is nearly "cooked." The next skimming will usually bring the charge ready for a litharge skimming to be "run." When this begins to form the lead gets a dappled appearance on it. It appears to form first immediately under the bridge. It melts like oil but shows the dappled look, and, if closely watched, the molten streak will be seen to pass right down the furnace to the flue end, and then come back up the furnace again. The litharge sets behind the streak as it goes down and up. By the time the streak of molten litharge comes back to the bridge, the skim-
ming of litharge will be a little over a quarter of an inch thick. A sample is taken out on a paddle and when cold is broken to see its appearance. If the antimony is all out the fracture should be quite yellow and the grain or crystallization of litharge long; a short grain indicates impurities still left in. In the latter case a second litharge skimming is some-
times "run." When the charge is clean the doors are thrown open to allow it to cool down to the cor-
rect temperature for tapping into the kettle.

| ASSAYS OF ANTIMONY DROSS PRODUCED IN THE SOFTENING PROCESS. | | | | |
|--|---------|-------|---|-----------------|
| Ag. Oz. | Au. Ozs | Pb. % | Pb. in metallic form included in previous column. | Sample of tons. |
| 15.24 | 1.70 | 48.20 | 1.8 % | 2.90 |
| 15.81 | 2.17 | 47.40 | 1.2 | 30.00 |
| 13.43 | 1.46 | 47.40 | 1.2 | 34.00 |
| 12.91 | 1.41 | 51.80 | 1.2 | 30.00 |
| 15.87 | 1.85 | 51.40 | 2.0 | 40.00 |
| 16.47 | 2.08 | 48.20 | 1.4 | 15.00 |
| 18.27 | 1.94 | 48.70 | 1.3 | 18.00 |

It may be added that the addition of litharge obtained at the end of the softening of the base lead and from the cupel furnaces considerably assists the production of antimony skimmings.

(To be Continued.)

* Australasian Institute Mining Engineers.

An English Colliery Ventilating Engine.

By way of variety is herewith reproduced from the *London Engineer* an illustration of an English ventilating engine, said to be the largest in use, and in operation at Garswood Hall colliery, Brynna. Its ventilating capacity and that of the fan is 500,000 cubic feet of air per minute, with 6 inches water gauge.

The machine is a two-cylinder compound condensing engine, stroke 5 feet. The high pressure cylinder is 26 inches in diameter, the low pressure 48 inches in diameter, steam pressure normally 100 pounds (probably the gauge or boiler pressure).

The engine is of the ordinary slide-valve type, fitted with expansion valves, in both the high and low pressure cylinders. These valves change the cut-off while the engine is at work and are in frequent use in England. The builders of this engine consider slide-valve engines preferable in mine ventilation, on account of their simplicity, reducing the liability to break down.

The engines are connected so that the cylinders may be operated separately, as simple engines; but if the low pressure cylinder is required to work alone the steam pressure is expected to be reduced through

admits steam through the opening in the center of stem of valve *C* to expansion chamber, where it acts upon the piston *D*, the area of which being larger than that of valve *C* forces same from its seat, and allows the steam to pass through the valve. As long as the auxiliary valve *A* is held open, the main valve *C* will be kept off its seat, and the valve will be open. When the pull on the lever is released the pressure of the steam closes the auxiliary valve *A*, and the main valve *C* closes easily and without shock or jar, as the steam which is entrapped in the expansion chamber tends to cushion and retard its movement. There is very little wear on the two valve seats, and they can be easily reground by taking off cap at end. These whistle valves are made by the Lunkenheimer Company, Cincinnati, O.

The Study of Coast Weather Conditions.

Written for the PRESS by L. E. BLOCHMAN.

Origin of the Weather Bureau.—Observations on the weather are more common, though less definite, than any other science. The results of accurate weather forecasts are of more intrinsic value than almost any other subject, but the subject does not receive its just attention from the Government to

at Washington, whence the name "Signal Service." It was only in the early '70s that sufficient data had been accumulated to justify the Government in maintaining a regular corps of observers and in establishing a permanent weather bureau. Since that time slow but very steady growth has been made.

Local Weather Forecasts.—The weather on this coast has idiosyncracies of its own, certain characteristics, on account of the influence of the Japan current and our mountain barriers, that make it essentially different from Europe or the States east of the Rockies; it is, therefore, a study by itself. The Signal Service charts the coast twice in twenty-four hours, through telegraphic communications from the several Government weather bureau stations. From these reports, of barometer-thermometer-wind-and cloud conditions, prognostications of one to two days are made by the two head officials west of the Rockies—one in San Francisco and one in Portland. The accuracy of their predictions depends on experienced observations and also on the number of stations that the Government makes available.

Some Rain Conditions.—Rain-bearing areas are borne in upon us from the Japanese current. In summer these strike way into the northward, and we do not feel their influence. In winter and spring

ENGLISH COLLIERY VENTILATING ENGINE.

a reducing valve. The fan is 30 feet in diameter and 9 feet wide across the vanes, and is driven by ropes from a 24-foot fly-wheel.

Automatic Balanced Whistle Valve.

In the Lunkenheimer automatic balanced whistle valve the disc is balanced and closes firmly without

shock or jar. In opening, the steam pressure acts upon the valve disc in such a manner that the disc is raised from its seat almost automatically.

Reference to the sectional cut will show its operation. The steam pressure on top of disc *C* normally holds it to its seat. A slight pull on the lever *X* is sufficient to open the small auxiliary valve *A*. This

the civilian. As late as 1855 nothing was known about scientific weather predictions. In that year of the Crimean war a fearful storm raged in the upper Black sea. It made havoc with the English shipping at the memorable siege of Sebastopol. But the then remarkable fact was observed that a day or two before an equally destructive storm struck in from the Atlantic and crossed over France. The storm that entered France was the identical one that afterwards, traced over the intervening land, was the fatal Sebastopol storm, and which, had the nature of storms been known, could have been forecasted. This was an eye-opener to the French savants. They traced up the storm by its moving low barometer area with high barometers preceding and succeeding it, and by the clouds and the changeable winds that were influenced by its movements. Thus began the scientific study of weather conditions. After observing certain invariable conditions that preceded these storms, they could forecast them several hours and finally a day or two ahead and warn people of their approach. Gradually other weather conditions were studied, other governments also entered into it, and predictions became accurate enough to be the basis of an exact science.

Our country, however, was rather later in the study and forecast of weather conditions. Following our Civil War, in the '60s, some few signalling officers were retained at certain stations to take weather observations and to report these telegraphically to one of the War Department headquarters

these storm areas usually strike in from Vancouver to northern California. Their usual trend is ther eastward; but when high, or resistant, barometers hang over the mountain and plateau regions, these storm areas are subject to deflection, and they trend down the coast. How far down the coast they will trend, is the question.

The firmness, or the yielding, of the high barometers over the plateau region now figures as the determining factor of the trend of these storms. There are a great many other factors about the storm area. It may have flattened out before reaching the coast and strike in more directly at a lower point as well which is foretold by the action of barometers adown the coast. It may also be reflected back again on the ocean and come in at a lower or a higher point referring to this peculiar condition that took place on the 25th and 26th of Sept., '98. These reflected storms are not at all uncommon up north, but they are very uncommon below the central part of the State, when accompanied by such heavy rainfalls.

Tracing Up an Early Storm Area.—The Weather Bureau does not consider any distant forecasts official. To myself, who have observed weather conditions in this one locality for seventeen consecutive years, the action of the weather from the middle of September till December is an instructive study. The first rains south are of particular interest. Eventually, as data accumulates, they may have considerable future weather forecast value.

We will follow up the first storm that struc

southern California this season. No heavy rain-falls usually trend down south till the latter part of October, and more generally not before November. They are also usually deflected down the coast, trending down with diminishing rainfall. But the storm area of Sept. 25th and 26th had a different course. About the 20th of September the first storm area of this season struck the Oregon coast; hung on over Washington and Oregon for a few days, making but a slight deflection towards northern California. Three days of south winds in California told of the influence of the storm, with rather light rains in the northern half of the State. By the 24th its influence had passed away; with depleted moisture it was passing over the mountain regions toward the east. But on the wake of this storm another seemed to follow. As the next storm approached the Oregon coast it hesitated on its course. This was told by the barometer which had been falling and then abruptly stopping short. The Weather Bureau noticed this and knew from previous observations that the storm would then be reflected back again on to the ocean, divided up and later at some other points. But they did not know where; nor is it to be wondered at. The storm area struck in centrally half way between San Luis Obispo and Los Angeles, and there is not a single weather bureau station between these two points, about 300 miles apart. The main part of this storm area in being reflected back became contracted in width, with the usual result of giving an intensive rain along the center of its course and little or no rain at 40 miles on either side. In January, 1894, we noted one of these contracted storm areas strike Sonoma county centrally and give a precipitation of 10 inches, causing creeks to overflow and a serious railroad accident. In San Francisco, within 40 miles, the rainfall had decreased to about one inch.

This last September rainfall struck southern Santa Barbara county centrally, took a northeasterly course and spread out a little more and afforded heavy rains for northern Kern, Tulare and a part of Fresno counties, passing thence due east over the mountains. At San Luis Obispo the rainfall was only .20 inch; at Santa Maria, thirty miles south, 1 inch; around Santa Barbara town 3 to 3½ inches was lodged; at Ventura a great deal less; at Los Angeles, nothing. In parts of Tulare county over 3 inches was reported, almost as much as the whole of the previous dry season. The impulse of the storm forced this extraordinary rain for even the drier interior.*

The single inferential value of this peculiar storm that such heavy early rains do not occur in southern California in drier seasons. On the other hand, when these storms come in thus early in the season, there is quite an interval before the regular rains set in, and which we may now look for.

We are also citing the history of this storm for another purpose—to evince the neglect and indifference that scientists show toward the study of meteorology. Every flower and plant that is seen is catalogued and scientifically described; every new chemical combination, even of indifferent value, is carefully noted, catalogued and accounted for. The same minutiae applies to every other science except meteorology, or rather that particular branch of it which refers to the climatology of this Pacific coast. Even the Weather Department is too conservative study recurring weather conditions with reference to distant prognostications. Before the middle of this century it was considered entirely unscientific to predict weather twenty-four hours ahead; now it is found to be a real science, and the certainty of predictions is with the accumulation of facts steadily increasing.

The Possibility of Distant Forecasts.—We realize that there are too many uncertainties entering into distant weather forecasts to as yet afford any scientific accuracy. But we must recollect that all science is at first tentative—mere theories for a few facts or for a few observations that seem at first but slightly related. Years of casual observation of weather seemed to me, after all, barren of results, but within recent years by observing the barometric character of weather, summer as well as winter, together with other observations, a few salient characteristics of wet and dry seasons are shaping themselves. When these characteristics shall have been accurately enough ascertained, their prevalence will be a determining factor as to the general shaping of the season—wet, average or dry. But the problem is not so simply disposed of. Let us illustrate: Barometric conditions for November and December, '95, were similar to those of November and December, '97, and the weather at first acted much the same for both seasons. But in the middle of January, '96, the weather changed and a heavy storm area entered central and southern California, which changed the "phase of the weather," but no such change came over the past year. This "change of phase" is the unknown element in weather predictions. It is as yet the unknown quantity that perplexes us for a solution.

We are just now on the threshold of investigating

distant prognostications, where the French scientists were in 1854 regarding immediate forecasts.

Meteorology and climatology are the latest of the sciences in progress of development. There are so few votaries of the subject and so few facilities for study, and the problems presented are so difficult, that but few enthusiasts will give the subject any attention.

There is, however, one element in our favor, the comparative placidity of the broad Pacific and its atmosphere, in which both our storms and calms originate; also our northern and eastern encircling mountain barriers, warding off the uncertain effects of northern colds—always an unknown factor East. We are conditioned by the direction and temperature of the Japan current, which can now probably be studied months ahead on the Alaskan islands. We have yet to determine what is summer normal, barometrically and otherwise. Suffice it to say just here that last season a different barometrical condition prevailed in Oregon last July and August from what has prevailed this season. Therefore the pulse of our ocean atmosphere has to be determined before we can begin the solution of this difficult problem.

A Little Bunch of Questions.

An average of 100 different questions are received by the MINING AND SCIENTIFIC PRESS every week. Some are answered in "Concentrates," more by mail; others are impossible of satisfactory answer. The following letter illustrates how they come. It is printed just as received:

(1) Given a belt moving rapidly, generating considerable electricity, where are the points of greatest difference of potential—near the pulleys or not, inside the belt or outside?

(2) What title have the owners of the oil wells described in the issue of Oct. 15th?

(3) Is there such a thing as a premium on gold bars above a certain fineness?

(4) Have you ever published a form of working bond?

(5) Did you know that a not unusual temperature here in summer is 123° in the shade?

Hedges, San Diego Co., Cal., Oct. 24th, '98.

Answers.—(1) Midway between the pulleys; on the inside of the belt.

(2) Titles to the Summerland oil field: Above ordinary high water mark is part of the pueblo lands of Santa Barbara, Cal., patented to the city of Santa Barbara and now owned by a number of people. Between ordinary high and low water mark, being the sandy beach of Santa Barbara channel, belongs to the State of California. We do not believe the State has passed any act by which private individuals can acquire the title to these lands for mining purposes, but suppose the party in possession can maintain the same as against any other party except the State. Below low water mark belongs to the United States, and it is presumed it is in the same situation and is governed by the same conditions as the property of the State as given above.

(3) No.

(4) On page 354 of the issue of May 2, 1896, appear three elaborate blank forms of mine working bond.

(5) Yes.

Gold Nuggets From Mexico.

W. S. Keyes who recently returned to San Francisco from a professional visit to Mexico, brought with him photos of two gold nuggets from which the

engravings herewith presented were made. They are from the placer ground of Felton Bros., five and one-half miles from the bank of the Sinaloa river, near Bacubarito, Sinaloa, Mexico, seventy miles from the Gulf. The smaller weighs 21 oz., the large round one 33 oz., worth \$18 per oz. The Felton Bros. have there 1600 pertenencias of 2.47 acres each. The river there makes a fourteen-mile loop, the distance across its narrowest part being but 750 feet, and over 100 men are making good wages with dry washers, besides the force of men tunneling to bottom the channel.

Questions and Answers in an Assaying School.

Written for the MINING AND SCIENTIFIC PRESS by O. H. PACKER.

Noting a discussion in some Eastern mining journals on the subject of "competency of practical assayers" vs. "students of assaying in our schools of assaying," I was led to make comparisons myself. A number of men with whom I conversed, and who called themselves assayers, were devoid of knowledge of the chemical properties of the fluxes used in assaying and of the reactions taking place in the furnace. My students have frequently checked the work of the Selby Sampling Works, agreeing within a few cents. I append a set of examination questions given at the end of a two months' course in assaying. The answers were by N. Peart, a student, who had no previous knowledge of chemistry or assaying:

Question 1.—Name the fluxes and re-agents used in the fire assay, giving the action of each.

Ans.—The chief fluxes and re-agents used in the fire assay are, (a)—Litharge (PbO). This is used in the crucible assays of gold and silver ores and is composed of lead (plumbum) and oxygen, one part of each. It is used to supply lead. The litharge on being fused in the crucible gives up its oxygen which unites with other metals as iron, copper, manganese, zinc, tin, etc., converting them into oxides, and these oxides being more fusible than their corresponding metals are slagged off with the gangue. The lead on being freed from its oxygen is distributed throughout the crucible, absorbing the precious metals, as gold and silver, sinking with them to the bottom. Thus, litharge serves two purposes—an oxidizing agent and taking care of the gold and silver.

Litharge contains 93% of lead.

(b)—Granulated lead is used chiefly in the scorification assays of gold and silver ores. In the scorifier a part of the lead is oxidized and volatilized. The volatilized lead takes with it particles of copper, arsenic, antimony and tellurium. Thus, a particle of any of these metals may be mechanically carried off by two particles of lead.

In this case, as in the case of litharge, the lead cares for the gold and silver.

(c)—Bicarbonate of soda (NaHCO₃).

This is ordinary bicarbonate that is bought in the stores and can't very well be done without in the crucible assays of gold, silver and lead.

Carbonic acid is H₂CO₃, and the sodium only takes the place of one atom of H in the acid. This is an oxidizing agent, that is, it gives up its oxygen to other substances, converting them into oxides. It is also a basic flux, requiring an acid to form a fusible salt. For instance, it would form with silicic acid a salt called silicate of soda. It is also a desulphurizing agent, i. e., takes away the sulphur from its combinations to form sulphate of soda. It also makes a thin slag and helps to keep the side of the crucible clean.

(d)—Carbonate of potash (K₂CO₃). In this case the potassium takes the place of both atoms of hydrogen. This has the same action as NaHCO₃, oxidizing, basic and desulphurizing.

(e)—Borax (Na₂B₄O₇).

This is the ordinary borax glass minus its water of crystallization, which is from 30 to 47%.

This is used in both the crucible and scorification process for gold and silver ores and also in the lead assay.

This is an acid flux, that is, it requires a base to form a fusible slag. Ores containing a large percentage of basic gangues, as lime, heavy spar, fluor-spar, magnesia, baryta and alumina require a larger quantity of borax and silica to flux them.

(f)—Silica (SiO₂). This is also an acid flux and as the percentage of base material in an ore increases so should the quantity of silica be increased in assaying it.

(g)—Nitre (saltpetre, nitrate of potassium or potassium nitrate KNO₃).

An oxidizing agent; basic flux and a desulphurizing agent.

(h)—Charcoal is a reducing agent. Consisting mostly of carbon, it reduces the litharge to lead and neutralizes the action of oxidizing agents. One part of charcoal reduces from 24 to 32 metallic lead.

(i)—Flour is a reducing agent, consisting mostly of carbon.

(j)—Black flux substitute (10 NaHCO₃) : (3 flour) is a reducing agent.

(k)—Potassium cyanide is a reducing agent. KCN.

(l)—Carbonate of ammonia (NH₄)₂CO₃ is chiefly used in aiding the roasting of "copper pyrites" ore. It is a desulphurizing agent.

Argol (KHC₄H₄O₆) is a reducing agent.

Iron, generally used in the shape of iron nails, is a desulphurizing agent.

Question 2.—What is meant by "oxidizing" an element? By "reducing" a compound?

Ans.—By "oxidizing" an element we mean that

On the crest of a storm area is a high barometer. The retarded movement of the first storm area on reaching land allowed its high barometer end to reflect back the incoming storm.

another element called oxygen is supplied to this element and is chemically combined with it, forming a compound. It is done by both natural and artificial means. Metallic iron exposed to the air absorbs oxygen therefrom and a reddish brown powder may be noticed on the surface. In a crucible assay we add nitre (KNO_3) to oxidize or keep oxidized the lead of the litharge. By "reducing" a compound we mean taking away the oxygen from a compound, reducing it to its metallic state. Thus, charcoal reduces litharge to lead—(PbO to Pb).

Question 3.—How would you vary the charge for varying amounts of copper in an ore to be assayed for gold and silver? What is the difficulty in assaying for lead in presence of copper in the ore?

Ans.—In assaying ores containing copper (Cu) for gold and silver I would increase the amount of lead in the scorification assay and increase the amount of litharge for crucible assay.

In the crucible the oxygen in the litharge oxidizes the copper and as such it may be either slagged out or volatilized. I would also put in a little more Na_2CO_3 and $\text{Na}_2\text{B}_4\text{O}_7$ and SiO_2 , the latter especially.

More nitre (KNO_3) would also be required to oxidize the excess of lead to produce the proper size of button. The chief difficulty in assaying for lead in the presence of copper is liable to form a matte, making the button brittle. With copper in the lead button you could not get the proper percentage of lead.

Question 4.—What are the objections to the use of nitre (KNO_3) for desulphurizing and oxidizing an ore?

Ans.—Nitre (KNO_3) is a desulphurizing and oxidizing agent and has a drawback on account of its making the contents of the crucible boil, swell out and expand, sometimes making the contents of the crucible boil over the edge and so spoiling the assay. Great care should be taken when using it to avoid using too large a quantity, as a loss of gold and silver may result thereby.

Question 5.—How would you assay an ore for gold containing tellurium?

Ans.—In assaying for gold in an ore containing tellurium I would proceed in same way as for ore containing copper enumerated above. The difficulty lies in getting the tellurium out of the lead button. This is done by putting into a scorifier with more lead, if necessary, and scorifying till a button is got that is malleable and free from it. Button may take from one to twenty times its weight of Pb . If a button containing tellurium is put in a cupel and cupelled the silver and gold will be spread all over the cupel.

Question 6.—How would you ascertain the various minerals in an ore before assaying it?

Ans.—To ascertain the various minerals in an ore before assaying it, the only way to do is to test it in various ways before the blowpipe. Each mineral acts in different ways. This is termed blowpipe analysis.

Question 7.—Give the chemical symbols of all the re-agents used in assaying.

Ans.—Litharge, PbO ; lead, Pb ; bicarbonate of soda, NaHCO_3 ; carbonate of soda, Na_2CO_3 ; carbonate of potash, K_2CO_3 ; black flux substitute (10NaHCO_3) 3 flour; potassium cyanide, KCN ; carbonate of ammonia (NH_4) $_2\text{CO}_3$; argol ($\text{KHC}_4\text{H}_4\text{O}_6$); iron, Fe ; borax, $\text{Na}_2\text{B}_4\text{O}_7$; silica, SiO_2 ; nitre, KNO_3 ; charcoal flour, C .

Question 8.—What methods can you use for determining the per cent of copper in an ore?

Ans.—I can use these methods for determining the percentage of copper in an ore: 1. Electrolysis: In this method the copper is precipitated by a current of electricity upon a sheet of platinum. It is the most reliable method and more copper can be got by this than by any other method. 2. Volumetric: In this method a certain percentage of the copper solution is titrated with KCN until a certain color is obtained.

The KCN having first been tested against a standard solution of copper, by proportion find the percentage. 3. Precipitation: In this method the copper is precipitated by the addition of iron in the shape of iron nails, the acid having more affinity for iron leaves hold of the copper, which falls to the bottom in a metallic state.

Question 9.—Give an outline of the chlorine gas method for extracting gold from ore.

Ans.—In the chlorine gas method the ore is crushed, sifted in tanks and chlorine gas admitted to the bottom. The chlorine chemically unites with the gold, forming gold chloride which will dissolve in water. Water is admitted to the tank and the chlorine dissolved out of the ore. The gold is then

precipitated by the use of ferrous sulphate. The resulting gold sulphide is roasted and melted into bullion.

Question 10.—Why is a knowledge of chemistry and blowpipe analysis necessary for an assayer?

Ans.—A knowledge of "chemistry" and "blowpipe analysis" is necessary to an assayer because by the application of these sciences he can find out

the belt, has been a steady producer since 1887. The Tiger shaft is down to the 1400 level, a perpendicular distance of 1200 feet. The lower workings of this property are better than they were near the surface. The Helena and Frisco, in the same canyon, is down a depth of 1000 feet vertically, and with the same conditions.

"Heavy mining machinery of all kinds is used,

HELENA AND FRISCO HOIST, COEUR D'ALENES, IDAHO.

exactly what an ore consists of, and can give it its proper name and treatment. By perseverance in this science he becomes adept in telling at once what an ore consists of and if it is likely to contain a precious metal. They are very interesting studies and they are progressive sciences, something new always cropping out and new laws being found out that are of great importance. The greatest man

there being two 20x60 direct-acting hoists now working in the camp, situated on the Tiger and Poorman and Helena and Frisco properties. These hoists are built to go to a depth of 2500 feet, and handle from 600 to 700 tons of ore per day, besides handling the waste and necessary mining supplies, and requiring from 500 to 600 H. P. to operate them.

"Pumps of a capacity of 1000 gallons per minute

DUPLEX DIFFERENTIAL RIEDLER PUMP, FRASER AND CHALMERS, FOR THE TIGER MINING COMPANY, COEUR D'ALENES, IDAHO.

nowadays in this progressive world is the scientist.

The above answers are just as given by the student. Though some corrections are necessary, I suspect few practical assayers would answer the questions any better.

Mining Machinery in Idaho.

Deep mining on the lead belt of the Coeur d'Alenes, Idaho, gives promise of permanency, justifying the placing of heavy machinery. F. R. Culbertson, manager of the Tiger-Poorman, writing of that property, says:

"The Tiger and Poorman, the first location in

pumping 1000 feet in one lift, are to be found in these mines. Some idea of the size of these pumps and the amount of power required to operate same, may be formed when it is considered that few cities of 20,000 population have larger water works pumps for supplying the city than these same pumps, which are used only for the purpose of keeping some of our mines dry."

Herewith is illustrated the pump at the Tiger, and the hoist at the Helena-Frisco, built by Fraser & Chalmers of Chicago. The pump is a duplex differential Riedler, plungers $4\frac{3}{16}$ " and $6\frac{1}{2}$ "x18", driven by a horizontal cross-compound pneumatic slide valve engine, 14" and $12\frac{1}{2}$ "x18", capacity 600 gallons per minute against a head of 750 feet when run-

ning at 120 revolutions, but can be run somewhat higher. The engines are seen from the cut to be provided with Meyer's gear, the differential construction effecting a double-acting discharge with a single-acting suction, simplifying water connections and securing the desirable double action of discharge. The suction chamber is large, and divided, having two flanges, part of the arrangement for running either side independently if desired.

The Helena and Frisco hoist is a duplex direct-acting double reel machine driven by a pair of 20" dia. x 60" stroke Corliss engines. The reels are 5 feet in smaller diameter, and take 2000 feet of 4½"x½" flat rope. The hoist is intended to lift a double-deck cage with load, and is fitted with steam-operated clutches and post brakes, engines having steam reversing gear.

All auxiliary steam cylinders have oil cataract cylinders arranged tandem to give steady and easy motion. Between the reels is a heavy center-bearing for crank shaft having the same adjustments as the main bearings of the engines.

Of Interest to Claim Owners.

An Arizona miner who recently wrote for information to the General Land Office at Washington, D. C., received the following answer:

You state that you own the possessory title to a group of five contiguous mining claims in Arizona, relatively situated as shown by the diagram you inclosed. You also state that during the present year you have expended one thousand dollars in a shaft and drift on one of the claims, and you inquire in effect whether the amount expended is sufficient to maintain your possessory right.

In the first instance, it should be stated that, for obvious reasons, it is contrary to the policy of this office to undertake to render a binding decision upon an important question arising under the land laws, except in an actual case regularly submitted for adjudication upon the proven facts.

In order to legally hold the possessory right to a mining location not less than one hundred dollars' worth of labor must be performed or improvements made thereon annually until entry shall have been made.

In the case of Chambers et al vs. Harrington (U. S. 350) the United States Supreme Court held, syllabus:

When several adjoining claims to mineral lands are held in common, work for the benefit of all done upon one of them in a given year to an amount equal to that required to be done upon all in that year meets the requirements of Sec. 2324, U. S. Rev. Stats.

In the case of McNeil et al. vs. Pace et al. (3 L. D., 267), it was held: When the parties owned two adjoining claims and a drift in one of them was run in the direction of the other, under the advice of mining experts, with a view to the improvement of both, it is available for holding them both.

In the decision in the case of Dolles vs. Hamberg Consolidated Mining Co. (27 L. D. 269), the honorable secretary used the following language:

It is a well settled rule that where parties hold adjoining claims the annual work may be done on one of them, if such work is designed for the improvement or development of the group. But the burden of proof is on the owner to show that the work done or improvements made does, as a matter of fact, tend to the development of the property as a whole, and that such work is a part of the general scheme of improvements.

"LIFE IN THE COLDEST COUNTRY IN THE WORLD" is the latest bulletin of the Royal Geographical Society of Irkutsk. The name of the place is Werchojansk, in Siberia, longitude 133° 51' east, latitude 67° 34' north, where the lowest temperature of minus 90° Fahr. has been observed and the mean of January is minus 48° Fahr. It is inhabited by about 105,000 persons of the Yakut and Lama races. In a large part of the region, according to Prof. Kovalik, the air is so dry and the winds are so rare that the intensity of the cold cannot be fully realized. In the most distant part of the east there are sometimes terrible storms, which are most fatal to life in their consequences. During the summer time the temperature occasionally rises to 86° Fahr. in the shade, while it freezes at night. The latter part of the season is often marked by copious rains and extensive inundations, which invariably lay waste a vast acreage of land and prove to be a serious obstacle to the cultivation of the soil. Vegetation is very scanty. There are practically no trees—only wide, open meadows. The people hunt fur-bearing animals, fish and raise cattle and reindeer. It requires eight cows to support a family. The cattle are very small in size and are fed with hay in winter. Occasionally they are allowed to go out when there is the slightest break in the weather. Milk is the principal food. This is sometimes supplemented with hares, which are abundant, but not very relishable. The houses are constructed with wood covered with clay and, as a rule, consist of only one room, in which the people and animals live together.

Electric Safety Lamp.

There has recently been devised a portable electric safety lamp for use in special cases when an open flame or even one safeguarded, as in the miner's lamp, would prove dangerous. The combination consists of a dry battery arranged to be carried in a holder at the belt or in the pocket. The battery is controlled by a small rheostat, maintaining an even supply of current to the lamp and allowing it to burn with the same brilliancy during the life of the battery. Changing an exhausted for a new battery involves no electrical knowledge. The electric lamp,

connected to the battery by a flexible cord, is the miner's lamp manufactured at the Edison Lamp Works of the General Electric Co. It is of six-candle power, and is set in a small white enamelled parabolic reflector, provided with a stick pin to allow it to be attached to the hat or any part of the clothing. The light is strong enough to allow ordinary matter to be read at a distance of 100 feet from the lamp.

The combination is manufactured by Elmer E. McIntyre of Pittsburg, and has been found very useful by gas inspectors in reading meters in dark cellars; by repair men exploring cellars and trenches for gas leaks and defective pipe connections or examining gaseous sewers; by miners and mine inspectors in gaseous mines, where the risk of explosion even from the miner's lamp is ever present; by watchmen in powder mills and warehouses storing inflammable oils and essences, or by workmen repairing oil and gas tanks or examining the riveting inside steam boilers. This lamp is especially valuable as it leaves the hands free, and its weight is so small—about two pounds—as to be hardly noticeable.

Standard Ore Cars.

The illustration herewith shows a mining car with Anaconda patent self-oiling axle and wheels, as manufactured by the American Engineering Works, 204 Dearborn street, Chicago, Ill. The car as shown in cut weighs 1000 pounds; capacity, 16 cubic feet.

These cars can be supplied with any size wheels that may be desired and for 18, 20, 22 or 24-inch gauge track. The car body rests on a cast-iron bolster and turn-plate bolted to the truck, permitting the car being swung in any direction desired, and the contents dumped sideways or endways. The discharge door in front is hinged at the top and operated from

the rear end with a wrought-iron handle fixed to the latch-rod, placed under the car body, by which the car can be locked or unlocked. The car body can be made of such thickness of steel as may be ordered, the manufacturers generally using 1½" for sides and 1" for bottom.

A Montana Jury Declares "Slag" Is "Tailings."

Recently, at Butte, Montana, the Butte & Boston Co. sued the Montana Ore Purchasing Co. for \$50,000 damages for tailings dumped on the ground owned by the former company. The case was tried in the United States Court before a jury.

The point in the controversy was as to the meaning of the word "tailings," and whether slag or the refuse of a smelter could be considered tailings. Supt. Heinze made an agreement in '92 with the superintendent of the Butte & Boston by which the former was given permission to dump tailings on a part of the Butte & Boston ground. Subsequently the Montana Ore Purchasing Co. built a tramway from its smelter to dump its refuse on the same piece of ground. The Butte & Boston Co. objected on the ground that the refuse from the smelter was not "tailings." The judge said "the term tailings does not in a general sense include slag from smelters." The matter was submitted to the jury to determine whether or not the word tailings included slag, and if such meaning was intended when the contract was made and the lease on the ground given to Heinze.

The judge, in his charge, declared that the ordinary meaning of the word tailings does not include the word slag. In mining, tailings are ordinarily understood to be the refuse matter eliminated from ore by means of water. In gold placer mining the tailings are the sand and gravel eliminated from the gold by means of water. It was claimed in the case that the word "tailings" has a scientific meaning and that this includes slag from a smelter. Another witness claimed that that word had no scientific meaning. A third witness said that in books upon metallurgy the word slag was always used as the refuse from the smelting of ores and tailings from the concentrating of ore by means of water.

After puzzling over the question for four hours, the jury brought in a verdict "for the plaintiff for the ownership and possession of the ground in controversy, subject to the leasements of the defendant, granted by the agreement of Nov. 16, 1892, in evidence, and assess plaintiff's damages at the sum of \$1."

The special findings of fact were as follows:

"Has the term tailings a scientific meaning?"

Answer—"Yes."

"If it has such scientific meaning, does it, in such scientific meaning, include the term slag?"

Answer—"Yes."

The verdict throws the costs on the Montana Ore Purchasing Co., but is in their favor, as it declares that slag is tailings, and the defendants will thus be allowed to dump the waste product of their smelter on the leased ground.

How Tacks are Made.

One of the first processes in the manufacture of tacks, remarks an exchange, is that of pickling the Bessemer steel or best quality iron sheets. These sheets are about 16x36 inches or 20x36 inches in size, and quite thin. The pickling solution is of blue vitriol, which removes all foreign substance and renders the metal more pliable to work. A bath of hot lime thoroughly dries the sheets, which are next taken to the cutter, when carefully arranged steel knives cut them into any width desired, ranging from ¼ inch to 2 inches. Each strip retains its original length. The strips now have jagged edges, but after going through a powerful machine the rough edges are removed, leaving a very smooth surface.

The strips are now ready for the tack machine, the knives of which cut the strips into the thickness required. Each little piece of metal as it leaves the knives is forced into a two-sided groove that closes tightly and gives to the tack the point and corrugations which lend to its holding qualities. At the same time a hammer strikes the broad end of the tack, putting a head on it, and then it drops into a receptacle beneath. The tack is now complete, save placing it in a revolving barrel or tumbler, which gives it a bright finish. Blue tacks are colored by heat, and tinned tacks after being dipped in the metal, having been previously pickled, are riddled and sieved together in a circular drum to prevent their sticking together.

Mining Summary.

ALASKA.

Four thousand dollars in gold is reported to have been taken from an 8-foot hole on C. P. Dyer's Gold Standard group on Cleveland peninsula, sixty miles south of Wrangle. Dyer is in Tacoma, Wash., and has this gold in the form of a brick worth \$3500 and some ore specimens which are filled with nuggets and wire gold. The gold was pounded out in a mortar in less than a month. An arrastra has been erected at the mines.

Navigation on the Upper Yukon river, between Dawson and the lakes, has closed for the season, and all the river steamboats have gone into winter quarters. Thirty Klondikers who left Dawson on Oct. 10th on the steamer Flora report that the Flora was the last boat to leave Dawson. The Yukon was filled with running ice, and it would be impossible to make another trip.

W. V. Radley, who spent two months in the Atlin Lake district, says there are good working prospects, but it is not a country from which any man is likely to take out \$100,000 in a season. If a man works steadily and takes out \$5000 in a season, he will have met with good luck. Claims will have to be bought; some will probably pay 50 per cent, while the majority will only pay about 20 per cent. The gold area may extend from Atlin or Pine creek to Teslin lake and Salmon river up to Lake Le Barge, covering the Marsh lake and Tagish country. Quartz properties are also met with and some free-milling quartz was found forty miles from Atlin. The snow is low down and before they came out the party camped three days in the snow at the head of Spruce creek, which had almost stopped work. R. S. Weeks, another pilgrim from the new gold fields, tells of a stampede to Lake Davis from Pine creek, which will in all probability, he says, result in great suffering for a number of the stampedeers. It was one of the most idiotic expeditions that ever I heard of, said Mr. Weeks. We had to carry our boat ten miles up Pine creek along with our provisions, a fearful job. We reached Surprise lake and rowed across, thirty miles. From there we had to pack our outfit ten miles further to Lake Davis. It is a large body of water, probably 100 miles long. We went up and down the shores for twenty-five miles, but could find no traces of gold. We met several who were almost out of provisions. Two had only a pound of rice and a pound of sugar on which to make the return trip. Out of the 200 that rushed in many are now suffering.

Reports come of the discovery of beds of copper on the Dalton trail, 100 miles inland from Haines mission. The find was made by Capt. Jarvis of the Canadian mounted police. The copper runs about 23 per cent and contains an average of \$46 to the ton in gold. It is mostly cuprite and gray copper, although some is native.

Juneau Miner: During the past season development has progressed on the California and Scotia lode at Berners bay, owned by J. G. Davies and others. One tunnel has been driven on the vein 100 feet, and another 108 feet. The average width of the ledge is 4½ feet and the ore averages \$13.50. The new mills being erected on the shores of Gastineaux channel are approaching completion. They will contain 520 stamps. Much work has been done this summer by the Indiana & Alaska M. Co. Eighty thousand pounds of machinery are being moved up the mountain. The main tunnel is in over 300 feet, and two other tunnels are making good headway. A full force will be employed all winter. Near Juneau are the Boston No. 1 and No. 2, on which a shaft has been sunk on the ledge and a crosscut 30 feet has been driven without finding the wall. The ore returns from \$5 to \$22 a ton. The estimated average value of the ore is \$7 per ton. On the Ready Bullion, one of the Treadwell group, a 120-stamp mill is being built. The mines at Sundum are progressing. The mill of the Bald Eagle continues to drop on the ore opened out early this season. The Sundum Chief mill of 10 stamps continues work. Both companies are under conservative management, and good results may be expected with the minimum of expense. The Treadwell properties are being increased to 520 stamps. The last report of the superintendent of this mine contains the statement that above the 220-foot level there are 4,477,500 tons of reserve ore available for the mill, and that in this measurement no account is taken of ore beyond the ends of the drifts. The further statement is made that between the 220-foot level and the 440-foot level there are 4,000,000 tons more.

On the shores of Gastineaux channel from the Ready Bullion mill to Juneau in a few months three miles of electric lights will illuminate the surroundings. The mills of the Ready Bullion, Alaska Mexican, Union, Treadwell new mill and the chlorination works, with numerous other buildings, will all be lighted by electricity.

ARIZONA.

(Special Correspondence).—On the 19th inst. the last official act throwing open the Deer Creek coal fields will be filed, approving the survey of the line segregating the ceded portion of the White Mountain Indian reservation, in the local land office at Tucson. This tract of country has long been known to contain large deposits of both copper and coal, the coal said to be of good coking quality. For many years persons have stealthily worked mines of coal and copper situated on this portion, until valuable mines had been located and opened. Mines of both copper and coal, situated in the same general vicinity, are held by persons who have subjected themselves to all the privations of doing their work by stealth, and by surfeiture of the officers having charge of the Indians, and who would now be glad to find purchasers from them of their holdings on terms that would remunerate

them, such properties being well situated in reference to transportation by railroad. There are now awaiting active men with energy and capital fairly developed copper mines accessible by railroad.

Solomonville, Nov. 1st, '98.

The group of copper mines near Fairbank station, being opened by M. Hardy, is producing ore that shows 60 per cent copper and some gold and silver.

At Globe the No. 1 water jacket furnace of the Old Dominion copper mine is reported turning out more copper with less losses in the slag than ever before, running out from 30,000 to 34,000 pounds of black copper 96 to 98 per cent fine every twenty-four hours. The company is employing over 300 men. The railroad terminus is now nine miles from Globe, at Cutter. The grading is near to Globe, and the railroad people are laying out switches toward the mines.

The shaft on the Mojave county Buckeye mine will be sunk another 50 feet. The Spenazuma M. Co. will erect a mill at their Graham county property. The mill is about ready for operation on the Belle McGilroy mine in Mojave county. Boston capitalists have been investigating the Black Rock properties in Graham county. The Arizona Copper Co. reports their output for August at 742 tons black copper. For the six months from March 1 to August 3 the total was 4446 long tons of black copper. At the Arizona Copper Co.'s property at Clifton the reduction plant has four smelting furnaces, three concentrators with a combined capacity of 759 tons per day, a leaching plant and converting plant. The mass of the ore treated is low grade, averaging not more than 6 per cent and a large amount running as low as 3 per cent. The company employs about 800 men and the product is near one and a half million pounds of copper per month. At Morenci the Detroit Copper Co. have in their reduction plant a new steel building for the smelters, where four large furnaces are in operation. A 400-ton concentrator has been commenced. A new hoisting works is being erected on the Yankee mine by which the ore from several adjoining claims will be hoisted. Copper-bearing ore has been found in the Copper King Co.'s mines at Solomon Springs. Larger ore bins are being built for the output.

Prescott Courier: A strike has been made in the Storm Cloud group of mines near Prescott of 6 feet of gold rock.

Tombstone Epitaph: The Tough Nut mining properties near Tombstone were sold last week under execution for \$8500.

Prescott Journal: G. C. Waddell & Co. are taking out good shipping ore from their gold claim near Prescott. W. C. Bashford is running the Chicago mill on ore from the Jersey Lily mine, and making a success in working the ore. F. Sattes & Co. are engaged in developing the Veteran mine near Prescott and they have good ore.

CALIFORNIA.

Amador.

Sutter Creek Record: The two hundred tons of ore from the Lincoln mine at Sutter Creek crushed in the Zeila mill at Jackson paid \$43 per ton, including sulphurets, amounting to \$8700. This ore was extracted while cleaning out the old shaft. This mine had been abandoned years ago. The company expects to erect a 40-stamp mill next spring. E. C. Voorheis is Supt.

Jackson Republican: Sinking continues at the Anita mine, near Jackson. The Amelia is making an upraise and is moving the work rapidly. The Kennedy mine is working its usual force and reducing the usual amount of profitable rock. The rock from the Median shaft at Amador City is being run through the South Spring Hill mill. Ten stamps are being used. The Argonaut maintains its record and last week the regular month's dividend was paid. The Emerson shaft is down 300 feet and in hard rock. There is a shortage of water; 80 of the 160 stamps of the two mills are dropping. The Zeila mill is crushing ore from the Lincoln mine at Sutter Creek. Sinking continues. Work on the Keystone mine at Amador City has resumed with a full force. The mill is running thirty stamps and will soon be able to run more. The new Wildman-Mahoney work involves a reservoir, a ditch 2000 feet in length and 4000 feet of pipe. W. F. Detert, owner of the Hoffman field, will probably begin development within the next year and sink two shafts simultaneously.

Butte.

Biggs Argus: Two new dredgers will soon be in operation and contracts are signed for building four more and another March 1st, '99. These dredgers cost from \$23,000 to \$30,000 each and the expense of running them reaches \$60 daily. Counting the original cost and the daily expense of running these eight dredgers for a year the promoters will have invested about \$390,000. The Argus is informed that Mr. Postlethwaite will superintend the building of five of these dredgers.

Calaveras.

A 4-foot vein of ore has been found in the Paragon mine, near West Point. The Gwin mine, near Mokelumne Hill, since Oct. 1st has forty stamps—hung up for a time on account of low water—all working. Pay ore is taken from the 1400, 1200 and 1000 levels. At the Thorpe mine at Fourth Crossing there is a large force employed grading for the gallows-frame, which will be 100 feet high.

The work preparatory to erecting a mill at the Ford mine is under way. Work in the mine has temporarily suspended. As the Lively mine mill receives its water from the Ford, the skips are kept running to the 700-foot level. When the mill is ready work will progress from the 100-foot level. The operation of the Marshall gravel mine is assured. Eastern people will continue. They are Fisher, Little & Coffman of Indiana. The Lively property will be lighted by electricity. Two shifts are working and the stamps are dropping. The big whistle at the Utica blew for

the first time since the shutdown last week, announcing the resumption of work.

San Andreas Citizen: Boston people have sent H. R. Ellis to investigate the Donnalán mine. His report was favorable and word has been received to sink a shaft. The work will be let by contract.

El Dorado.

Placerville Republican: The Marguerite mine near Diamond employs twenty men and is putting in a hoist and other machinery. At the Alabama mine near Mt. Au Kum the directors concluded to run the tunnel 150 feet farther. The electric power house near Diamond is nearing completion; the mines will then be run by electricity and the town will have electric lights.

Inyo.

Bishop Register: The Inyo Con. M. Co. which owns fifteen claims in Mountain Springs canyon, in the Argus range, are putting in a 3-stamp mill. The company has been prospecting the mines for a year, and a good showing of ore has been made. Fairfield, Sinclair and others composing the Geodetic and Coast Survey party which has spent several summers in these regions have arrived at Bishop and begun the writer's work. There are ten in the party. They work from the Pahump country to the Needles.

Kern.

Work on the Hard Cash mine near Garlock has resumed. The owners contemplate putting up a dry concentrating plant. The gold mine discovered last year in Tollgate canyon, Amalie district, by J. R. Smith and sons, is proving profitable. In a recent cleanup of three tons of rock, which required ten days' work by Smith and his two sons, \$412.84 was yielded. The ledge from which this ore was taken measures 2 feet in width.

A find has been made near Garlock in the Little Mesquite canyon of a ledge 10 inches wide of fair value.

Randsburg Miner: The Wedge mine is taking out rich ore at the 350-foot level. They have a vein of about 1 foot of this ore. The G. B. mine near the Stringer district has been sold to the owners of the Red Dog mill at Johannesburg for \$10,000. Much work has been done on it. The new owners will at once take out ore. The ore body is large but not high grade, though enough, however, to make it valuable property. The Kinyons have struck a good body of ore in their mine at a depth of 150 feet. The vein is nearly 3 feet thick. The Yellow Aster M. Co. will have their 30-stamp mill in operation about the 15th of Jan. It will have a capacity of 150 tons per day. It will be lighted by electricity and run by steam generated by an oil-burning engine. They have water enough, it is thought, to supply their mill, but their wells have not yet been thoroughly tested. W. T. Garrison at Havilah is getting out ore that will average \$40 per ton. The miners in Pleasant canyon, in the Panamint range, are taking out considerable ore and have it crushed in the Anthony mill. At the Ratcliffe mine in Tuba canyon sixteen miners are at work. The ore is hauled to the mill at Postoffice.

Mariposa.

Captain Ward, the mining expert and promoter of mining interests generally, tells the *Gazette* that the Mary Harrison mine at Coulterville has proven to be a dividend payer and a mine that has come to stay. On the 700-foot level a 10-foot vein of paying ore has been struck that will mill at least \$10 a ton. The Captain has made a particular study of the mother lode and says it is amusing to see Eastern experts prospect this main mammoth ledge. The main ledge that crops out so prominently, he says, rarely has any gold in it; as a rule the pay rock is found in the hanging, occasionally in the foot wall, but seldom in the main ledge; only in a few instances has gold been found in the main ledge.

Modoc.

The mineral discoveries made a few months ago near Lake City have been submitted to assayers and the result has interested local and outside people. Brown & Robinson of Redding have been examining the prospects and concluded to erect a stamp mill immediately. The assays are said to have yielded \$27 a ton gold and some silver.

Mono.

The Dunderberg mine at Bodie, with the mill and cyanide plant, was sold last Monday by the sheriff to J. Brown, in behalf of the creditors, for \$17,000.

Nevada.

(Special Correspondence).—At the Con. St. Gothard mine, near Columbia Hill, work is progressing on the new mill, and the ore output continues in the meantime, with a good storage stock ahead. The property from which the ore is produced absorbed the old Delhi mine, through whose tunnels most of the work is conducted. The location of the property is advantageous for cheap working, and the tunnels cut the ledges at considerable depth. The ore thus far found is low grade, and the company is proceeding upon business-like methods in placing improvements for treatment of the product.

North Columbia, Nov. 1st, '98. The Grass Valley Union is informed that the lead has been found in the Holbrook mine at Randolph Flat, and that the gravel is good.

Transcript: The South Yuba Co. has notified the following mines at Grass Valley that it cannot furnish them with water for hoisting or drilling purposes, but will keep their pumps going: Brunswick, Maryland, Massachusetts Hill, Empire, Central, North Star, Omaha and Allison Ranch. There must be four or five days' rain before the company can give them a full supply again. In the meantime 600 of the 800 men at Grass Valley will be thrown out of employment and the daily payroll at the mines be reduced from \$2500 to about \$500.

Union: In the New Eureka mine, Canada Hill, some high-grade ore has been found at

different times, but last week a ledge 1 foot wide was struck that yields \$20 a ton.

Transcript: The South Yuba Co. notified the Providence mine at Nevada City that until there is a good storm they can have only enough water to keep the pumps going. This will result in eighty employees of the Providence being temporarily laid off. The Champion mine can it is thought be kept going with water from the Excelsior ditch.

Riverside.

Los Angeles Review: Near Perris, cyanide plants have been established both at the Good Hope and the Santa Rosa mines to work the tailings of these mines. J. N. Boicourt has a force of men on his claim near the Good Hope. He has a ledge 30 feet wide, which by the cyanide process gives \$80 a ton. He will soon build a plant of his own. Some work has been done lately on the Red Jacket mine, adjoining the Good Hope, and belonging to that company. The ledge is 3 feet wide, and assays well in gold and silver. At the Good Hope things are quiet at present. The Gavalon mine is working forty men, and the 10-stamp mill is running continually. S. H. Robb has been operating for several years a dry washer in the gulches about the Good Hope and making it a success. The Santa Rosa cyanide plant shipped a bar of bullion weighing \$500. The plant is said to net its owners \$1800 per month.

San Bernardino.

The St. George mine, near Manvel, having been abandoned by previous owners and chloriders, is said to be paying well. A strike was made at the 200-foot level of 10 feet of ore. The whole ledge averages \$35 per ton. The mine has lately been bought by A. G. Campbell of Salt Lake City. The cyanide plant on the Desert Queen mine is running successfully.

Redlands Facts says that considerable prospecting has been done in that neighborhood, and ore has been found that assays from \$6 a ton upwards, but is of a refractory nature. It is locally reported that arrangements have been perfected to build a chloride plant at Redlands.

Downey Champion: The Peacock M. Co. is shipping ore from the mines near Lavic. Considerable development work is being done in the neighborhood of Lavic.

San Diego.

In Pilot Knob district, near El Rio, development work has been done on the Carmen and Muy Bien mines. On the Carmen a 100-foot shaft has been sunk, and the first 50 feet displays a ledge 3 feet in width running \$25 per ton. The Muy Bien has two shafts, 84 and 32 feet, and the ledge averages 9 feet. The ore ranges from \$7 to \$72.

San Diego Union: Workmen at Cuyamaca are building a tank-house 160x80 feet for a cyanide plant for the treatment of 200,000 tons of tailings from the old Stonewall mill. The tailings have been bought by Strauss and Shinn of Los Angeles and San Francisco. Experiments said to have been made by the cyanide process show the tailings to be worth from \$2.50 to \$7 in gold per ton. Receiver Pauly of the Golden Cross mines, in his eleventh report, for September, shows that the clean-up amounted to \$42,146.68 and there was received from other sources \$989.10. The expenditures amounted to \$43,407.55, which included \$23,000 paid to the defendants in the action. The payroll for September amounted to \$7500 and the fuel bill to \$1300. There remained \$70,363.66. The receiver reports that the properties show an increase in ore deposits and a vein of ore has been struck in the Queen mine, which, it is thought, will prove profitable. Within a few months, the receiver states, the debts referred to in the stipulation will be paid. The Pacific bank of San Francisco, which owned a half interest in the Helvetia mine at Julian, has sold its share to C. H. Dunsmore for \$10,000, who transferred the property to E. W. Sebben for \$6000. Mr. Sebben is one of three Denver capitalists who have entered into a contract with the mine owners to give it a six months' trial; and should it prove satisfactory, they will buy it. The other half interest is owned by nineteen parties, represented in San Diego by Holcomb & Utley.

Shasta.

The Mt. Shasta mine has put in a 10-H. P. gasoline engine. Thirty men are at work. Daily fifteen tons are shipped by teams to the smelter at Keswick.

Redding Free Press: Fox & Queen have been operating in the Philadelphia mine, near French Gulch, in an old tunnel, and found a ledge of ore of sufficiently high grade to ship to the smelter at the tide water. J. Blagrove, at French Gulch, is interested in two leases on the Washington mine. He has been successful and is shipping ore to the Selby smelter.

Sierra.

The Haskell Peak G. M. Co. at Haskell Peak is preparing for an early spring start at the mine.

Siskiyou.

B. F. Thornton, acting for New York capitalists, has bought the Jones & Daniels quartz mines in Quartz Valley. The purchasers will open up the mines on an extensive scale. J. O. Rusby, Supt. Oro Fino mines, near Fort Jones, has been rushing work to be ready for the rains. F. D. Fraser has men doing development work on the Golden Eagle quartz mine on Indian creek. He reports his prospects looking well. The Sheba G. M. Co. on Patterson creek, who lately bought the Fry & McCauley mine for \$35,000, are crowding work. The company will put up a 10-stamp mill at once.

Yreka Journal: Brokaw & McClaime bought the mining property of the R. H. Campbell G. M. Co. in Quartz Valley, comprising 2500 acres of placer mining ground and ditches and water rights connected with this property for \$50,000. They will work the mine on a large scale.

Yreka Reporter: The Gold Bar Co. near

Sawyer's Bar are making improvements. This winter the 20-stamp mill will be kept running. —H. Finley's arrastra is grinding good rock at his mine near Sawyer's Bar. As soon as the water season opens he will put on more men and open the mine on a large scale. —A tunnel is being run to crosscut the vein at the White Swan mine on Tanner's Peak. —A good ledge has been found in the Live Yankee mine in the Salmon district. —Good ore comes out of the Great Eastern mine, Sawyer's Bar. —T. J. Dunn has sold his Indian Bar placer mine in the Salmon country to the Golden Jubilee M. & M. Co. for \$1600.

TOULUMNE.

It is reliably stated that work on the Lost Fox mine near Sonora will soon be resumed. The Fox has a double-compartment shaft 65 feet on the vein, which is 7 feet wide, of fair quality, with a streak of high grade. It carries some free gold, but most of the values are in the sulphurets. A steam hoist will be put on immediately. —In the Turner Flat gravel mine the pay gravel varies from 2 to 12 feet thick, but the width of the streak has not yet been ascertained. Bed rock was struck at 73 feet. The daily output is about 180 buckets of 800 pounds each.

Sonora Independent: At the Atlas mine on Jackson Hill eighteen men are employed in driving a tunnel, 2000 feet in length. The property was sold recently to a Scotch company. —Mgr. Doyle of the Alameda G. M. Co. has struck water at the 900 level, and the shaft and lower drifts have been allowed to fill; at the 600 it is lifted and passed to a reservoir, where a 4-inch double-action pump returns it to the tanks which supply the batteries, boilers and hoist. The return water from the mill passes into the same reservoir and is filtered and repumped. It enables the mill to work during the dry season. —At the Bawn mine the shaft is down 300 feet. —P. Mullins is developing a vein on the east portion of the mother lode. —W. Long will open the old Patterson mine and put in from 60 to 100 stamps. It is a low grade property, but by milling in large quantities it is thought the mine can be made to pay. —On the Republican mine, near Jacksonville, three eight-hour shifts are working the ledge from a 180-foot shaft. —The Rawhide is down 1550 feet. The ore body looks well. Work at the 1500-foot level is stopped until the electric power plant is completed. Supt. Turner is doing general repairs. —The Arborea has a shaft 300 feet on 3 feet of quartz. —Cross-cutting at the Rappahannock is in progress at the 400 level.

Jamestown Magnet: At the Bonanza mill, Sonora, the two stamps are crushing sixteen tons of ore daily, steam power being used. —The Maryatt-Gagnere mine began last week a three-compartment shaft to be sunk upon the Gagnere claim 1000 feet. —At the Alexander Stewart pocket mine near Sonora Wainwright & Co. took out \$2000 last week. In the past year they are reported to have taken out \$15,000. —Widening the shaft at the Star mine to a double compartment is completed to a depth of 200 feet. —Three eight-hour shifts are employed at the Over mine, Saw Mill Flat. Work on the shaft, down 250 feet, is in progress. They hoist pay ore daily. —The Valparaiso mine near Tuletiown has been bonded to F. Miner of Chicago. —At Stent the Jumper mill started up and is dropping twenty stamps. —The New Era shaft at the Jumper has been completed to a depth of 700 feet. —In the Dutch mine at Quartz the shaft is below the ninth level. The chutes and ore bins are full of ore. —In the Santa Ysabel mine in No. 1 shaft on the 400 level they have cut into a vein of high-grade ore. —The Jumper Co. uses its water supply by pumping back the water after it passes through the mill and reusing it again and again. By this means it is hoped to keep the mill running steadily. —The water right owned by the Big Oak Flat Ditch Co. near Groveland was bought by J. Rosenfeldt for the Shavmut-Eagle Co., who will construct an electric power plant to operate its mines and mill.

Sonora Democrat: At the Buchanan work is confined to sinking the new shaft, which is down over 350 feet. It is proposed to keep sinking until a drift can be run 100 feet under the deepest of the old workings; if the vein meets expectations the old workings will be unwatered and a big force put to work.

Sonora Banner: A large vein has been discovered at the Santa Ysabel, which is said to be good grade. —A shaft 1000 feet deep is to be sunk at the Maryatt-Gagnere, near Tuttle-town. —Power drills have been put in the Hazel Dell mine, near Soulsbyville and work on the tunnel has begun. —Forty M. feet of lumber has been engaged for the Buchanan mine to reconstruct the old mill.

Yuba.

Developments at the Golden Trout mine near Strawberry valley show encouraging results. The company expect to install an electric plant for lighting purposes and eventually for motive power. J. R. Watson, Jr., is president of the company.

COLORADO.

BOULDER COUNTY.

Ward Miner: The B. & M. mine near Ward in the past thirty days shipped 302 tons of ore to the Culbertson mill and 41 tons to the smelter. —R. Smith and associates have leased the Milwaukee mine at Sunnyside for two years and have begun work. The Milwaukee shaft is 325 feet deep and five levels have 800 feet of drifting. The leasers give a royalty of 30 per cent.

CHAFFEE COUNTY.

Near Whitehorn the Lillie mine is producing ore that yields \$95 gold a ton. —On the Urania group the ore runs \$50 a ton.

CLARK COUNTY.

Idaho Springs Gazette: The Foxhall tunnel near Idaho Springs is in 1400 feet. It cuts the belt of vein in which lie the old Seaton mine and several producers of gold and silver

ore. The workings are reported to be in fine ore. —The Chesapeake crosscut tunnel is in over 900 feet. The lodes cut are the Salamander, the Enterprise and the Curlew. The tunnel cuts this vein at a depth of 400 feet and shows 5 feet of quartz of good value. One streak of this runs from ten to twenty ounces in gold.

CUSTER COUNTY.

At Silver Cliff the Jay Gould has opened, with a diamond drill, 200 feet of mill ore. A new mill is to be built soon. —A New York company is developing the Song Bird and Gray Eagle properties and will build a mill.

DOLORES COUNTY.

Rico Star: Hall & Co., on the Newman lease near Rico, have 200 sacks sorted for shipment. —H. Herr made a 30-ton shipment of ore from his lease on the Yellow Jacket to Durango. —The carload ore shipments for the second and third weeks in October were twenty-two carloads. The shipments as compared with last year are: Jan. 1 to Oct. 21, 1898, 618; Jan. 1 to Oct. 21, 1897, inclusive, 372; gain over last year, 246 carloads.

EAGLE COUNTY.

Red Cliff Blade: The Black Iron mine is making extensive shipments of ore. —Shipments from the Battle Mountain district were six carloads last week, making 333 cars for 1898.

EL PASO COUNTY.

The output of ore in Cripple Creek district in October is valued at \$1,488,130—the highest for any month in the history of the camp. —It is locally reported that within the next thirty days work will be resumed on the Jewel property on Womack hill by the Cripple Lawrence Investment Co. of Denver, who hold a lease for \$75,000 on the claim.

The Moon Anchor, Cripple Creek, last week produced 300 tons of ore, of which 240 tons went direct to the smelters and 60 to the mills. —Shipments from the Specimen last week by four lessees were 53½ tons, with a bullion value of \$3068 60. —The F. O. Wood lease on the Garfield Con. is producing 130 tons a month, four ounces to the ton.

The production of the Independence, near Victor, is about 1200 tons per month. Half of this ore is high smelting grade, while the remainder is mill ore that will average about \$30 to the ton. —The Elkton Con. M. Co. at Victor this week purchased the Apple Ellen, a fractional claim of three acres, for \$25,000—\$5000 cash and \$20,000 in sixty days.

Denver Mining Record: A lawsuit involving the title to the Pike's Peak placer will be heard in Denver Nov. 12th. The property in question, situated on the south slope of Mineral hill, has been patented for more than two years, yet the contention of the plaintiffs, McKelvey et al., if allowed, would invalidate the principal placer claims in the Cripple Creek district, if not in the entire State of Colorado. The ground of the proceeding is that the Black Jack, a lode claim, was located before the issuance of the patent to the placer. Several other locations were also attempted, but not consummated, and fissure veins were known to exist in this placer territory. The fight over the Hull City placer involved practically the same contention and was decided adversely to lode claimants.

Victor Record: Last week a new strike was made on the seventh level of the Vindicator at Victor, and this week another equally important find has been made in the Anna J. shaft. The vein is from 12 to 14 feet in width, returning values of \$30 to the ton, while the screenings show an average of \$50 to the ton. —Work has been resumed on the Santa Rita. The shaft is to be put down 500 feet below present depth. —Three tunnels are being driven into the mountain, of which number two, the Columbine-Victor, already in 1500 feet, and the Squaw Mountain tunnel are using air drills.

Returns from two shipments from the Porcupine, the first, one ton of carefully sorted ore from the Sill and Osborne lease, gave \$1197 to the ton, and the other, of 1704 pounds from the Tanney sublease, yielded \$94.60 a ton. —The Portland G. M. Co.'s output is maintained at 100 tons daily. —Returns from a shipment from the Silver Tip gave \$578 to the ton. —The daily production from the Creston lease on the Jack Pot is from 25 to 30 tons of the average value of two and one-half ounces. —The new machinery for the Lucky Guss is nearly all on the ground. —W. S. Stratton's Independence is producing forty tons daily. —Keith & Grube have resumed sinking on their Vindicator lease and will put the shaft down another lift from the 110-foot level. The output is about two carloads a day. —The Baltimore Leasing Co., operating on the Vindicator end of the Christmas, marketed seventy-five tons of two-ounce ore and twenty-five tons of mill dust.

GILPIN COUNTY.

Central City Call: The Lillian mine on Pewabic mountain, worked by D. McKay & Co. under a lease, are receiving returns of \$220 per ton for first-class and \$65 for second-class ore, and with their small plant they clean up about eight tons of smelting ore a week, running about half and half. The coarse screenings are saved. —At the property of the Penna Central G. M. Co. sinking is progressing with three eight-hour shifts. A depth of 550 feet has been reached. There is a smelting streak from 6 to 8 inches wide and in between there is about 4 feet of a milling ore. —At the Meeker-Pittsburg shipments of smelting ore are being made, the first-class running \$90 while the second-class runs \$35 per ton. The shaft is down 325 feet. Besides the smelting ore the mine is producing from eight to ten cords of mill ore every month.

Central City Observer: The Ross G. M. Co. have lowered their station pump to the 500 level of the Central City mine. They are re-tilting and getting in shape for a steady ore production throughout the winter.

LAKE COUNTY.

The Mahala M. Co. are hoisting seventy

tons daily from the 250-foot inside shaft on the 900-foot level. —The Mab M. Co. made an output of 3300 tons of lead sulphides in October. This tonnage, with the amount of waste from the drifts, is all that the 1000-foot shaft can handle. It requires about four minutes to make the round trip. The average value of the ore is \$20 net from the smelter.

Leadville News-Reporter: Brown & McAllister, owners of the Gordon, near Dayton, have given an option on that property for \$250,000. The Gordon has lain idle owing to a disagreement among the owners. There is a vast amount of milling ore, that will range in value from \$16 to \$20, that can be profitably handled by amalgamation. —The Fanny Rawlings mine, Leadville, continues to increase the payroll and tonnage daily. The shipments are close to sixty tons daily of carbonates of copper oxide and copper-iron sulphides. —The Snow and Karus property, in Adelaide park, is to be again tested by a diamond drill. Some time since the drill was put down 100 feet, but the hole made such a rush of water that the operators became discouraged, but they have reconsidered their decision. —Nine sets of lessees are working on the Lillian G. M. Co. property. More ore is being shipped than for a year past. —Mgr. S. S. Robinson is getting in readiness at the Iron Silver for a big production. The levels are being unwatered and the stopes and drifts put in shape. The bodies of sulphides are large—some are known to be 100 feet thick of good pay ore. The unwatering of these immense workings and resumption of shipments is as important as any mining undertaking in the Leadville district to date. The two cages on the Moyer can easily hoist an output of from 150 to 200 tons daily when the mine is in shape.

MINERAL COUNTY.

The Ridge mine, at Creede, for the first time in its history is producing gold ore. —The following are producing mines in Creede district: New York, Last Chance, Amethyst, United, Park Regent, Commodore, Batchelor, Ridge, Solomon, Ethel and Mollie S.

SAN JUAN COUNTY.

The Silver Ledge mine at Chattanooga is producing fifty tons of ore a day of an average value of \$9 a ton. This through a 10-stamp mill produces ten tons daily of concentrates. A body of silver-lead, showing some zinc, is in the workings.

The shipment of the Ridgway mine at Silverton aggregates three carloads weekly. The ore yields \$1200 a carload.

SAN MIGUEL COUNTY.

From Ophir fifteen carloads of ore were shipped last week. The amount shipped since Jan. 1 is 565 carloads.

The Shoemaker continues its daily shipment of ten tons that will plate \$20 per ton.

The Carribeau has been shipping six cars of concentrates and crude ore per week. The mill is kept busy day and night and a high grade of concentrates is turned out.

In the Silver Pick mine in the Telluride district 150 men are employed. The mill is running on low grade ore.

Telluride Examiner: Test runs from the Keystone Placer give an average of 50 cents to the square yard. —From a mill run of ore from the Sweetheart mine six ounces in gold, thirty ounces silver and a percentage of lead were received.

SUMMIT COUNTY.

Breckenridge Journal: The Germania, near Breckenridge, made a 22,195 pound shipment which brought the leasers something over \$700 net. The ore ran 189 ounces silver and 4¼ per cent lead.

IDAHO.

The Standard mine near Wallace employs 150 men and the daily ore shipments average 300 tons. It is developed to a depth of 1100 feet. The company has recently ordered new hoisting machinery at a cost of \$40,000.

The American D. M. Co., at Gibbonsville, are said to have reduced in the three months prior to February, 1898, in their 30-stamp mill and chlorination works, 100,000 tons of ore from their own group of mines, yielding an average of \$12 per ton in gold. Owing to an accident to their mill within a year, which resulted in the foundation under two of the batteries settling and throwing the machinery out of line, and the collapsing of a high trestle over which the ore was conveyed from the mine to the mill, in which a number of people were badly crippled, resulting in numerous law suits for damages, the company was forced to suspend operations, throwing 150 men out of employment. These suits have recently been settled, and it is locally reported that the property is likely to be operating at its full capacity soon. They have kept a small force on development work with machine drills all summer in the lower levels of the mine, which is opened to a depth of 1000 feet. —The Anderson group, owned by local people, worked by leasers, has produced nearly \$200,000 worth of gold bullion, ground out in old-fashioned arrastras. The ores usually work from \$20 to \$50 per ton in the arrastra.

The Montana & Idaho Co. own a group of claims which is extensively developed. The company employs twenty men. Their veins run from 6 inches to 4 feet thick and are worth \$15 to \$50 per ton. They contemplate the erection of a plant on the ground.

The foundation for the new pump on the 1600 level of the Helena-Frisco, at Gem, is completed and getting the machinery in place has begun. The pump weighs 200,000 pounds. It had to all be made in sections or cut after casting, so that no piece would be too large for the shaft.

Boise Statesman: Near Halley, the Big G M. Co. of Chicago has ten men employed. The company intends to put in a 40-ton concentrator. S. Gundaker is Supt. Four carloads of ore have been shipped from the property. The vein is 9 feet wide and the ore averages \$35 a ton in gold, fifty-five ounces of silver and 22 per cent lead. —The 10-stamp mill on the

Daisy property at Pine Grove is running on good ore.

Idaho City World: The Morning Star Co. at Grimes Pass contemplates putting up a 100-stamp mill next year. This company owns twenty-eight quartz claims. —On the Bulldog group of claims in Sea Foam mining district, Custer county, C. Crane of Salt Lake City, Utah, has opened a property that runs well in silver and in gold. He has 1400 sacks of ore that will average 100 ounces silver and \$20 in gold. He will arrange for putting up a plant next season that will enable him to handle the ore on the ground. Work will be resumed early in the spring. —Work has resumed in the Mountain Queen mine at Grimes Pass. This claim is owned by a Boston company, who put up a 20-stamp mill several years ago and worked the mine three seasons. The ore was low-grade, but paid a small profit above mining and milling expenses. When dead work was required for greater depth the company suspended operations.

MONTANA.

The Garnet Co., of Pony, shipped a lot of amalgam last week; they have had a successful run this season. The mill has handled an average of forty tons a day.

As a result of the compromise of the suit as to surface and underground rights between the Revenue Co. and the Monitor G. M. Co. at Butte, the Revenue was granted the low grade ores on the dump of the Monitor, aggregating 1000 tons of an average value of \$12, and the privilege of extracting from the Monitor mine such low grade ores as were left when the high grade shipping ore was taken out.

Since Jan. 1, '95, the Montana O. P. Co. has paid \$800,000 in dividends.

The shaft in the Carbonado, Montana, coal mine is 900 feet deep. The vein is from 5 to 11 feet thick and is said to cover 6000 acres.

Clancy Miner: Continual bad weather has made it impossible to haul ore from the Mockingbird mine. New ore bins are being constructed at the mine, and in the meantime twenty men are building a gravity tramway from the mine, which will run two four-ton cars, will be about 1600 feet in length, and cost about \$3000. At the receiving end below the Mockingbird a 200-ton ore bin will be constructed. It is expected to have the work in operation in three weeks. At the mine the shaft has reached 200 feet and will be driven another 50 feet before drifting begins. There are 2 feet of ore at the 200. The tramway will be trestle-work almost its entire distance and will reduce the cost of transportation to the railway \$1 per ton and will pay for itself in less than a year. It is expected that when it is finished the output of the mine will be 500 tons of ore per month.

Butte Inter-Mountain: Work has been discontinued at the new Parrott smelter at Parrott, and in all probability it will not be operated for a long time. The smelter cost \$750,000 and will probably cost \$350,000 more to complete. The plant, it is believed, will not be completed until the development work at the company's mines in Butte is far enough advanced to justify a sufficient supply of ore to keep the smelter in operation. —W. A. Clark has secured about 220,000 shares of stock of the Ruby and a cash payment of \$20,000 has been made to bind the agreement. Mr. Clark now holds a controlling interest in the property. —The water is out of the Hope mine at Basin to the 400-foot level and sinking begun.

Whitehall Zephyr: Work on the Twin Bridges smelter was begun last week. It is stated that the enterprise will not be dependent upon custom ores, but upon the mines of the company. It is thought that the work of rebuilding and fitting the plant will be accomplished within 60 days.

Mission: Last month there were seven carloads of concentrates shipped from mines of the Vermilion M. Co. to the smelter, from which good returns are reported. This month double that number of cars will be shipped.

NEVADA.

The Magnolia mine of De La Mar last Monday placed another lot of high grade gold ore at the sampler in Salt Lake City. Although the haul from the mine to the smelter is long and expensive, the ore yields a good profit. The owners, of whom T. R. Jones of Salt Lake City is one, will very likely undertake the building of a mill early next spring.

Reno Gazette: At Escarora the Dexter mine is equipped with steam hoisting works and a 40-stamp mill, besides a cyanide mill. The power is electrical, transmitted twelve miles, and has a capacity of 80 H. P. The company will soon have new electrical plants which will give them 300 H. P. An ore body 1200 feet long and 150 feet in width has been uncovered which is estimated to net \$4. The deepest workings are 150 feet. The ore is hoisted in ore cars and run to the mill. About 65 per cent of the metal is saved by plate amalgamation. The tailings are then run to large ponds near the cyanide mill. The company will double its capacity the coming year.

The Slip mine in Olinghouse district finished a cleanup of eleven tons of ore, out of which they secured \$1500 in gold. —The Elra shipped from Tuscarora bullion and concentrates to the amount of \$1500, the result of the first eight days' run of the Navajo mill.

The Glasgow & Western M. Co. last Saturday placed a carload of ore from its mine at Cherry Creek in Salt Lake City, the value of which is estimated at \$20,000. According to the assays, the silver contents alone amount to over 1500 ounces per ton, while with this is 26 per cent lead and 6 per cent copper. This is the third consignment of ore for last week.

Virginia Chronicle: Work on the Suro tunnel level of the Brunswick and shaft No. 1 was suspended last Monday and will probably not be resumed until after the drainage of the Comstock begins. The directors of the Justice M. Co. have authorized the purchase of the Washoe mill. It will enable the com-

pany to reduce at a profit a lower grade of ore than that lately taken out.

Winnemucca Silver State: A 1-foot vein of chloride ore, carrying 300 ounces in silver to the ton, was found last week in the Pennsylvania location in Trinity district, near Winnemucca.

NEW MEXICO.

At Mogollon in the Confidence mine 130 men are employed. The poles for electrical appliances at the mine are being placed and the machinery will soon be operated and the mine lighted by electricity.

The Pinos Altos G. M. & M. Co. have started their mill on a test run of ore from their properties near Pinos Altos. M. Stanley, who owns properties in the Pinos Altos district, has completed a test run, and it is said it yielded more than expected. The Good Hope mine at Bland has begun work, after a lengthy shut-down. Good ore is said to be taken out of the Washington mine at Cochiti. The Alice and Carrie mine, near Pinos Altos, has struck ore assaying 36 per cent lead, \$4.20 silver and \$9.50 gold. The Cochiti G. M. Co. shipped an 82-pound brick of gold, the product of the week's run. This output will be doubled when the addition to the big mill is completed. It will contain six leaching tanks 20 feet in diameter. The Timber Peak M. Co. of Socorro county has secured claims in the Magdalena mountains, and built a wagon road from Water mountain to their mines. It is claimed that one body of ore measuring 20 feet across will yield \$12 to the ton, and another large vein will not give less than \$6.50 a ton.

A concentrating mill is being built to handle 150 tons of ore daily, and cottages for the workmen are being built. The anthracite coal pits at Cerrillos have started up for the winter, and there are 500 men on the payroll. The output is 1000 tons of coal per day, the bulk going into old Mexico. Several strata have been discovered in the Common Sense mine at Santa Rita. The American mine's shaft is being drained preparatory to the resumption of operations. A. Preisser has made a lead-carbonate strike in the Iron Blossom mine that assays 74 per cent lead and \$8 in gold and silver. The September output of dry washer gold, bought by Keller, Miller & Co. and Robbins & Crew, was \$1200.

Wheeler & Co. are shipping 30 tons of first-class ore from the K K mine to the El Paso smelter. The Andrews mill is treating 150 tons of Trippie mine ore. Santa Fe New Mexican: The Old Reliable M. Co. at Golden is working a good force and meeting with good results. A mill run went \$12.38 per ton in gold; the veins are large. The Monte Cristo Co. is working the big dredger with success.

Silver City Independent: The Atlantic people have started their mill on a test run on ore from the company's properties, which have proven better than expected. It is thought the mill will soon be in constant operation. The Mountain Key mine, Pinos Altos mining district, owned by Chandler, Collier & Co., has decided to start up their mill to make a test run on ore taken from Mountain Key.

OREGON.

In the John Day country the Urie Dredge Co. has its machinery on the ground and will soon have everything in running order. The company is prospecting all the time and the results have been satisfactory.

Sumpter News: The Badger mine, near Sumpter, employs forty miners. The 10-stamp mill recently built is running day and night.

Baker City Democrat: The reduction plant of the Golconda M. Co. will be in operation by December.

Ashland Tidings: A half interest in the Tunnel Six mine, Glendale, was sold for \$30,000 cash. The company will run a tunnel 120 feet in the clear and over 1000 feet in length with double track. A 20-stamp mill is in process of erection and chlorinating works will be built. Lighting and power by electricity are to be installed.

Jacksonville Times: The cyanide plant being put up at the Eureka Mining Co.'s plant on Soldier creek, Josephine county, will be in operation soon. T. Gilmore of Kerbyville, who owns a placer mine in Indian Creek district, brought several hundred dollars in nuggets to Grant's Pass last week.

Ashland Record: The Rogue River Dredging Co. intends to put in a number of dredges, and this fall there will be one put in perhaps at the mouth of the Applegate river. This company has control of 120 claims which cover all of the river supposed to be fit for operation. The bridge and flume across the Big Applegate recently completed by the Swain M. & M. Co. fell to the bottom of the stream last week. The company paid \$10,000 for the mine and has expended \$7000 for improvements. The bridge was built to support a flume of 2200 inches capacity. The mine has been in operation only a week. The wreck is supposed to have been caused by dynamite.

Baker City Democrat: Near Granite the Red Boy mine is dropping twenty stamps ninety-five times a minute and crushing sixty tons of ore a day. Worsham & Clark at Malheur City struck a 6-inch vein from which in one day they took out \$75 in gold, besides rick ore. They will erect a 2-stamp mill.

Ashland Tidings: The Golden Key Mining Co. has twenty-five men at work upon the Braden mine in the Gold Hill district. This company has also bonded several properties in the Kane's Creek district. Twenty-two

hundred feet of 22-inch pipe has been added to the hydraulic plant of the Lance Mining Co. operating on Foothills creek; they will work day and night all the season. B. N. White of Spokane is negotiating for an interest in the Free Silver mine in the Sampson Creek district near Ashland. The property has made a good showing as far as prospected. The Oregon and California M. & M. Co.'s property near Pogeama has been bonded to Tryer & Kile, from Colorado, who began operations Oct. 1.

Baker City Republican: G. Barrett of the May Queen near Bourne contemplates building a 50-stamp mill on his mine.

UTAH.

Tintic District: (Special Correspondence).—The old and well-known mines of the Tintic district, which are prompt dividend payers, are keeping up the steady pace as regards tonnage production that has so long characterized them. The Bullion-Beck is shipping fifty tons per day of crude ore, which runs 15 per cent lead, 40 ounces silver and small values in gold. It ships 300 tons per month of ore that runs 10 per cent copper, 30 ounces silver and \$5 per ton gold. It is storing the milling ore, having 10,000 tons on hand.

The Eureka Hill, which mills about 100 tons per day by its combination process, also ships a large tonnage in the crude. Its mill ore averages 18 to 20 ounces silver, \$3 gold and 4 per cent lead. Its smelting ore runs high in lead and from 50 to 100 ounces in silver to the ton.

The Centennial-Eureka shipments run from 100 to 200 ounces silver and \$18 to \$20 in gold to the ton.

A year ago the Grand Central was a new property and was beginning to attract attention. To-day it is the largest and one of the richest shippers in the district. Its ore runs from 60 to 100 ounces silver and from \$12 to \$20 in gold to the ton. It is practically all rich enough to ship to the smelters.

The Mammoth, which mills its large tonnage of ore, saves large values on the plates and ships about two cars per week of concentrates.

The Star mine, now under the active management of Messrs. Hubbard and Lawrence, seems destined to become the next property in Tintic district to enter the list of heavy producers. It is located between the Dragon iron mine on the one hand and the Ajax and Mammoth on the other. It is thoroughly exploited by shafts, tunnels, winzes, stopes and drifts, which reveal remarkably extensive bodies of milling and smelting ore. In all the great network of drifts and winzes which I followed, there was practically no dead work. The ores appear to be similar to those of the Mammoth and Grand Central, in a formation between porphyry and white lime. The management is making various tests with the view of erecting a mill for treating the ore. Some of it appears adapted to cyanide work.

In the month of September 400 tons were shipped. Two cars of dry ore returned 72½ ounces silver, \$27 gold and 9 per cent lead to the ton. Another 100-ton shipment resulted 42 per cent lead, 18 ounces silver and \$3.80 gold. In the average of ore shipped it is asserted that over half the values were gold. The property comprises fourteen claims and is being well equipped with machinery and buildings. Supt. Lawrence claims there are 100,000 tons of mill ore in sight, which will average \$15 per ton. The ores are mainly silicious. In some parts of the mine, however, there are rich carbonates of lead.

The principal mines comprising Tintic district encircle a spur of the Tintic range in a peculiar manner.

The Sioux-Ajax tunnel has been driven 4200 feet without, it is claimed, encountering any large ore bodies, though barren fissures were crossed. Several well-known producing mines, notably the Swansea, South Swansea and Treasure Hill, are situated outside of this apparent circular zone. The deepest workings in the district are in the Mammoth, which have reached 1700 feet. All the properties in the circle described are dry mines, while in the Treasure Hill, a mile south of the Iron mine, there is a profusion of water in the shaft and drifts.

Eureka, Utah, Oct. 22nd, '98.

(Special Correspondence).—A recent estimate of the tonnage production of the Mercur district is as follows:

| Mine. | Tons per day. |
|----------------|---------------|
| Mercur | 300 |
| Golden Gate | 600 |
| Sacramento | 100 |
| Geyser-Marion | 150 |
| Daisy | 100 |
| Chloride Point | 100 |
| Total | 1,350 |

Mercur, Oct. 29th, '98.

Mgr. Dern says it had been decided to remodel the company's mill at Manning and replace the wooden with metallic tanks. The set will consist of ten tanks, each with a leaching capacity of 150 tons. The Overland mill at Sunshine will be started soon. Mgr. Peyton has built a plant with every device, by which the cost of milling is to be reduced.

Drifting in the Old Jordan and Galena, at Bingham, has begun under the old workings, which have been above the water level, although the output has reached several millions. Returns from ore in the Black Tunnel Co.'s mine at Tintic show sixty ounces silver and \$4.80 in gold. The White Swan mine, in Box Elder county, will continue work through the winter. They have 3 feet of ore,

averaging \$38.20 per ton. The Queen of Sheba, Deep Creek country, made a shipment of gold bullion and a lot of high grade concentrates. The ores average about \$10 per ton in gold, and twenty tons a day are treated.

The Sevier G. M. Co. will resume work on Gold mountain, and the blocking out of ore continued until the mill starts next spring. It is said there is enough ore blocked out to keep sixty stamps going, that will average \$14 a ton gold. There are in addition 3000 tons of tailings worth \$6 per ton.

At Fish Springs, in the Galena, a strike was made off the 500-foot level of ore that runs high in silver and lead. The report issued from the railway offices for last week shows there was delivered to the local and outside smelters 4450 tons of ore, while thirty-one carloads of bullion were billed to the refineries. No reference is made to aurocyanides sent through the express companies. Tintic furnished the greatest tonnage, Bingham next and Park City third. The report shows increase in tonnage out of Stockton. The report shows that Eastern smelters have drawn largely on the output of the camp, and at no time has so much rolling stock been required to handle it. One consignment of copper bullion was sent to Central Falls, Rhode Island.

The bullion shipment of the Eureka Hill mine, Eureka, for September, was sixty-four bars, containing gold, silver and copper. Work is to start on the Electric group of claims at Sunshine this month. The Sacramento M. Co. of Mercur made a shipment of aurocyanides last week.

The Ajax M. Co. at Mammoth shipped 100 tons of ore that runs high in copper with good values in gold.

At Park City, in Ontario preparations are being made to increase the output until it shall have become as great as it was before the closedown a year ago. The Anchor is putting out twenty-five tons of concentrates, in the production of which a little over sixty tons of crude ore is required. The zinc tailings dump is about as large as that which was purchased by the Peck concentrator, who moved 20,000 tons to the plant, where they are waiting treatment.

The Salt Lake Tribune is informed that there will be no less than four new gold mills erected on Gold mountain next season; that the Golden Star M. Co. will put up a plant is practically assured; the Chicago men purchasing four-fifths of the stock in the Deseret Co. will provide themselves with one; the Annie Laurie will put up a mill and the Mammoth has also concluded to put up a mill. In the Swansea at Silver City although large bodies of ore are blocked out, the company has decided upon a large amount of prospecting and development of new ground.

Tintic Miner: The shaft in the Joe Bowers has reached the 300 level, and stoping has begun. The shaft has gone through a good body of ore. In Tintic district on the 300 level in the Star Consolidated lead carbonate has been found which runs well in gold also. The company is placing an air compressor and machine drills and expects to sink 200 feet a month. Ore shipments for last week were 110 cars, eight carloads of concentrates and 74 bars of bullion. From Silver City shipments for the week were 39 cars of ore. The Regulator of Alta made a shipment of ore that netted \$30 a ton, and another consignment is on the way.

Bingham Bulletin: Shipments from Bingham last week averaged five carloads daily. At the Dalton & Lark work progresses on the 850 level. The face is all ore, and has a streak 18 inches to 2 feet wide of solid galena. Outside of this streak the ore carries 4½ to 35 per cent copper. The shipment for October will exceed 500 tons.

Mercur Mercury: The Columbia made another shipment of high grade ore, which brought \$50 to the ton. The Mercur mine made a shipment of cyanides amounting to 1184 pounds. The Silver King at Stockton has a body of high grade ore and is making good shipments. In the Honoline a large force is prospecting the ground. Good ore is being taken out of the Tip Top, while the Hercules, Argent and Catherine are yielding satisfactorily.

WASHINGTON.

A strike is said to have been made last Sunday in the Republic mine at Republic, on the north half of Colville reservation, of ore averaging nearly \$300 to the ton at a depth of 400 feet. The drills cut through 24 feet of ledge matter. The last 16 feet averaged fifteen ounces and the farther wall of the pay streak has not yet been encountered.

At Republic the Treasury mine has a ledge 6 feet wide, but of low grade. Work is progressing on the Golden Harvest claim. The tunnel has reached 309 feet and is driven 3 feet a day.

At Northport progress is made on the extension at the smelter. A large force is at work. Both blasts are in operation. At Wallace the Lexington mine has 3½ feet of quartz, sprinkled with galena. F. W. Fisher has taken a year's lease on the Blind Discovery and Giant claims near Kettle Falls and put men at work to develop them.

Near Chewelah the Copper King mine is developed to a depth of 325 feet by a tunnel driven 650 feet. The ore assays 40 per cent copper and \$4 per ton in gold. The Bay State has been opened by a 325-foot tunnel to a depth of 150 feet. The ore assays from \$5 to \$18 per ton gold. The ledge is 6 feet wide.

At Republic the Republic M. Co. built from two small lakes reservoirs, fed by springs, in

natural basins, the largest of which is 400 feet across. A dam has been constructed 180 feet in length and 15 feet in height. The lake is in the center of a meadow, ten acres in extent, surrounded by low bluffs. It is estimated that when full the ten acres will be covered by water an average depth of 10 feet. To utilize these lakes it was necessary to build 3200 feet of ditch.

At Colville, A. Hocksworth, a prospector, was committed to the county jail to await the sitting of the Superior Court in November, to answer to a charge of having torn down the stakes and notices of the Wild Oats claim. This is the first case brought in this county, and perhaps the first in the State, under the 1897 statute governing and protecting the stakes and notices on mining claims.

WYOMING.

In the Grand Encampment district four mines are in operation near Battle Lake, the Doane, the Haggerty, the Haskins and the Ledbetter. The Doane and Haskins are making shipments to Chicago, fifteen teams hauling the ore to Fort Steele, and the others are taking out ore to ship in the spring. Seventeen miles east of Battle Lake seven mines are said to be taking out ore. The Haggerty mine is said to have 8 feet of ore that will run 64 per cent copper and \$8 in gold to the ton. The camp at Battle Lake has about 150 men at work.

FOREIGN.

BORNEO.

The Borneo M. Co. has been in operation three years, near Sarawak. The deposits rest in a basin between high walls of rock. The gold is extracted with the aid of cyanide of potassium. The ore contains an average of \$12.50 in gold per ton. This is associated with antimony, the whole suffused with arsenious properties. The ores are silicious and readily leached. The company is crushing 250 tons a day, the mass being allowed to leach five days in a solution in which one-third of a pound of cyanide is used to the ton. The native miner is employed at 25 cents a day. In the early history of the diggings the Chinese made \$1 a day mining the antimony and casting aside the auriferous ores because their contents were not visible. The zone on which this company is operating extends into Dutch possessions about twenty miles, but its people have never undertaken to mine it. It has been traced to Sumatra, and the opinion prevails that it continues into the Philippines. Sir Charles Brooke continues undisputed ruler of the empire, and to mine there it becomes necessary to obtain a concession from the Government.

BRITISH COLUMBIA.

The Bullion group on Quartz creek, near Ymir, is to be equipped with complete machinery next spring. The property is owned by the A. I. G. M. Co. The corporation held its annual meeting recently in Rossland. The most important business transacted was in regard to the machinery for the Bullion. The Yellowstone mine, near Ymir, has been bought by the Gooderham-Blackstock corporation for \$50,000.

The Hall mines, near Nelson, will install an electric plant at the Silver King mine.

The trustees of the Cariboo M. & S. Co. announce that the assets of the company in Camp McKinney are transferred to the Cariboo Con. M. & M. Co., Ltd., of British Columbia. The output of the mine for October is about \$27,000. The output for the first half of October was 870 ounces in the cleanup, which is worth about \$13 per ounce, and about \$2000 worth of concentrates.

Victoria Times: At Texada island the Everett smelter people have bought 50,000 tons of ore from the big mine on the island owned by the Union Iron Works of San Francisco, and which is one of the most extensive iron beds to be found anywhere. The shipments the company have already taken out, which included a contract of a like amount to the present one, have only served to open it up. The smelter is paying \$50,000 for the privilege to mine. For two years the Payne mine, near Sandon, has shipped an average of fifty-eight tons of ore daily. After deducting freight, duty and smelter charges this nets the owners over \$80 per ton, or \$4640 per day. There are 125 men employed. The breaking down of the ore necessary to get these large returns has not interfered with the development of the property. A year ago the new tramway was started and assisted the economical handling of the product. The tram runs on the surface and is 5700 feet long, connecting the mine with the Kaslo & Slocan railway a mile from Sandon. Each of the cars holds four tons of ore, and can be loaded at one end and dumped at the other in five minutes. The Payne is worked largely by tunnels. The property consists of four claims.

MEXICO.

The importation of Mexican ores through El Paso averages 500 tons per day. The Sierra Mojada mines, between Chihuahua and Coahuila, are the heaviest shippers, while Parral, Pachuca and Sonora come next as to quantity, and the city of Chihuahua is third. The influx of ores by the new Sierra Madre Railway is increasing. Large quantities of Sonora ore are tributary to that line. The Sierra Mojada mines produced from Oct. 1st, '98, to July 31st, '98, 651,490,224 kilograms of ore, from which were extracted metals to the value of \$20,178,640.46. At Parral the Hidalgo M. Co., which heretofore has been shipping from \$300,000 to \$400,000

This Paper Fifty-Two Times, POST PAID, \$3.00

of silver bullion, is doubling its capacity, and other companies are increasing their output. —The first system of compressed air motive power in Mexico has been completed at the Rincon mines, near Temascaltepec, in the State of Mexico. The plant cost \$100,000.

M. C. McDonald, owner of the San Cristobal mine, Zacatecas, struck the veins on his second lead and finds the ore of good quality. (Note: W. S. Morrow of the Mesa Quemada mining district, Sonora, Mexico, has completed his tunnel into the Guillermina mine and cut a good vein of ore.)

A. M. Lohis has opened a gold mine near Ocampo, in western Chihuahua. He is running four arrastras, but contemplates building a mill.

It is estimated that the mines at Bacerac, Sonora, which G. W. Wood recently leased, will produce a large quantity of ore. The mine has been opened up along the length of the property 3600 feet, all in ore. The value of the ore shipped to El Paso has been 225 ounces silver. The gold value of the ore averages 1 ounce to the 100 ounces of silver contained in the ore. The vein varies in width from 18 inches to 13 feet.

A strike has recently been made by H. Smith in the Capulin mountains of northwestern Chihuahua near the Sierra Madre railway. The vein carries 7 feet of ore, averaging 45 ounces silver to the ton. —The Rio Concho M. Co. have begun to work the placer deposits at Santo Domingo, Chihuahua. They have put in about \$250,000 worth of machinery, pumps, roads and buildings. The placers are worked by hydraulic mining. About 5000 tons of dirt are being handled daily, which is said to yield 40 cents gold per ton, and 250 men are employed.

Two Republics: The mines of Burns & Daily near Villa Ahumada, Chihuahua, are shipping large quantities of ore. The owners shipped to El Paso one ton of ore from a pocket recently struck which yielded \$15,000. The ore is a black sulphide, though the vein carries considerable chloride of silver of high grade.

ONTARIO.

The Olive G. M. Co. have taken out enough gold with a 2-stamp mill to pay the expenses of operating the mine, installing machinery and a 10-stamp mill with air compressor plant which in a short time will be in operation.

THE PHILIPPINES.

Admiral Dewey has forwarded to the Navy Department a memorandum on mineral resources of the Philippines, prepared at the admiral's request by Prof. G. F. Becker of the United States Geological Survey. Professor Becker made considerable researches and consulted all the available authorities. Only about a score of the several hundred islands, he says, are known to contain deposits of valuable minerals. He includes a table showing the mineral-bearing islands and their resources. This table is as follows:

Luzon—Coal, gold, copper, lead, iron, sulphur, marble, kaolin.
Cataanduanes, Sibuyan, Bohol and Panay—Gold only.
Marinduque—Lead and silver.
Mindoro—Coal, gold and copper.
Carraraybatan, Rapu Rapu, Samarara and Negros—Coal only.
Masbate—Coal and copper.
Romblon—Marble.
Samar—Coal and gold.
Panay—Coal, oil, gas, gold, copper, iron and perhaps mercury.
Biliran—Sulphur only.
Leyte—Coal, oil and perhaps mercury.
Cebu—Coal, oil, gas, gold, lead, silver and iron.
Mindanao—Coal, gold, copper and platinum.
Sulu Archipelago—Pearls.

Of the coal, Mr. Becker says that it is analogous to the Japanese coal and that of Washington, but not to Welsh or Pennsylvania coal. It might better be characterized as a highly carbonized lignite, likely to contain such sulphur as iron pyrites, rendering it apt to spontaneous combustion and injurious to boiler plates. Nevertheless, he says, when pyrites seams are avoided and the lignite is properly handled it forms a valuable fuel, especially for local consumption.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING OCTOBER 25, 1898.

612,814—SOFA BED—M. Brilliant, S. F.
612,938—ROPE GRIP—H. M. Brittan, S. F.
612,883—NAIL HOLDER—L. W. Dexter, San Jose, Cal.
612,897—TUBE CONSTRUCTION—B. F. Ellis, Berkeley, Cal.
612,903—CORN PLANTER—R. L. Hoffman, Santa Ana, Cal.
612,929—INSULATOR AND HANGER—W. C. Keithly, Cal.
612,856—LAWN MOWER—P. C. Mabury, San Jose, Cal.
613,169—CARBURATOR—F. L. Martenette, Chico, Cal.
613,169—DOOR KNOB—J. W. T. Morris, Summerland, Cal.
613,075—WAVE MOTOR—J. W. Pitts, Hueneme, Cal.
613,020—TRAY TURNER—M. L. Rupp, Fresno, Cal.
612,917—STOCK FEEDING DEVICE—J. Shepard, Aptos, Cal.
612,919—SOFTENING FROZEN EARTH—J. H. L. Tuck, S. F.
612,910—WATER CYCLE—Winquist & Olsson, Oakland, Cal.

NOTE: Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Recently Declared Mining Dividends.

Swansea, Utah, \$5000; Oct. 31.
South Swansea, Utah, \$7500; Oct. 31.
Grand Central, Utah, \$31,250; Oct. 31.

Coast Industrial Notes.

—The U. S. retains the Philippines.
—Spokane, Wash., has a population of 40,000.
—California's '98 wheat crop is estimated at 500,000 tons.

—The Oakland, Cal., Industrial Exposition begins next Saturday.
—It is estimated that 25,000 freight cars are now in use in California.

—Over 5000 men are employed on railroad construction between Robson and Greenwood, B. C.

—"Good coal" is reported discovered in American territory, Alaska, 100 miles below 40-Mile river.

—Atlin lake, Alaska, is announced as a gold producing district. There have been 1500 claims recorded.

—On the 15th ult. the Oregon Legislature reduced the legal rate of interest in that State from 8 to 6%.

—The *Two Republics* says that Chihuahua capitalists will build a system of electric railways for their city.

—The total seal catch this season in Arctic waters and the North Pacific was 27,865 skins, the lightest for years.

—Hop sales in Washington county, Oregon, involving 97,000 pounds were made last week. The price paid was 15 cents.

—The Summerland, Cal., *Advance* states that the Robinson Oil Co. has leased twenty-one acres of land at Serena and will sink for oil.

—The Acme Wrecking Co. of San Francisco has made a request upon the Navy Department for authority to raise the battleship Maine.

—The Canadian government will build a railway from North Vancouver to the Lake Atlin gold fields via Bridge river and Lil-loet, B. C.

—The exportation of henequen from the port of Merida, Yucatan, Mexico, amounted during September to 4,404,161 kilos valued at \$1,026,045.25.

—San Francisco, Cal., supervisors will ask Congress to there establish a plant for the manufacture of steel armor plate. A gun plant is also in order.

—The Administration will urge the construction of the Nicaraguan canal by government aid in connection with the concession of the Maritime Canal Co.

—The water of the Bear river, southern Idaho, is to be made to irrigate 500,000 fertile acres. A dam and canal will be built. G. C. Parkinson, Preston, Idaho, is at the head.

—Redlands, Cal., contemplates changing from the horse-car to the electric street railway system. The line is three miles long and the estimated cost of the change is \$35,000.

—The Puget Sound Reduction Co., Everett, Wash., shipped sixty tons of lead last week to the American Trading Co., in Shanghai, China. It was shipped in bond to Vancouver.

—The Clearwater Valley Railroad Co. has incorporated at Salem, Or., capital \$3,000,000, to build and operate a railroad from Lewiston, Idaho, up the Snake river to Wallula, Wash.

—It is estimated that 50,000,000 pounds of freight were handled at the Keswick, Cal., railway station in October, due almost exclusively to the Mountain Copper Co.'s operations at that place.

—Hawaiian postage stamps are now recognized at their face value for the prepayment of postage on all articles mailed in Hawaii, whether addressed for delivery in the United States or elsewhere.

—A survey is being made for an electric railway between Index and Galena, Wash. The road would reach the Sunset, Silver Creek and Keystone mines, all of which would become shippers.

—Torreon, Mexico, will have the second largest cotton mill in the republic. It will be known as the La Fe. At the start it will employ over 600 hands and when in full running will carry over 2000 people on the payroll.

—The Santa Fe stockholders act on the S. F. & S. J. Valley road transfer at a special meeting to be held December 8th. The company issues a circular giving full details, which shows that they are in earnest in intent to enter San Francisco.

—The receipts of quicksilver in San Francisco the first eight months of the year were 15,935 flasks, against 10,760 the same time in 1897. The exports by sea during this period were 4257 flasks valued at \$154,966, against 3368 flasks valued at \$120,619 in 1897.

—The Robson-Pentiction branch of the Columbia & Western Railway employs 5000 men. It is 105 miles long and extends from Robson, a small town located at the junction of the Columbia and Kootenay rivers, through the Gold range of mountains to Midway, B. C.

—At San Diego, Cal., last Monday, President Ripley of the Santa Fe said that the traffic arrangement with the Southern Pacific to use its Tehachapi line as a connection had not yet been made and he thought it likely the Santa Fe would build its own line over the Tejon pass.

—The new steamship company to ply between France and San Francisco, touching at South American, Central American and Mexican ports, among which are Manzanillo, Mazatlan, Santa Rosalia and Guaymas, has notified the government at Sonora, Mexico, that the first steamer of the line has started from France.

—*Two Republics* says the Campaña Industrial at Chihuahua, Mexico, has received forty carloads of machinery for the steel works to be erected there. New buildings, all of iron, will be erected, for which the material has been ordered in the United States. These will be the first steel works in the re-

public of Mexico and will have a capacity of twenty tons daily.

—C. F. Gardner, Gen. Mgr. Westside Flume & Lumber Co., Sonora, Cal., expects by July next to have a sawmill on the north fork of the Tuolumne, and that the Sierra railroad will then have reached that point. It is proposed to establish a concern that will handle a yearly output of 15,000,000 feet of lumber.

—If the much-rumored story is true that the Union Pacific is to throw open all gateways, the Salt Lake *Tribune* thinks that the most important question to all the prairie lines and Colorado roads will be whether the Silver Bow gateway will be opened to let the Northern Pacific and Great Northern into southern Idaho.

—The issue in London, England, of £250,000 securities will be made a first charge on the first division of the line from Skaguay, Alaska, over the White pass to Lake Bennett, N. W. T., about fifty miles. The rate of interest is 6 per cent, which the contractors guarantee for two years. The line is now operated as far as the top of the pass.

—Beginning November 15 the Southern Pacific will advance rates on the following articles from California terminals to New Orleans and New York, via Sunset Gulf route—the basis of calculation being cents per 100 pounds: Antimony ore, from 50 to 60; manganese ore, 50 to 60; chrome ore, 50 to 60; canned salmon, 40 to 60; rags, 50 to 60; borax, 50 to 60; rubber junk, 50 to 60; wine in wood, 40 to 60.

—*Modern Mexico* says that the result of the war has improved the general standing of Americans in Mexico, and through the same cause many Spaniards find that they do not receive quite the same homage from the native populace that they did before their recent ignominious defeat. These changes are not marked to the casual observer, but they exist and will work to the advantage of American enterprise and trade in the Republic.

—From San Francisco to Yokohama is 4500 miles; from San Francisco to Honolulu is 2100 miles; from Honolulu to Sydney, Australia, is 3500 miles. With the exception of that from the United States, only a very small part of the trade of America goes to the Pacific. The imports of this country to Asia and Oceania, according to the latest figures, were \$119,000,000, and the exports \$67,000,000, making a total of \$186,000,000. Include the entire trade of the western continent in the Pacific, and total imports reach \$261,000,000 and the total exports \$212,000,000. Added to the trade of the older countries, the entire commerce of the Pacific is not less than \$3,600,000,000 each year, which means that \$1 in every \$7 of the world's trade now passes over those waters. Of this enormous traffic Great Britain secures the lion's share, importing \$265,000,000 and sending out goods to the value of \$335,000,000, or a total trade of \$600,000,000. The United States stands next, with a total trade in the Pacific of \$200,000,000, or one-third of that of Great Britain. Germany stands a close third, with \$100,000,000 of imports and \$45,000,000 of exports. France is fourth on the list, with about one-half the trade of Germany. The greater part of the remaining trade is divided among the eastern countries which border on the Pacific.

—W. T. Stead, writing from St. Petersburg, says: "Americans are coming to the front in Russia, which is at the beginning of a new epoch of industrial development. No one realizes the great resources of the immense country through which the Czar is running an iron highway, 8000 miles long. Americans are supplying many of the rails, American engineers are everywhere. One American is superintending the construction of the new steel works near St. Petersburg, American dredgers are to deepen the Volga, the Dnieper, the Don, and other Russian rivers. The representatives of an American pump are laying down 200 miles of 8-inch piping in the Transcaucasian region, through which the Rothschilds' oil combination will pump petroleum by means of four pumping stations, all of which will be supplied with the latest American pumps. The other day I met an American geologist and engineer who, having quit the post of City Engineer in a great American city, has been spending the summer examining the gold mines of Northern Siberia, and before the day was over I stumbled on another who had been reporting on copper mines in the Kirgi steppes. The testimony of these Americans was favorable to the labor value of the Siberian workmen. The Russian is docile, quick to learn, and does quite as good work as the skilled laborer in the States. As a craftsman, he is a past-master with his own tool, the ax."

Commercial Paragraphs.

Two 800 H. P. cross-compound, condensing Reynolds Corliss engines, built by the E. P. Allis Co. of Milwaukee, are now being erected at the works of the Butte & Boston Co., Butte, Mont.

R. J. COREY of the E. P. Allis Co., with headquarters at Butte, recently sold to the Highland Boy Gold Mining Co. of Salt Lake City 700 tons of machinery for the Highland Boy smelting plant, to be erected near Murray, Utah. This company's mines are at Bingham.

"IMPROVED BRUSH ARC LAMPS" is the title of a brochure just issued by the General Electric Co., dealing with the modifications introduced in the latest types of single and double Brush arc lamps as experience with the operation of past types has dictated. Each detail of improvement is clearly explained in conjunction with illustrations, so that any one unfamiliar with the Brush lamp mechanism will find no difficulty in grasping the import of the various changes and improvements. The pamphlet is issued from the General Electric Co.'s own printing office, and will be sent to those interested on application to any of the company's sales offices.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

APPARATUS FOR SOFTENING AND EXCAVATING FROZEN EARTH.—J. H. L. Tuck, San Francisco, Cal. No. 612,919. Dated Oct. 25th, 1898. This invention relates to an apparatus which is especially designed for softening and excavating frozen earth, so that any precious or valuable metals contained therein may be extracted. It is especially applicable to mining in high latitudes where the earth remains frozen to a great depth throughout the year. It consists of an open front caisson having a closed rear end and a cover, means for holding the caisson in contact with the surface to be excavated, a universal joint and a movable tube passing through said joint adapted to loosen and excavate the material within the caisson, a pipe extending outwardly from the cover of the caisson, a heating furnace with which the pipe is connected, a fan blower by which air is forced into the pipe, and thence into the caisson and a preliminary heater fixed to the smoke stack of the furnace having an inlet valve at one end and a pipe connecting the opposite end with the fan blower.

INSULATOR AND HANGER FOR ELECTRIC RAILWAYS.—W. C. Keithly, San Francisco, Cal. No. 612,929. Dated Oct. 25, 1898. This invention relates to improvements in insulators and hangers by which the trolley wires of electric railways are suspended. It consists essentially of an improved construction of the porcelain insulator, means for securing it within the exterior metal cap, means for securing the bolt from which the trolley wire is suspended within the interior of the insulator, means for protecting the insulator from damage by the upward spring of the trolley pole, and means for suspending the whole device above the line of wire, comprising channeled lugs upon opposite sides, arms, the upper ends of which are adapted to interlock with said lugs and the lower ends having attachments for transverse wires approximately in line with the suspending trolley wire.

WATER CYCLE.—F. O. Winquist and E. Olsson, Oakland, Cal. No. 612,920. Dated Oct. 25, 1898. This invention relates to improvements in apparatus for traveling upon the water and employing the propelling power of the rider. It consists essentially of a pair of floats with a uniting framework by which they are retained in a substantially parallel position, seats, pedal shafts and steering mechanism mounted upon the framework above the floats, a propeller shaft journaled longitudinally between the floats having propeller blades fixed thereto at a distance apart, and independent of each other, sprocket wheels and chains through which motion is communicated from the pedal and counter-shaft to the propeller shaft, the chains having their links made in a wedge shape so as to divide the water through which the links pass and reduce the friction. The steering is effected by means of rudders upon each of the floats connected with tiller ropes and steering handles in such a manner that the two rudders are turned in either direction in unison. The floats are subdivided by bulkheads and have diagonal interior braces and exterior braces which form a continuation thereof and connect with framework so that the whole apparatus is made rigid.

FOLDING SOFA-BED.—M. Brilliant, San Francisco, Cal., assignor of one-half to F. M. Plaisted of same place. No. 612,816. Dated Oct. 25, 1898. This invention relates to furniture of that class known as folding beds, sofas, chairs or couches, and is so arranged as to be conveniently extended for reclining purposes or folded into form for day use. It consists of a permanent seat frame, a back having separated pivotal and slidable supports about which it is turnable from an approximately vertical to a horizontal position, a cap piece with links by which it is hinged to the extension section so that it fits over and forms a finish for the upper end of the back and extension section when the two are in vertical position, said cap piece swinging about the connecting links so as to drop below and out of the way when the extension is unfolded. The arms have rolls divided longitudinally and hinged so that the upper part may open outwardly and form transverse extensions.

ROPE GRIP AND PROPELLING DEVICE.—H. M. Brittan, San Francisco, Cal., assignor to the Washburn & Moen Manufacturing Company, Worcester, Mass. No. 612,923. Dated Oct. 25, 1898. This invention relates to an apparatus which is especially designed to apply propelling power to a rope by means of grips which will prevent the rope from slipping, said grips grasping the rope and holding it firmly during a portion of its travel, then releasing it to allow it to continue its movement without impediment. It consists essentially of a link chain and wheels or pulleys around which the chain passes and through which motion is conveyed to it. The gripping jaws are pivoted to the links and carried by them. These jaws and the chain travel upon one side of the pulleys in the line of travel of the rope to be propelled, and they diverge to admit the rope between them having internal gripping dies. Anti-frictional bearings are carried upon the outer ends of the jaws, and these pass between ways which act to close them against the rope, thus maintaining a grip upon it during the travel of the jaws in the same direction with the rope, and at a point where the rope is to escape the grips diverge and may have devices by which they are absolutely separated to clear the rope at the point where it leaves the line of travel of the grips.

PROSPECTING BATTERY.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS : :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS

Expressly for Prospecting Work.

It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with State Law.

For the convenience of our readers in the mining counties we print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1898. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.

MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

For Testing Placer Ground.

Sinks and drives 6, 8 or 10-inch pipe through boulders; takes all the loose material out, including gold, as the hole is sunk. Does the work at a very small cost. Drills water and oil wells and mineral test wells through any kind of rock to 1500 feet. Several sizes.

Write for Catalogue and full information.

KEYSTONE DRILLER CO., Beaver Falls, Pa.

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 25 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of 3/4-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

"Union" Gas Engines,
Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS - 20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

WHITE, ROGERS & CO.,
Consulting Engineers and Millwrights,

OFFICE, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated
WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, \$450. F. O. B., San Francisco.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

— SEND FOR CIRCULARS. —

These Machines are Kept in Stock Ready for Immediate Shipment.

SPECIAL DEPARTMENT OF

Hydraulic Mining Machinery,

Comprising Hydraulic Gravel Elevators, Double-Jointed Ball-Bearing and Single-Jointed Giants, Sheet-Iron and Steel Water Pipe and Fittings, Water Gates, Etc.

NOTICE.—All other forms of Hydraulic Gravel Elevators are simply poor imitations in construction and infringements of the patents held by us. The Double-Jointed Ball-Bearing Giants recently perfected and patented by our MR. JOHN H. HENDY are incontestably superior to any other form of Giants yet introduced.

We are prepared to furnish plans and estimates of cost of any proposed Hydraulic Mining Plants upon any specifications submitted to us, and tender the services of our Hydraulic Mining Engineer to erect and place same in successful operation under guarantee.

THE GUTTA PERCHA AND RUBBER M'FG CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. We avoid this Mechanical Defect by our Spadone Curved Edge Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

We shall be pleased to quote you also on Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING and RUBBER PACKING. Correspondence Solicited.

THE OREGON SHORT LINE RAILROAD.

GOLD IN COLORADO!

Colorado has within its limits some of the great-
est gold mines that have ever been discovered. In
Grippe Creek in 1892 there were a few prospectors
looking over the hills; in 1895 the camp turned out
over \$8,000,000 in gold. Leadville, the old bonanza
camp and the mineral product of which made Den-
ver what it is to-day, is becoming a big producer of
gold. New inventions for working low-grade gold
ores, together with the discoveries made to work
rebellious ores, have opened up a field for the min-
ers such as they have never enjoyed before, and
Colorado has inducements to offer such as no other
district in the world possesses; the record of the
State in gold production for the last three years
speaks for itself. Among the other prominent
camps in the State are Telluride, Ophir, Rico,
Silverton, Mineral Point, Durango, La Plata,
Ouray, Saw Pit, Ironton, the Gunnison district and
many others. New finds are being made and new
camps are springing into existence every day.
The Denver & Rio Grande Railroad, which is the
pioneer road of Colorado and which has always
been the miner's friend, reaches all the mining
camps in Colorado. For elegantly illustrated
descriptive books, free, of mines in Colorado
send to

RADIAL DRILLING and TAPPING MACHINES.

To tap on a Radial Drill is not a success unless
done with our PATENT TAPPING ATTACHMENT,
which is placed directly on the Drill spindle, and
which is entirely automatic, no friction clutches or
reverse belts. A guaranteed saving of from 50 to 75
per cent.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

NOTICE TO CONTRACTORS.

WATER WORKS.—Sealed proposals will be received on or before 12 M., November 15th, 1898, for the construction and completion of certain additions to the existing water works, owned and controlled by the City of Seattle. The said additions include a gravity water supply from Cedar River, reservoirs and portions of an auxiliary high-service system in the city. The contract to be let will embrace the following general items of construction: Head works on Cedar River, consisting of Diverting Weir, Intake Canal (400 feet long) and Settling Basin, Pressure Pipe to City, 42 inches diameter, 28.4 miles in length; of which 6.4 miles are to be riveted steel and 22 miles to be stave-pipe banded with steel bands 1/4 inch in diameter. High-service Reservoir in City; capacity 16 million gallons. Low-service Reservoir in City; capacity 20 million gallons. Auxiliary High-service Steel Stand-Pipe, 30 feet diameter by 60 feet high, incased in Ransome concrete. Pumping Main to Stand-Pipe, 13,200 feet 12-inch Kalamain Pipe; 2600 feet 16-inch Kalamain Pipe; 36-inch Stave Pipe, connecting reservoirs, about one mile in length; 30-inch Stave Pipe, 3000 lineal feet, waste from High-service Reservoir; 30-inch Riveted Steel Pipe, 4800 feet length, connecting Low-service Reservoir with distribution system. Changing Cedar River Channel, 60,000 cubic yards excavation. Clearing, Dam and Connections at Swan Lake. Two Gate-houses, Specials, Valves, etc. The contract to be entered into will provide that payment shall be made for this work only by warrants upon the "Cedar River Water Supply Fund of Seattle," as created and established by Ordinance No. 3994 of the City of Seattle, and the contractor shall have no claim against the city except as therein provided. By said ordinance 75 per cent of the cash receipts of the entire city water system are invariably set aside and pledged to the payment of interest at 5 per cent per annum and the gradual redemption of said warrants. In addition to the warrants, which will be issued in payment for the construction of said additions, the contractor will also be required to purchase at par any and all warrants which shall be drawn on said fund by the city in such amounts as shall be required to pay for any real estate, rights, easements or privileges necessary for the prosecution of the work of construction and the perpetual control by said city of the additions to the water works herein specified, whether obtained by purchase, agreement or condemnation proceedings, and also such warrants as shall be drawn upon said fund by the city in payment of engineering and other expenses necessarily incurred in connection with said additions; provided that the amount of the warrants thus required to be purchased by the contractor shall in no case exceed the sum of Sixty-four Thousand (\$64,000) Dollars. Each bid must be accompanied by a certified check, payable to the order of the City of Seattle, for a sum not less than five (5%) per cent of the bid, and no bid will be considered unless accompanied by said check. The successful bidder will be required to enter into a contract and furnish satisfactory bond for the amount required by the City Charter and the laws of the State of Washington, within ten days after being notified of the award of the contract to him; failing so to do, the said check and the amount fixed therein will be forfeited to the city. No person is eligible as a bidder who has within two years prior to the letting of said contract made default in payment of any just claim for any work or labor performed, or any skill or material furnished pursuant to any such contract as herein advertised, or who within said two years failed to complete any such contracts. Special attention is called to Article XXIII of the City Charter, as now in force, relating to "hours of labor," and to Article XIII, Section 31, Subs. 1 and 2, relating to bonds and sureties. All bids must be made in accordance and comply with the plans and specifications now on file in the City Engineer's Office, and in compliance with Ordinance No. 3990. The City of Seattle reserves the right to reject any and all bids. Proposals must be indorsed on envelope "Bids for Constructing Certain Additions to the Water Works of the City of Seattle." By order of the Board of Public Works.

THE BEST BOOKS
Are always the CHEAPEST. All the latest and best works on Mining, Metallurgical, Electrical and kindred subjects can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of Standard Mining Works and Scientific Publications.
MINING AND SCIENTIFIC PRESS,
330 Market Street.....San Francisco, Cal.

- Assaying.—Part I—Gold and Silver Ores.**
Third edition: Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth: 1896. Price, postpaid.....\$1 00
- Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.**
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....\$1 75
- Prospector's Field Book and Guide.**
By H. S. Osborn.....\$1 50
- Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.**
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, equipments and working apparatus. Price, postpaid.....\$3 00
- Modern Copper Smelting.**
By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated.....\$5 00
- Practical Treatise on Hydraulic Mining.**
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-rurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....\$5 00
- Practical Hydraulics.**
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that they can be used at a moment. For the engineer the principles, formulae, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, \$2
- The Explorer's and Assayers' Companion.**
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....\$6 00
- The Metallurgy of Gold.**
By M. Elsler. Profusely illustrated.....\$5 00
- Cyanide Processes for Gold and Silver Ores.**
By E. B. Wilson, E. M. 12mo., cloth.....\$1 50
- Quartz Operator's Handbook.**
By P. M. Randall.....\$2 00
- Skeleton Mining Report.**
Or great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid.....50 cts.
- Stamp Milling of Gold Ores.**
By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....\$2 50
- Miners' Pocketbook.**
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather.....\$5 00
- Manual of Mining.**
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Third, revised and enlarged, edition. 648 pages, 8vo., cloth.....\$4 00
- The Lixiviation of Silver Ores with Hyposulphite Solutions.**
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....\$5 00

MINERS, ATTENTION!

We beg to call attention to our RISDON HAMMERED PROJECTILE STEEL SHOES AND DIES, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density. These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend itself to all mine owners and mill men.

W. A. M. VAN BOKKELLEN has been chosen Sec. Central Eureka M. Co. of Amador county, Cal., with offices at 320 Sansome St., San Francisco.

P. KERVIN, Supt. Con. Virginia mine, Virginia, Nevada, has returned from the Allison Ranch mine, of which he is Gen. Mgr., at Grass Valley, Cal.

C. A. MOLSON, Gen. Mgr. Tomboy mine, Telluride, Colo., has returned home from Idaho, where he has been examining mining properties for Eastern people.

S. NEWHOUSE, of the Highland Boy mine, Bingham, has gone to Durango, Mexico, to inspect operations on properties owned by himself and associates in that country.

K. S. AGAPOFF, an M. E. from Siberia, is in Grass Valley, Cal., commissioned by the Russian Government to visit mining localities to study the modern methods of working mines.

D. A. MACDONALD, an experienced prospector and old California miner, has returned from Golovan Bay, Alaska, and will winter in San Francisco. He returns early in '99 to a rich claim that he secured.

COL. SAMUEL L. MANSFIELD, corps of engineers of the United States army, has been appointed a member of the California Debris Commission. Col. Mansfield is a native of Connecticut and a graduate of the Military Academy.

OTTO STALMAN, Gen. Mgr. for the Glasgow & Western Co. of Golconda, Nevada, has returned to Salt Lake City from the West. On his trip Mr. Stalman went as far as California, whence he reports to the S. L. Tribune greater interest in mining than at any period since the boom in Comstocks. Some of the big properties are suffering, he says, through a lack of water, which promises to be overcome with the installation of electrical energies, while a large amount of work is being done on prospects.

Recent Mining Incorporations.

Red Banks M. Co., San Francisco; capital stock \$100,000, subscribed \$250; A. Wartwister, H. Bratnober, J. Solinger, T. Mein, L. H. Mooser.

Sam Houston M. Co., San Francisco; capital stock \$100,000, subscribed \$25; H. M. Owens, J. H. Henderson, R. T. Owens, J. C. Owens, C. M. High.

Star Gulch M. Co., San Francisco; capital stock \$50,000, subscribed \$5; R. H. Blake, L. R. Han, F. Reichert, J. H. Barnard, A. J. Robinson.

Bob Roy M. Co., San Francisco; capital stock \$100,000, subscribed \$1000; N. Davis, R. Davis, A. Davis, E. Davis, A. Appell.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 3, 1898.

SILVER.—London, 28½d; New York, 61½; San Francisco, 61½; Mexican Dollars, 47½@47¾. New York exchange, sight, 17½; telegraphic, 20 cents premium.

The Boston News Bureau of Oct. 25th says: "The cashier of the Bank of California tells us that the accumulation of gold in California is making it a kind of a drug on the market there. There is so much of it that it is driving out paper money. Travelers to California recently notice that it is difficult to get bills and that gold is in common use there. Some merchants in some of the leading business centers in California say that they hardly see a bill from one day to the other. This condition of things is expected to lead to a sending of a lot of gold to this market before long." There never was any "paper money" in California to "drive out." "Travelers to California," and others have for forty years "noticed that it is difficult to get bills." The excerpt sounds funny to coast residents, especially the announcement that "gold is in common use there."

Government receipts for October were about \$40,000,000, of which \$17,000,000 represented customs payments and \$23,000,000 internal revenue. Customs collections in this collection district in October were \$478,880, against \$426,100 in October, 1897, and for the first ten months of the year \$5,095,608, against \$4,278,700 in 1897.

LEAD.—New York reports "firm;" \$3.70 bid, \$3.75 asked. The firm naming the settling price for mines and smelters quotes lead at \$3.50. Local, pipe, 6@6½c; sheet, 6½@7c; pig, 5½c; bar, 6c.

COPPER.—New York reports Lake unchanged, \$12.50@12.70. Boston reports:

"Mail advices under date of Oct. 15 show a rise in Anaconda copper shares at London to £5 2s 6d. Rio Tinto's on same date were quoted at £29 7s 6d.

"Anaconda is paying stockholders 10% per annum and Rio Tinto 40% per annum on their respective capitalization. The former has no bonded indebtedness, while the latter has outstanding £3,489,860 of 4% first mortgage bonds. Rio Tinto produced last year 75,989,760 pounds fine copper, against 124,417,471 pounds fine copper by the Anaconda. With about 50,000,000 pounds less output than Anaconda, the Rio Tinto pays in dividends over \$3,000,000 yearly on its ordinary shares, besides 5% on its preference shares, compared with the Anaconda's dividends of \$3,000,000 annually.

"Rio Tinto's share capital amounts to £3,250,000, divided equally into 5% preference shares, and ordinary shares both of £5 each fully paid up. Anaconda has 1,200,000 shares of \$5 each paid in, or \$30,000,000. The Rio Tinto divided last year equivalent to over 4c per pound on its copper output, compared with a little less than 2½c per pound on Anaconda copper output."

IRON.—American, soft, \$21.50 and \$23.50 per ton; Scotch, \$24.

SPELTER.—5½@5¾.

TIN.—Menlo Roofing, redipped, \$7; English, to arrive, \$4.50; Pig, 18c; Bar, 19c.

ANTIMONY.—9½, 10.

BABBITT METAL.—10-12-14—best 16c.

QUICKSILVER.—Domestic, quiet, \$41; export, \$37.00@37.50; carload lots, special rates.

POWDER.—F. O. B., San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1* 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

FUSE.—Triple tape, \$5.10 per 1000 feet; double tape, \$4.35; single tape, \$3.45; Hemp, \$3; Cement No. 2, \$4.35; Cement No. 1, \$3.45.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9.

COAL.—San Francisco coast, yard prices: Wellington, \$8 00 Coos Bay, \$8 00 Seattle, \$6 00 Southfield, \$7 50

Cargo lots, Eastern and foreign: Wallsend, \$7 50 Cumberland, \$9 00 Brymbo, \$7 50 Cannel, \$9 50 Pennsylvania, hd., 14 50 Welsh Anthracite, 12 50 Scotch, \$8 00 Rock Springs, \$7 60

Receipts of coal at San Francisco in October were 156,327 tons, against 134,300 in October, 1897. For the first ten months of the year they were 1,221,000 tons, against 1,150,400 during the same time in 1897, and included 466,135 tons Puget Sound, 169,200 Australian, and 443,000 British Columbia.

COKE.—Foreign, \$13; domestic, \$12 per ton.

OILS.—California Castor, pure, cs., \$1.08 per gal.; bbl., \$1.03; pure No. 2, cs., 85c; bbl., 80c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, \$1.06; less than 200 gals., \$1.10; in bbls., 4c per gal. less than case; Baker's Crystal, \$1.26; China Nut, 52c; Linseed, strictly pure, boiled, bbl., 44c; cs., 49c; raw, bbl., 42c; cs., 47c; lots of 5 bbls., 1c less; Lucid, boiled, bbl., 39c; cs., 43c; raw, bbl., 36c; cs., 41c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 17½c; Astral, 17½c; Star, 17½c; Eocene, 19½c; Extra Star, 21½c; Elaine, 22½c; Water White, bulk, in tanks, 11½c; Mineral Seal, iron bbls., 21c; wooden bbls., 23½c; cs., 26c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 13c; do., cs., 18c; 86 deg. Gasoline, bulk, 20c; do., cs., 25c; 63 deg. Naphtha or Benzine, deodorized, in bulk, per gal., 11½c; do., in cs., 16½c; Lard Oil, Extra Winter Strained, bbl., 56c; cs., 61c; No. 1 bbl., 46c; cs., 51c; Neatsfoot Oil, bbl., 65c; cs., 70c; No. 1 bbl., 55c; cs.,

Placer Miners' Attention

Is called to the fact that we are purchasers of

OSM-IRIDIUM

In lots of one ounce and upwards.

SELBY SMELTING & LEAD CO., 416 Montgomery Street, San Francisco.

FRESNO, June 25, 1898.

Hercules Gas Engine Works,
San Francisco, Cal.

DEAR SIR:—

The fifteen-horse power gasoline engine and hoist purchased from you is doing fine work and is perfectly satisfactory in every respect.

Yours truly,

TUOLUMNE MOTHER LODE
M. & D. CO.,

Per N. W. Moodey, Pres.

We have two large books full of testimonials; they speak better for the HERCULES than we can. Our works are the largest in the country. We have built and sold over 3500 engines; they are the standard everywhere. Any size up to 200 H. P. Stationary, Hoisting and Marine.

Hercules Gas Engine Works,

405-407 SANSOME STREET,

SAN FRANCISCO, CAL.

Acetylene Gas.

A handsome new illustrated catalogue will tell you where and by whom the new light is being used, and what the verdict is. Mailed upon application. PACIFIC ACETYLENE GAS CO., 115 New Montgomery St., San Francisco.

PRESCOTT, ARIZONA.
A Valuable Gold Property for Sale.

WANTED.

Position as Mine and Mill
Superintendent.

Thoroughly practical. Highest references furnished. California preferred. Address L. care of Mining and Scientific Press, San Francisco.

Mine Wanted.

Mining man of experience wants partially developed mine with ORE CHUTE IN SIGHT, either in the United States or Mexico. Will develop further for one-half interest, or build mill if ore in sight justifies, or will bond whole mine and develop. Describe conditions fully. State length, width, course and dip of pay chute. State values free and concentrating, also percentage and value of concentrates. Give diagram of present development, showing position of ore chute. Mark places where samples were taken. State if samples were an average of the whole vein. How values are determined: by pan, fire, assay or mill run. Give careful attention to details, saving time and correspondence. Will treat with owners only. Satisfactory reference. Address Box 887, Los Angeles, California.

PACIFIC EXPLORATION COMPANY
Finds buyers or working capital for meritorious mines or good prospects. Correspondence invited.
W. E. Holbrook, Pres't. L. F. Haskell, Sec'y.

Catalogues Received.

The finest trade publication received this week comes "with the compliments of the Denver Fire Clay Co.," 278 pages, quarto; maroon binding. It contains description, illustrations and prices of articles in daily use by assayers, smelters, mill men and metallurgists generally, with a particularly valuable catalogue of chemicals, and their prices. The work is divided into six parts, and is most conveniently indexed. A copy will be mailed to any address upon request. It is issued by the Denver Fire Clay Co., 1742 Champa St., Denver, Colo.

Books Received.

"Elements of Sanitary Engineering," by Mansfield Merriman; octavo, pp. 216. Five chapters, on sanitary science, water and its purification, water supply systems, sewerage systems, disposal of garbage and sewage. John Wiley & Sons, New York; \$2.

Assessment Notices.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill, Placer County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 23rd day of October, 1898, an assessment (No. 14) of one-half of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 1209 Claus Spreckels building, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 23rd day of November, 1898, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 14th day of December, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
J. J. CRAWFORD, Secretary.
Office—No. 1209 Claus Spreckels Bldg., San Francisco, California.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of October, 1898, an assessment (No. 21) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 106 Leidesdorf street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 7th day of November, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of November, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
CALVERT MEADE, Secretary.
Office—106 Leidesdorf street, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 3rd day of October, 1898, an assessment (No. 11) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 237 12th street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 7th day of November, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 5th day of December, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
F. METTMANN, Secretary.
Office—237 12th street, San Francisco, California. The Secretary will also receive payments from 12 to 6 P. M. at his business office, 225 Sansome street.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from the Excelsior Mining Co., in the Excelsior Mine at Lowell Hill, Nevada Co., to deposit tailings in the North Fork of Steep Hollow; from Toy Kee, in the Fair Play Mine near Seales, Sierra Co., to deposit tailings in Fair Play Ravine; from S. F. Bullard and A. M. Gray, in the Gravel Hill or McCutcheon Placer Mine near Nevada City, Nevada Co., to deposit tailings in Little Deer Creek; and from Elmore Rutherford, in the Plumas Bonanza Gravel Mine near Buck's Ranch, Plumas Co., to deposit tailings in Sherman Ravine, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal., on November 7, 1898, at 1:30 P. M.

ORE BUYERS AND EXPORTERS. - MINING SUPPLIES.

To Our Customers and Friends
on the Pacific Coast:

Through frequent complaints made to us, we have learned that unprincipled and dishonest dealers on the Pacific coast have counterfeited our trademark numbers and substituted inferior, spurious goods as ours, when ours were distinctly ordered, thus defrauding the customers and injuring our trade and reputation.

Our goods are acknowledged to be the best, and are fully marked with our initials or with our mark and catalogue.

We request direct notice if any goods alleged to come from us, or bearing our trademark or numbers, prove to be other than the best, and perfect in every respect, as we will follow up and expose such frauds for our customers' and our own protection. We have no exclusive agents on the Coast, but our goods are obtainable from all respectable dealers in drawing materials, stationery, hardware, artists' material, etc. Respectfully,

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

The Diesel Motor.

The explosive force of suddenly liberated heat has long been utilized as a motive power, and for the last fifteen years a Bavarian, Rudolf Diesel, has been working on a heat motor which, as now building at Augsburg, is attracting some attention.

Fig. 1 is a theoretical diagram of the engine. The operation is as follows: On one down-stroke the main cylinder is filled with pure air, the next up-stroke compresses this to thirty-five atmospheres, creating a temperature sufficient to ignite the fuel and the pressure rises along the line marked P_1, P_2 . At the beginning of the next down-stroke, the fuel valve opens, and the petroleum, atomized by passing through fine wire netting, is injected into this red-hot air, resulting in combustion keeping the temperature up to that at P_2 ; the resulting expansion P_2, P_3 being made while the air is at a constant temperature. At P_3 the fuel is cut off and the temperature falls, but the amount of heat in the air remains the same, the pressure continuing to fall along another curve P_3, P_4 , similar to the compression curve P_1, P_2 , until the end of the stroke is reached.

The mechanism of the Diesel motor is illustrated in Figs. 3, 4, and 5. Fig. 3 is a side elevation of the engine, Fig. 4 is a vertical section through the line 1-2, Fig. 3. Fig. 4 also shows a plan of the bedplate, the pillow-block and the crank shaft. Fig. 5 is section at right angles to that in Fig. 4. Each part of the engine is designated by the same letter in each figure. Referring to the figure, A is the cylinder, B the piston, and C the compression space, which is about 6 per cent of the volume behind the piston when the piston is at the extreme lower end of the stroke, or about 7.5 per cent of the volume swept over by the piston during one complete stroke. The piston is not of the trunk type so frequent in gas-engine practice, but has a piston rod D , necessitating the use of a cross-head k to keep the motion of the rod in a straight line. Motion is transmitted to the crank shaft S by the connecting rod N and the crank pin U . A water-jacket surrounds the cylinder, as shown at J , and water is also passed about the valves through the space J' in the cylinder head.

The air pressure required for starting and for injection of liquid fuel, when such is used, is supplied by the pump p , operated by levers x, y and z , from the connecting rod N , the pump having a stroke equal to one-half that of the piston. The pump cylinder is water-jacketed, as shown at j, j . The compressed air is stored in the starting tank T , at a pressure of about 100 pounds above the maximum pressure obtained after compression. That the pressure may be kept at the proper point, the suction pipe of the air pump is controlled by an automatic valve, which contracts the opening when the pressure rises in the tank T .

A small oil pump, bolted to the base plate, supplies the fuel to the fuel valve m . The oil enters this

through the small pipe at o and falls to the bottom of the valve compartment o' . When the piston reaches the end of its compression stroke the fuel valve m opens and the fuel in o is blown into the compression space C , where it is ignited by the hot air

FIG. 1.

FIG. 3.

FIG. 4.

FIG. 5.

THE DIESEL MOTOR.

in C . The amount of fuel varies according to the requirements of the engine and is regulated by the governor g . The governor controls the fuel pump by the lever l . Part of the oil returns to the tank through a by-pass valve.

The exhaust valve c , air valve d and fuel valve m are all of the poppet type, operating by means of cams from the valve shaft V and a system of levers, as shown at h , Fig. 4. The valve shaft V is horizontal, and is driven from a vertical shaft V' by means of bevel gears. V' is also driven from the crank shaft S by means of a pair of bevel gears, the gear on V' making but one revolution to two revolutions of the crank shaft. The bevel gears, by which the horizontal shaft V is driven from V' , have the same number of teeth; hence, both V and V' revolve at the same speed, and V makes one revolution to two revolutions of the crank shaft.

In starting the motor a hand valve is pulled to one side, throwing all the cams, except the exhaust-valve cam, out of gear, and throwing a special cam into gear with the starting valve. The fuel pump is

disconnected from the engine and attached to the hand lever L . The flywheel is then turned by means of a bar, supplied for that purpose, until the crank is upon the upper center, or in the position shown in Fig. 4. The tank valve r is then opened, admitting air to the starting valve s . Valve s is thrown open by means of the starting lever H , admitting air from T into the compression space. The flywheel is then turned by means of the bar until the crankpin is far enough from the center to permit the air pressure from T to start the engine. At 30 per cent of the down stroke the starting valve s is closed, and the admitted air expands until the end of the stroke. During the next upstroke of the piston, exhaust takes place; and, just before the piston reaches the top of the stroke, the starting cam is thrown out of gear, the fuel cam put into gear automatically by a screw spring and the engine takes up its regular process as follows: (1) Downstroke, suction of air; upstroke, compression of air. (2) Downstroke, injection of oil, combustion to 10 per cent of the stroke and expansion of the burned gases; upstroke, exhaust. The cylinder A is bolted to the engine frame O , and O is in turn bolted to the bed P . Catch

basins for the oil are placed below the crosshead at b and at the end of the piston travel at b' .

The pressure within the starting tank is shown on the gauge G . The air enters the cylinder at R , and the exhaust gases escape at E . The tank T is fastened to the wall of the engine-room by means of the brackets f . To oil the piston regularly the lever arm y has another arm x' attached to it which drives the oiling device by means of the levers y' and z' . The arm z' carries a pawl, which engages a ratchet v . The ratchet v is fastened to the shaft v' , which carries a worm, engaging the worm-wheel u . The worm-wheel u is threaded, making it a nut which turns on the threaded plunger u' . The plunger u' sits on top of the oil in the

cylinder q . Just as the engine piston reaches the lower end of its stroke, the pawl engages the ratchet, forcing a small quantity of oil just below the top piston ring, oiling the piston at a point from which the oil will be thoroughly distributed.

In the device thus described Diesel makes a sharp distinction between the temperature of ignition and the temperature of combustion; the first is a constant value at each pressure and dependent only on the physical qualities of the fuel; the higher the pressure the lower the temperature of ignition. The temperature of combustion, on the other hand, is variable, depends on many conditions, and especially on the quality of the air by which the combustion is maintained, but it is always higher than the temperature of ignition. Diesel's radical departure from all previous practice is in generating a combustion temperature by mechanical compression of pure air, utilizing this temperature to ignite the fuel, and by so introducing the fuel that the heat lost by expansion is practically balanced by the heat added by combustion.

Miners' Associations.

Now that the elections are over, it is in order to bring up the matter of miners' associations. In common with other trades and business, it is requisite that mining men should have regularly organized associations in their several States for mutual aid and advancement. This has been recognized in a variety of instances, more especially in this State, where for the last seven years has existed what is known as the California State Miners' Association. In nine days will be held the seventh annual convention of that body in San Francisco. As a well wisher of that organization, it is believed that some changes in its policy and mode of operation would be beneficial to it and the interests it represents. The California State Miners' Association from its inception has been fortunate in securing the unpaid services of men of skill, intelligence, integrity and practical ability. Men connected with it in every capacity have been noted for unselfish effort, singleness of purpose and devotion to all that it represents. It is often the fate of such an organization to become the prey of designing men, who use it and drop it when it has served their own private interests. In this case the California State Miners' Association deserves congratulation, and that its good fortune may continue in this as in all other regards is, of course, the earnest wish of everyone connected with it. The general plan of the Association is excellent, but it needs revivification; life should be infused into it by earnest effort, and the great body of miners in the commonwealth should be given opportunity to realize its benefits to them and to join it. The first question a man asks regarding any association is, "What good is it going to do me?" The purpose of any association, fraternal or otherwise, is for the individual as well as for the general good, and if it fails in aiding the one it does in the other. The California State Miners' Association is of value to every miner in the State, and could be made more valuable. It needs an officer whose pleasure and privilege it would be, and whose province and purpose it should be, to visit every part of the State of California, giving mining men full knowledge of the objects and work of the Association, securing their membership, active interest and friendly co-operation, and organizing county miners' associations in each of the thirty-seven mining counties. As it is at present, it is a State Association only in name. There are large areas of this State in which there is not one member of the Association. Take, for instance, seven of the southern counties where a great deal of mining is going on, and where the mining interests are of importance. In each of those counties there should be a county miners' association. This missionary work is a present need. To the MINING AND SCIENTIFIC PRESS it seems to be an equally present requirement that a considerable portion of the revenue of the Association be devoted to suitable headquarters, and to the maintenance of a secretary or other officer whose sole business it

should be to attend to the Association, to make it headquarters for miners, to reply to their answers, and to supply all just requirements connected with their membership. It would take every moment of a busy man's time to attend to these things, and to a competent man filling such a position it should be worth as much money as a business man would pay an intelligent, active and competent man to do such work for him.

What has been done in this regard is but the index of what could and should be done, the possibilities being so manifest and the time so opportune. It is manifest to every member of the Association that new membership and more active interest are necessary.

It would be well to have similar associations in every State and Territory in this west half of America for the sole purpose of advancing mining interests. Organization is essential in all things, and it is by State and Territorial organization and mutual co-operation and effort that some necessary factors in progress can be best secured.

Tunnels and Tunnel Sites.

In answer to several questions from Colorado and California, it is stated that the bill introduced by Congressman Bell of Colorado at the last session of Congress, to change the Revised Statutes of the United States relative to tunnel sites, passed the House of Representatives, but did not pass the Senate. It will probably be acted upon affirmatively by both Houses at the coming session. Meanwhile the law stands unchanged. The Congressional Committee recommending the bill last April said:

A discovery from the surface entitles the miner to 1500 feet in length and 600 feet in width, and also the same area when the discovery is made in a tunnel. Tunnels are usually run at right angles to the general course of the veins. The Supreme Court has held that the tunnel claimant may take his whole claim on either side of the tunnel that he may desire after he cuts the vein, and he is required to give no notice nor to protest against any one applying for a patent on any ground within 1500 feet of the line of the tunnel. Yet when he cuts a vein in the tunnel he may take his claim all on one side, though it covers ground actually purchased of the Government by others within the 1500-foot limit.

The evil that section of the bill seeks to cure is to confine the rights of the tunnel claimant to 750 feet on each side of the line of the tunnel, should the extension of the claim beyond 750 feet from the line of the tunnel conflict with the rights of any prior locator. If the tunnel claimant does not conflict with any other locator, he may, under Section 1 of this bill, take a full claim on one or both sides of the line of the tunnel. As the law now stands, the claimant is entitled to only 1500 feet of the vein; but, not being confined to either side or to any portion on one side and the remainder on the other, and having the right to choose his whole claim on either side, or a part on one side and the remainder on the other, renders any one locating a claim within 1500 feet of the line on either side of the tunnel subject to the will of the tunnel claimant if he cuts the same vein, or in effect severs it, and there are 3000 feet in width out of which he can only extend his lines 1500 feet.

Section 2 simply requires a tunnel claimant to stake his claim at the surface and record the claim within sixty days from the time the vein is cut; otherwise it will be deemed that he has abandoned the same, should any locator discover the same claim outside of the tunnel and locate the same. These lands are sold by the Government to the claimants for \$5 per acre; and the interest of the Government, as well as that of the prospectors, requires that there should be no ambiguity about the intention of claimants or as to the specific ground desired.

Section 3 of the bill gives the claimant all ore from the point touched to the surface, even though the apex of the vein may depart from the side lines.

The above excerpt applies to the proposed change.

The following, relative to the law as it stands, is furnished by the Commissioner of the General Land Office and the Secretary of the Interior:

SEC. 3223, R. S. Where a tunnel is run for the development of a vein or lode, or for the discovery of mines, the owners of such tunnel shall have the right of possession of all veins or lodes within three thousand feet from the face of such tunnel on the line thereof, not previously known to exist, discovered in such tunnel, to the same extent as if discovered from the surface; and locations on the line of such tunnel of veins or lodes not appearing on the surface, made by other parties after the commencement of the tunnel, and while the same is being prosecuted with reasonable diligence, shall be invalid; but failure to prosecute the work on the tunnel for six months shall be considered as an abandonment of the right to all undiscovered veins on the line of such tunnel.

The effect of this is simply to give the proprietors of a mining tunnel run in good faith the possessory right to fifteen hundred feet of any blind lodes cut, discovered, or intersected by such tunnel, which were not previously known to exist, within three thousand feet from the face or point of commencement of such tunnel, and to prohibit other parties, after the commencement of the tunnel, from prospecting for and

making locations of lodes on the line thereof and within said distance of three thousand feet, unless such lodes appear upon the surface or were previously known to exist.

The term "face," as used in said section, is construed and held to mean the first working face formed in the tunnel, and to signify the point at which the tunnel actually enters cover; it being from this point that the three thousand feet are to be counted upon which prospecting is prohibited as aforesaid.

To avail themselves of the benefits of this provision of the law, the proprietors of a mining tunnel will be required, at the time they enter cover as aforesaid, to give proper notice of their tunnel location by erecting a substantial post, board, or monument at the face or point of commencement thereof, upon which should be posted a good and sufficient notice, giving the names of the parties or company claiming the tunnel right; the actual or proposed course or direction of the tunnel; the height and width thereof, and the course and distance from such face or point of commencement to some permanent well-known objects in the vicinity by which to fix and determine the locus in manner heretofore set forth applicable to locations of veins or lodes, and at the time of posting such notice they shall, in order that miners or prospectors may be enabled to determine whether or not they are within the lines of the tunnel, establish the boundary lines thereof, by stakes or monuments placed along such lines at proper intervals, to the terminus of the three thousand feet from the face or point of commencement of the tunnel, and the lines so marked will define and govern as to the specific boundaries within which prospecting for lodes not previously known to exist is prohibited while work on the tunnel is being prosecuted with reasonable diligence.

At the time of posting notice and marking out the lines of the tunnel as aforesaid, a full and correct copy of such notice of location defining the tunnel claim must be filed for record with the mining recorder of the district, to which notice must be attached the sworn statement or declaration of the owners, claimants, or projectors of such tunnel, setting forth the facts in the case; stating the amount expended by themselves and their predecessors in interest in prosecuting work thereon; the extent of the work performed, and that it is *bona fide* their intention to prosecute work on the tunnel so located and described with reasonable diligence for the development of a vein or lode, or for the discovery of mines, or both, as the case may be. This notice of location must be duly recorded, and, with the said sworn statement attached, kept on the recorder's files for future reference.

By a compliance with the foregoing much needless difficulty will be avoided, and the way for the adjustment of legal rights acquired by virtue of said section 2323 will be made much more easy and certain.

The office proposes to take particular care that no improper advantage is taken of this provision of law by parties making or professing to make tunnel locations, ostensibly for the purposes named in the statute, but really for the purpose of monopolizing the lands lying in front of their tunnels to the detriment of the mining interests and to the exclusion of *bona fide* prospectors or miners, but will hold such tunnel claimants to a strict compliance with the terms of the statutes; and a reasonable diligence on their part in prosecuting the work is one of the essential conditions of their implied contract. Negligence or want of due diligence will be construed as working a forfeiture of their right to all undiscovered veins on the line of such tunnel.

"WHAT title have the drillers of the oil wells under the sea near Summerland, Cal.?" is the question repeatedly received since the publication of an illustrated article thereon in the issue of Oct. 15. As a strict legal proposition, they have no title except the fact of possession. The matter was discussed on page 455 of last week's issue. In addition it may be said that those oil men can hold their claims by possession against all comers except the State. The State can compel them to vacate at any time, but it is not likely to do so. The operators have a franchise from the county for the wharf alongside of which the well is sunk. Since the appearance of the article the wells have an average depth of 400 feet, and are now daily bringing up 150 barrels of oil from under the sea, more wells being in progress of sinking farther out to sea.

THE thirteenth annual report of the Department of Labor, issued at Washington, D. C., gives some noticeable statistics, showing the increased use of machinery in production, and the result. In '91 the cost of mining 100 tons of bituminous coal was \$77.60; time required, 342 hours. In '97 to produce the same work required 188 hours, at a cost of \$43.30. It is also to be noted that in '91 the number of men in the equation was 42; in '97, 32. In nearly every department of human labor similar results are shown in the Government publication.

Concentrates.

ROSSLAND, B. C., wants a school of mines.

THERE are 40,000 placer gold miners in Siberia.

THERE are no copper mines for sale in New Mexico.

THE United States flag now floats forever in the sunlight.

THE daily average ore shipment from Rossland, B. C., is 500 tons.

IN a 10-stamp battery, dropping 1, 5, 9, 7, 3, 2, 6, 10, 8, 4 gives good results.

THE Congress mine in Yavapai county, Arizona, has reached 1700 feet depth.

THE ordinary concentrator requires from 200 to 300 gallons of water per hour.

THE salary of Gold Commissioner Ogilvie at Dawson, N. W. T., is \$4000 a year.

IN electrical units the equivalent of a "horse power" is 746 volt-amperes or watts.

JANUARY 1, 1894, silver was quoted at 31½¢ per ounce in London; on December 31st, '94, 27¼¢.

WITHIN a radius of ten miles of Deadwood, S. D., several new ore reduction plants will soon be built.

THE altitude of Mt. Shasta is 14,440 ft.; of Mt. Whitney 14,522 ft.; distance between the two 466 miles.

THE gas consumed in one 16 C. P. gas jet, if consumed in a gas engine, will produce three 16 C. P. electric lights.

IN San Miguel county, Colo., mining gives employment to 1350 men and outputs 950 tons daily throughout the year.

THE highest temperature at a depth of 1800 feet that has been found in the Butte, Montana, copper mines is 73° F.

SOUTH AUSTRALIA wants to repudiate its agreement with the Gold Recovery Co. there and annul the agreed obligations.

THE government reports for '97 give a total production of iron of \$95,122,299. The production of gold and silver was \$127,000,172.

W. CAIN and P. Nolan, trying to escape from bad air in the Sunset mine No. 2 at Rossland, B. C., last week, fell from the ladder and were killed.

AN ounce of gold is worth three times what it was when the gold product of California was \$50,000,000 annually in point of purchasing power.

BUT one discovery of mineral is required to support a placer location, whether it be of twenty acres by an individual or of 160 acres by an association of persons.

WITH 150-foot head a 2-inch nozzle to operate a hydraulic elevator would need about 100 miners' inches, which equals a flow of about 2½ cubic feet per second.

THE United States Mint seigniorage on silver dollars is the difference between the current rate of silver per oz. and \$1.29, being now 68 cents, less the cost of coinage.

NEWSPAPER assertions regarding the Republic, Wash., ore are to the effect that the last two cars shipped to the smelter gave net returns of \$15,000—15½ ozs. gold per ton.

A GOOD compound for welding steel is made of one part of sal-ammoniac and ten parts borax crushed together, fused till clear, then poured out, and, after cooling, reduced to powder.

PLATINOID is an alloy of copper, nickel, zinc in the proportion of German silver with 1 or 2% tungsten, and is used for electric resistance, having a specific resistance of 33 microhms.

TUNGSTEN is defined as a heavy stone, whitish color, of 184.0 atomic weight and 19.26 specific gravity, its fusing or melting point being of very high degree. It occurs mainly in wolframite.

THE gallows-frame at the War Eagle mine at Rossland, B. C., made entirely of steel, is 120 feet high, and is claimed to be the largest "headgear" erected over a quartz mine anywhere.

A WELL AUTHENTICATED case of gold and tin being found together in place is reported from the Royal Tasman mine, near Gladstone, in northeastern Tasmania, where gold and cassiterite are reported to have been so found, the only case of the kind known.

TALC ORE has been successfully treated by washing and separating at the Lillian mine, Pewabic, Russell district, Gilpin Co., Colo., hand-jigging giving the result of a close saving of values.

SUPR. HARVEY of the Republic mine, Republic, Wash., says that in running a tunnel they made in October an average of 13 feet a day, which he maintains breaks "all mining records on the Pacific coast."

IN the Slocan, B. C., district, capital is being secured to begin the long-talked-of project of cutting a 10,000-foot tunnel below Sandon through Noble Five mountain, cutting five lodges at a depth of 4000 feet.

BRITISH COLUMBIA ASSAYERS want the Government assay office abolished, because of its competition with private business, they disliking to pay taxes for the support of an institution that competes with them for private business.

WHAT "economy" in mining can do and what can be attained in that direction is strikingly shown in the reports of the Broken Hill (Australia) Proprietary Co., where the average cost per ton of ore treated has been reduced from £6 15s 4d to £2 3s 7d.

"THE Vancouver Smelting Co." is an embryo London organization; capital £200,000. The proposition is to build a smelter with a daily capacity of 100 tons at Burrard Inlet, Vancouver, B. C., and secure a forty-acre site there, the outfit to cost the company £130,000.

THE Tasmania mine is a good example of the continuity and permanence of a gold mine. It has been a producer for twenty-one years, yielding \$7,891,500 in gold. The deepest level is 710 feet; there are 100 stamps; the average assay is \$20 per ton, worked by chlorination.

FOR use in high altitudes air compressors are made larger than for coast use. The Rand, South Africa, gold fields are about 5000 feet above sea level, and air compressors in use there are mostly 25 per cent larger than they would need to be on the ocean level.

THE Denver, Colo., Mining Record says that the determination of the Portland Co. at Victor, Colo., to case their main shaft with steel instead of timber, marks a new era in deep mining operations in Colorado. Structural steel sets are used and filled with 3-inch plank lagging.

THE gold production of the Rand, South Africa, district by months for the first nine months of '98 is as follows: January, 313,826 ounces; February, 297,975; March, 325,907; April, 335,-

125; May, 344,160; June, 344,670; July, 359,343; August, 376,911; September, 384,080; total, 3,081,997 ounces.

WHILE there is a "pocket region" in Tuolumne county, Cal., in the mineral slates that traverse and bisect the lime belt on the western slope of Bald mountain, yet it would be unjust to that county to ignore the fact that from the Stanislaus to the Tuolumne river are rich gold-producing mines of depth.

WHERE a customer requests a merchant to give credit to a friend, saying that if the friend does not pay he will, no legal liability is caused. Any verbal promise to pay the debt of another is within the statutes of frauds and covers no liability whatever. A suretyship to be binding must be in writing.

COMMON salt is a great preservative of wood. There is a stretch of railway track twelve miles long between Wadsworth, Nev., and Ogden, Utah, laid on bottom land on the edge of the great Salt Lake. The ground is soft, and there is a good deal of salt in it. The ties there are as bright and fresh as when they came out of the tree twenty-nine years ago.

By a new order, which goes into effect November 15, the Canadian Government has rescinded the order whereby free miners in Canada could obtain relief from forfeiture owing to the lapse of their certificates by making the proper affidavits and remitting \$5 to the Minister of Mines, always providing that the claims had not in the meantime been restaked.

ONE good way to find the required diameter of pump plungers to pump a given quantity of water at 100 feet piston speed per minute is to divide the number of gallons by 4; the square root of the quotient is the required diameter in inches. This applies only to single double-acting pumps; for duplex double-acting pumps, divide the number of gallons by 8 instead of 4.

THE bottom of the 4900-foot shaft of the Calumet & Hecla copper mine is one-half a mile below the deepest portion of the bed of Lake Superior, and nearly three-fourths of a mile below the level of the ocean. The lowest slopes and levels of several California gold mines are below ocean level; and in one case, on the southern California coast, there are five productive oil wells under the sea.

THE miners of Baranof Island, Alaska, have organized the Sitka mining district and adopted a long list of mining laws. Among the changes made by the new laws is the reduction of the recording fee to \$1.50 and the important provision that assessment work must include tunnel work, claiming that tunnel work is absolutely necessary before the claims so show up that capital will become interested.

ON the 29th ult. the large skip at the Red Jacket shaft of the Calumet & Hecla mine was hoisted to the top of the shaft, when the rope broke and the skip fell to the bottom, a distance of 4900 feet. The engineer had raised the skip too high and this pulled the rope out of the socket. The skip was empty. When a similar accident occurred at the same shaft four years ago, ten men were in the skip and were killed.

W. GULEWITSCH describes a method for the recovery of osmium from residues and gives details for the extraction of the metal by reduction with zinc and the conversion into osmium tetroxide by heating in oxygen. If there is much organic substance present the residuum is first distilled with aqua regia; the distillate is then reduced with zinc and the separated osmium converted into osmium tetroxide.

IT were better to have one developed mining claim than attempt to hold half a dozen, scratching "to keep up annual assessment work." Six hundred by fifteen hundred feet is about as much mining ground as can well be developed by any individual, and the probabilities of a sale are much better in the latter case than of a group of locations that have just enough done on them to keep them from being relocated.

THE "Sulman process" is based primarily on the MacArthur-Forrest cyanide process, its gist being in disbelief in the necessity of oxygenation. The Sulman process proposes to utilize bromide of cyanogen, and, by the addition of this to cyanide solution, secure rapidity of operation. Slimes are treated by adding soap solution, stirring and clotting the soap with lime, the effect being to reduce the mud to a flocculent, granular mass.

THE California Mineral Land bill will come up again next winter. With the exception of Stewart of Nevada, all the U. S. Senators who opposed it have been relegated to private life. In the House the Speaker says he favors the bill. The Commissioner of the General Land Office reports that the total of the lands within the granted and indemnity limits in California which would be affected by this bill (H. R. 3855) aggregates 13,679,602.29 acres.

AN arrastra will do good work on a small scale in a slow way and is better than nothing where the amount of ore or local circumstances will not admit of better machinery. It is no good for low grade ore. The iron work would cost about \$200, and could be put together and the whole thing built on the spot. A 5-stamp mill complete will weigh from six to nine tons, according to the weight of stamps. A 5-stamp mill, with 1000-pound stamps, would need 10 H. P.

AT the Golden Jubilee Mining Exposition in San Francisco last January many visitors would have been pleased to see the complete operation of mining and milling gold ore, and such a showing would be of great interest at any such gathering. At the Paris Exposition in 1900 the American State or Territory making such a display would attract considerable attention to its mines, and any manufacturer of mining machinery who would operate so comparatively inexpensive a plan would find it a big advertisement.

WHEN a painter runs across a color that he doesn't know the name of he calls it drab; so when a miner strikes a rock that is too much for him he usually calls it porphyry and lets it go at that. Such "porphyry" is, in most instances, simply country rock or dikes altered by hot water, which took out some elements and replaced them by others. It is considered a good sign of permanence, because it indicates that there was sufficient mineral action continued over a long enough period to produce a permanent ledge.

THE iodine which holds the gold of the ocean comes from the iodate of calcium. The amount of free iodine is not great in the ocean, but it is constantly being liberated by the iodate of calcium. As soon as this comes in contact with dead organic matter it becomes decomposed, and the iodine is formed. The amount of iodate of calcium in the ocean has been computed at 5,000,000 tons. This gives an enormous quantity of iodine in one form, and wherever free iodine is found there gold is held in solution in infinitesimal quantity.

THE following is a simple test for gold which may fill the requirements: For gold in oxidized ores, pulverize and place in a porcelain lined vessel or tea cup, cover with iodine and allow it to stand for two or three hours. Then dip into it a

piece of white filter paper, dry and burn it, and if it gives a purple color, gold is present, and the deeper the purple the richer the ore. For other ores with this test, such as pyrites, the ore must be roasted; where lime is present, the ore must be roasted twice, the second time adding carbonate of ammonia. After roasting, test as with oxidized ores.

"PROSPECTIVE purchasers of mining property have a right to rely on the statements made them by the owners as to the presence of extensive beds of ore at the bottom of certain pits and trenches, and are not called upon to go into them and determine the truth by dipping out the water or digging out the earth with which they are partially filled," says the United States Circuit Court of Appeals in the case of Green vs. Turner (86 Federal Reporter, 837); but any such "prospective purchaser" who would fail to verify any statement made by the vendor, so far as possible, would deserve disappointment and resultant loss.

TO FIND the necessary diameter of the bolts required to secure the cap at the crank pin end of a connecting rod suitable for an engine with a cylinder 4 in. diam., initial steam pressure 121 lbs. per sq. in. of piston: The area of the piston being 12.56 sq. in., its total load will be 1519.76 lbs.; two-thirds of this is 1013.17 lbs.; it is this amount of pull that each bolt has to resist. The normal working stress allowed to the sq. in. is 5000 lbs., so that the bottom of the thread must have an area of section of .2026 sq. in. This area indicates that two bolts, each ¾ in. diam., will be required to hold the cap to the crank pin end of the connecting rod.

TIME was in Colorado when if a mine owner recorded a lease in the office of the clerk and recorder of the county in which the mine was located, and posted notice of the same at the mine, he could safely calculate that no lien for debts of the lessor would be against his property; but that law was repealed. The mine owner's only protection is to be careful that he leases his mine to responsible men, with the provision that the lease is forfeited as soon as the lessee fails to meet his liabilities promptly. If the mine owner does not make this stipulation, he may be made pay for it. In California there is an express statute covering such cases.

THIS week the long case of M. W. Fox vs. the Hale & Norcross Co. received another advance in its final exit, the defendants announcing their readiness to pay the amount awarded, which, with interest, amounts to about \$300,000, the court ordering that the money be deposited by the receiver with the Union Trust Co., to be held subject to the order of the receiver and the court. The attorney who represented Fox will receive 25 per cent of the judgment at once, but there is a possibility of another legal battle over the remaining 75 per cent, the rival sets of directors having different views as to the disposition of the money.

IN Montana, Michigan and Arizona is the most present mining activity in copper. At Houghton, Mich., are reported 650 men at work around the Arcadian copper mine; 1500 feet of shafts and drifts are being monthly made; 200 men are at work on the stamp mill, eight miles distant, and 300 men making the eight-mile railroad; \$150,000 worth of new machinery has been ordered. The Calumet has over 4000 men on its payroll, the Tamarack nearly 2000 and the Osceola is expected to have 2000 a year hence. The total number of men employed on the 1st of last month was stated to be, in all the copper mines, 10,500, as against half that number five years ago.

LIEUT.-GOV.-ELECT NEFF, president California State Miners' Association, will call the 1898 convention to order on the 21st inst. It would be a good idea this time to elect the officers on the morning of the second day of the session. But one name is talked of for president—that of the honored present incumbent, "Jake" Neff, who if elected president of the United States would still be plain "Jake Neff" to the miners of California. Julian Sonntag declines to be considered for the office of secretary again. The names of J. J. Crawford of El Dorado and E. H. Benjamin of Alameda are mentioned in connection with that office. In many respects it is or could be made the most important position in the organization. The usual rates of 1½ fare for the round trip has been secured for attending delegates.

AT the recent International Miners' Congress held in Vienna there were represented 810,000 miners, the larger proportion being British. The congress adopted a resolution urging that endeavor should be made to secure a legal eight hours day, and that it should be extended to surface workers. All the countries represented voted for the resolution except Great Britain. A resolution demanding legislation rendering employers liable for all accidents to workmen, and declaring that no measures should be approved making it possible to evade responsibility by mutual agreement, was adopted unanimously. The congress adopted a resolution submitted by the Miners' Federation declaring the congress to be of opinion that the time had come for miners to fix a minimum wage, and, if necessary, to fight for it. The congress rejected, by votes representing 715,000 against 65,000, a motion favoring the regulation of the output of coal by international agreement. Most of the speakers declared the question to be beyond all discussion.

IN the Black Hills, South Dakota, district in the principal gold mills two kinds of single discharge mortars are used, each consisting of one solid casting, the bottom and sides so thick as not to need any lining, thickness decreasing as the feed is approached; outside walls vertical, with the exception of the discharge, which projects. The top is closed by two pieces of 2-inch plank, which rests on lugs ¾-inch wide, cast in the mortar, 2 inches below the top. These planks have each five semi-circular recesses which, when placed together, form holes for the passage of the stems. In addition to these five large holes, two smaller ones are bored for the 1-inch water-supply pipes, placed between stamps 1 and 2 and 4 and 5. Two mortars are placed close together, as the stamps of both are set in motion by one cam-shaft. To reach the mortars, etc., a passageway is left between every two pairs of batteries. The water supply is derived from a 3-inch main, running along the front of the batteries. From it passes upward a 2-inch pipe between each pair of batteries. With this is connected a 2-inch horizontal pipe, from which four 1-inch pipes branch off at right angles, two for each mortar. In addition to this water supply, there is a 1-inch pipe at each passageway, close to the mortar, coming from 3-inch main. A hose is attached to clean the apron-plates, and for other purposes. The points of difference between the two mortars lie in the inside dimensions of the lower part of the mortar and in the arrangement and number of the inside amalgamated copper plates.

Mining Conditions in Alaska.

Written for the MINING AND SCIENTIFIC PRESS by "ALEX QUARTZ."

To the people in the outside world the mining industry in Alaska and the Northwest Territory is seemingly on the decline. To those interested in the industry there, it is only now entering upon a successful and prosperous era. In the face of the fact that up to date this territory has produced for '98 over \$12,000,000, still hundreds of disappointed fortune hunters have returned denouncing the country and its leading people, who are interested in mining. Now, let us see who those disappointed men are and what they have done to prove to their own satisfaction and the satisfaction of the public in general that the country and its people who are interested in the mining industry merit such denunciation.

We find by a close canvass that the great majority of those people are men who have no practical knowledge of mining and consequently incompetent to pass judgment on the mineral resources of the country. We find also that the greater number of them are victims of either some grasping transportation company who misled them by mythical stories of rich strikes in new fields, or they have believed all of the exaggerated stories of successful "tenderfeet" who struck it rich in Klondike last year, which were circulated so freely over a year ago all over the continent. Those deluded people, not having the necessary knowledge of mining, actually believed that all they had to do was to go to Alaska or the Klondike and take up a claim and dig out a fortune in a short time with but little labor or expense. Numbers of them mortgaged their homes and spent the last dollar they possessed to reach the "Golden Klondike," only to find disappointment and ruins of their golden air castle staring them in the face. Discouraged and disgusted with themselves for having rushed blindly into the country to pursue a calling entirely new to them and when they found that their chances were few to win the golden reward they expected, they returned disgusted and empty-handed, denouncing the country and its people as boomers and liars.

But this is only the history of all other great mining excitements repeating itself, and the proportionate number of failures are no greater than they have been in other great excitements in the past, and, in fact, the number of failures in proportion to those who have succeeded are not so large as they were at the San Juan excitement a few years ago. There has been a popular idea among the "tenderfeet" that it did not require experience to mine successfully in Alaska, but they have found out to their sorrow the falsity of this belief. However, no matter how much the country may be "blackeyed" by the unsuccessful, the gold the country produces will speak for itself and the people will continue to come and development will progress rapidly, and in a few years Alaska will be one of the greatest gold producers, if not the greatest, in the world, for the gold is there and the people will find ways and means of getting it. Although it is true that a large amount of money has been taken into the country, still there was no gold dust imported, and when we count the gold in its native state that is shipped out of the country no one will deny the fact that Alaska and the Northwest Territory have produced it.

The Northwest Territory, it is true, is experiencing a "standstill" or decline period at the present, but it is not from the lack of gold in its mines, but from the excessive royalty exacted by the Government and the stringent laws by which the miners have to abide, and their inability under such conditions to make their claims yield a profit there, where the same claims would yield a fortune in a short time were they on American soil. All of the camps on the Yukon in Alaska were reported to have a promising outlook for the coming year when we left St. Michaels on Oct. 9th. The discoveries made in the coast country north and east of St. Michaels last winter, viz., Auvik and Golovin bay, are fast coming into prominence and will be in the next two years to come the chief attraction in Alaska. The Auvik country, which I gave a history in brief of in my letter of last July, is within the 100-mile limit of the military reservation of Fort St. Michaels and consequently could not be prospected or worked until the authorities at Washington had decided upon the matter and granted permits to pursue mining within the reserve. A short time previous to my leaving St. Michaels I received from Washington, through the commanding officer at St. Michaels, an order permitting myself and associates to mine on that portion of the reservation under the U. S. mining laws and the district was formally opened for the location of claims.

A few days' prospecting on "Macdonald creek" and the Auvik river in this district prior to my leaving Alaska proved to the satisfaction of many of us interested that the district is going to turn out even better than any of us had expected. The average of the colors found in the gravel laying on bedrock weighs over a pennyweight each and from the small patch of bedrock worked on "Macdonald creek" it was proven that the main part of pay will be in the form of nuggets. The assay value of the gold is the highest of any ever found in Alaska or the Northwest Territory, being worth \$19.50 per ounce. Consider-

able prospecting work will be done there this winter and a large number of claims will be opened there next spring. It is the ideal placer mining country of Alaska for many reasons. The river and all of its tributaries have a great deal of fall, affording a good dump for sluices. The mountains are high and steep, giving a good watershed into all creeks and ravines. Ample timber for fuel, lumber and all mining purposes is at hand. The distance from a landing on the coast being only thirty-five miles, makes it possible to get all kinds of supplies and machinery to the mines easily and cheaply, by pack train of horses in summer and by sleighs in winter. Like all of the coast streams south of Port Clarence, the waters in the channels of the creeks and rivers never freeze in winter, consequently there is no frozen ground to contend with, and as soon as the waters subside sufficiently after they break up the latter part of May, work can be carried on there without interruption until the last of September. During June, July and August two shifts of men can be worked night and day, as it is continual daylight, thus making a working season of six months instead of three.

Although there has been some warm and hot springs discovered in this coast country laying between the mouth of the Yukon and Port Clarence, no one yet has been able to advance a feasible theory why the waters in all of those coast streams never freeze underneath in winter, but it is nevertheless a fact that any creek flowing 50 miner's inches of water after the first frost in the fall, contains running water the whole winter through. I have myself cut and dug shafts in creeks through ice 6 and 8 feet thick in midwinter, to find running water and loose gravel underneath, still a close search failed to disclose any warm or hot springs in or flowing into the same creek.

The formation in the Golsan mining district on the Auvik is composed of black slate, porphyry, diorite and granite, all of which are densely mineralized except the granite. This is bordered on the north by a large dike several miles in width, of recent slate or what is commonly known as "coal slate." The distance from St. Michaels to the junction of Macdonald creek and the Auvik, the headquarters of the district, is about seventy-five or eighty miles, forty of which is by water or sea ice to Golsova, a native village on the coast, and thence thirty-five miles over three low ranges of mountains to the Auvik. This new country will in the future figure prominently in the gold production of Alaska.

What is known as the Golovin Bay country will take an important place next year in the leading gold producing sections of Alaska. It is situated on the Neukluk river, a tributary of Fish river, which empties its waters into Golovin bay. It is between sixty and seventy miles in a northerly direction from Cheenik, where Dexter's trading station and the Swedish Mission are located, and about 160 miles from St. Michaels. The route to the mines in summer is an all-water route: from St. Michaels to Cheenik by steamer or sailing vessel, and thence up the river to the mines by flat-bottomed wooden boats or native skin boats. But this season a small river steamer, 75 feet in length, succeeded in getting up the Neukluk river to within six or seven miles of the new town, Council City, which is situated near the center of the mining districts. The details of the discovery of this district last winter by Messrs. Blake, Libby, Melsing and Moredaunt was given in my letter of last July, and the reader is already familiar with them, so it is not necessary to repeat them; suffice to say that, although it had no "standstill" period like the Golsan district, it had its "backsets." It is situated some forty miles outside of the limits of the military reservation, but, unfortunately, the first rush of men who went there were novices, and, it being early in the season, the waters still high and the mosquitoes bad, they were easily discouraged when they could not get "gold by the shovelful," as one of them remarked. They returned to St. Michael and "blackeyed" the district. But, however, further developments proved its richness, and later on, when it was learned for a fact that the discoverers were panning out of Ophir creek as high as two ounces per day, the second pilgrimage was made, and since that time people have continued to come in, and when I left there on Sept. 10th there was a population of about 300 people, and substantial log buildings were fast taking the place of tents.

Council City is situated on the east bank of the Neukluk river, on the boundary line between Discovery and El Dorado districts, and between Melsing and Ophir creeks, the two first creeks discovered. No development has been done on Melsing creek so far to demonstrate how rich it is or what it will pay, all attention being paid to Ophir creek by the very few who thoroughly prospected their claims and did work enough to demonstrate what their claims will pay. Everybody coming into the new field was seemingly satisfied by seeing what those few were getting who were thoroughly prospecting their claims, and put in all of their time hunting up new creeks and staking claims, while the balance were building houses in Council City for winter quarters, as the season was nearing the close when most of them arrived.

To be brief, one claim proven, seven miles up Ophir creek, will pay at the least, in one place, \$300 per day

to the man shoveling into sluice boxes, and another claim down near the mouth pays two ounces per day to the man by the panning process, and it is taken for granted that all the claims lying in between are equally as good. In a small creek, a tributary of Ophir creek, an ounce per day to the man was taken out with a rocker from the gravel on the rimrock, without going to bedrock. On another claim, on another small tributary of Ophir, a daily average of over four ounces per day was taken out with a rocker for a couple of weeks prior to shutting down for the season. This I have seen done, but I do not know nor will I vouch for the richness of other claims on the same creeks, but it is natural to suppose that they are also good. The formation throughout the whole district is laminated black slate, intersected by frozen seams or veins of quartz, mica schist and talc. About 50 per cent of the gravel in the creeks is quartz from those seams and large ledges of quartz that run through the country.

The formation in this section, like the Auvik and all along the coast, lays very flat, averaging a dip of 15°. Large dikes of slate, carrying free gold, run through those districts, some of it (selected pieces) running as high as \$20 per ton, mortar tests. Those dikes and gigantic quartz ledges which I have seen of low grade ore convinces me that at no distant date this section will be one of the greatest milling districts on the continent. There is a vast scope of country lying between the Unalakleet river and Golovin bay, intersected by rivers and streams, in which gold has been found, which may on more thorough prospecting develop even better and richer districts than those already named. Ophir creek and the Upper Neukluk have one serious drawback, that is the lack of timber. The timber ends about a mile above Council City, and from there to the Port Clarence divide, at the head of the Neukluk, there is not a tree to be seen.

From the present outlook, this coast section is the coming country, for the reason that it is easy of access and has all the facilities for successful mining on a large scale. Still, I would not advise anyone to go there, good as the outlook is, for the reason that there are hardships to be endured and a great many slight drawbacks, that are too numerous to mention here, which would serve to discourage people unused to that climate. It is no place for a man who is not a practical miner, in good, sound health, and even they are liable to fail. The popular idea of luck, without practical knowledge of mining, which the majority of the "tenderfeet" preach, is all bosh. That is the very reason why the newly-discovered districts are so retarded in development, and the cause of so many hard-luck stories of those who came back cursing the country. It is all summed up in a few words: The lack of practical miners and prospectors and too many novices and speculators whose only capital is "wind." I would warn all who are not practical miners and who do not possess ample capital to work on to stay away from Alaska and stick to their old vocations as long as they insure them a comfortable living. In conclusion, I will say I have met a large number of Kotzebue Sound victims, and many of them were old California prospectors and miners, who, after prospecting on the Kowak, Noatak and Seeliwik, all agree on one point, and that is that gold does not exist in paying quantities in that section. Several of them have told me that there is not a color of gold to be found on the Noatak and Seeliwik rivers, and the "banner nugget" that was found on the Kowak this season was not as large as the head of a pin. About 700 people have already left there, and it is reported that the balance—some 700 more—will be out the first chance in the spring, if nothing is found there during the winter. Golovin bay has already got a good many of those victims, and likely will have many more before spring. There have been contracts let for a monthly mail this winter to St. Michaels, via Dawson, Circle and Rampart City, and the first official winter mail that ever left St. Michaels for the upper Yukon country left St. Michaels on Oct. 9th, carried by Edwin Engelstad, the veteran Alaskan traveler, who has the contract.

A GERMAN inventor is reported to have discovered a method of producing glass which will transmit light freely, but no heat. A plate of the material $\frac{1}{16}$ inch thick, containing 28 per cent of iron in the form described as ferrous chloride, allowed only 4.06 per cent of radiant heat to pass through it, while another plate of equal thickness, and containing quite as much iron in the shape of ferric chloride, permitted 11.2 per cent to pass. The chemical distinction is very small, but the effect is said to be marked. A thinner slab of this glass allowed less than 1 per cent of the heat of gas flames to pass, although transmitting 12 per cent of heat from sunlight. Ordinary window glass, on the other hand, lets 86 per cent of the heat through.

In New York the decision of the United States Court of Appeals in favor of the Mitis patent for use of aluminum in the manufacture of steel ingots and castings is considered the most important one affecting steel manufacturing rendered in many years. It means that every maker of steel, ingot or casting, must pay a royalty or cease to use this process. The use of aluminum in the manufacture of steel has made possible many later improvements.

The Present Conditions of Gold Mining in the Kochkara Region in the Oural.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by R. HELMHACKER, Prague, Bohemia.

The inclusions of pyrites, from which the arsenopyrite prevails mostly, also either pyrite or arsenopyrite alone, or both jointly, with rare chalcopryite and more sparingly galenite, form sometimes 5 to 10 per cent, and on some spots yet more of the vein matter. The arsenopyrite alone, or both the mixtures of pyrite with arsenopyrite, contain from 40 to more than 400 gr., chemically bound, therefore no free milling gold in one ton sulphureted ore, so that the veins in the depth have a higher grade than when the bulk of auriferous sulphurets in them increase. The auriferous sulphureted ore is also disseminated in slighter quantities in the outside of the vein walls in the lode rock, or penetrates fragmentary portions of silicified lodestone, or even granite, which, at such depth, is only partially decayed. The veins are developed with shafts to the depth of 140 m.; the free milling gold, or the metal in the condition suitable for washing and amalgamation, begins to decrease much below the depth of 20 to 50 m., where it is slowly replaced by auriferous chalcodony and auriferous sulphureted ores. The fineness of the gold ranges low, as the bullion contains about 30% Ag., but in the cellular, friable veins, more contiguous with the outcrop, the free Au has a lesser percentage of Ag.

The mining work is done simply: from the shafts are driven levels which tap commonly much water, as the ground is very permeable. As the country, already alluded to, has only few forests, and the firewood, transported from formidable distances, is becoming more costly, steam engines are run only for dressing and pumping purposes; hoisting is executed with horse-whims. The mining operations underground and stoping are done mostly by Russian miners, while the conveyors, and the unskilled labor above ground, are Bashkires. The wages vary per day from 30 to 42 cents. As it is hoped that a railway will connect the Kochkar mining region with the Oural trunk line, the firewood may be replaced by waste from naphtha refining, and by this means one could run more steam engines, being provided with a cheaper fuel. As yet, the firewood can be replaced only by some mines with peat, whose moderate deposits are distant about 10 km. from them.

Not far distant from the Kochkar mining region, at Cheliabinsk, were found lately quartz veins in the same great granite massive, occurring under similar conditions, but they differ from the veins described in that they are extremely fluctuating in their gold yield, which is, in the former region, more constant and less varying.

The secondary gold deposits are now less productive than when discovered half a century ago. The gold detritus formed by the disintegration and crumbling away of the rocks which contain the auriferous veins has not been deposited far from the place of its formation. Therefore they are alluvial and connected with the outcrops of the auriferous veins, immediately beneath them, as these species of secondary accumulations extend only to such distance as the veins pass below them, and thus are blended at their bottoms with the decayed heads of the gold vein-bearing rock. Placers extending over a larger ground area along the water courses, furrowing the country, and that have been partly removed, have their rich portions corresponding also with high-grade gold tenor, arranged transversely to their trend, resting over the outcrops of the veins. The alluvial placers show beneath a thin vegetable soil a barren alluvial bed of tenacious, variegated clay to a depth varying from 4 to 12½ m., and below them the auriferous layer ½ to 1½ m. thick. The alluvial gold-bearing layer is composed of coarse argillaceous sands, including edged fragments of vein quartz and rounded fragments of granite, containing in its lower division 1½ to 10 gr. Au. in one ton of gravel. But the lower division of the gold-bearing bed is blended on its bottom with the uppermost, entirely decomposed heads of granite forming their base, in which the same gold yield is detectable, and therefore they were dug, together with the alluvial bed, and washed. The quartz fragments from the disintegrated veins of adhering gold, arranged in rows on the underground outcrop of the lodes, naturally led to the discovery of the primary gold deposits. Evidently the alluvial bed of detrital gold was generated from the auriferous sulphurets, decomposed by exposure to air and weather agencies, which thus set free the fine or granular gold. The gold tenor of all the gold sands washed in the last year in this mining region afforded an average output of 1½ gr. Au. to the ton of gravel.

In spite of the atmospheric agencies decaying the granite, some minerals in it, like the liberated gold, remain unaffected, and are washed with the detrital gold in the placers situated on the brooks Kamenka, Tioplaia and Sanarka. These placers are renowned for the occurrence of precious stones, such as beryl, cyanite, pink topaz, corundum, ruby, sapphire, amethyst, transparent quartz, zircon, etc.

In regard to the age of the above-mentioned alluvial gold layer, the beds have been referred to as of recent origin, partly to the Postpliocene period,

as the remains of the elephant, rhinoceros and horse have been found in them.

The extraction expenses for one ton of savings are \$3.07; the ores must therefore contain 9.1 gr. of Au in one ton to justify mining exploration. Effectively the yield in gold is greater than this minimum limit, and the veins gave after they were discovered and worked good returns of free-milling gold. The turbid mud of the stamped ores is concentrated either on shaking tables (Rittinger's percussion plane) or led over amalgamated copper plates or over sluices covered with blankets; to take up and secure the fine gold, quicksilver was introduced in the stamp or panning mills, where the latter are used. About 1870 the mines were down to the depth of 28 to 40 m., and tests of the savings showed high grade ore. By the washing and amalgamation operation little of it was caught, and therefore in the waste heaped on dumps was gold chemically bound or in a condition not suitable to amalgamation, which time would make free milling, and the finely divided sulphureted ores and the chalcodony would be entirely decomposed by atmospheric agencies. For gold extraction there were erected since the year 1872 stamp mills which dressed the turbid water with free milling gold, as already alluded to, in shaking planes and by amalgamation; but as the quartz veins in partly decomposed condition and the gold-yielding country were friable, instead of the crushing operation in stamp mills, there were in the year 1894 erected Chilian arrastras, better adapted for this purpose of crushing and milling, so that the dressing and concentrating were done in forty-nine mills, viz: in five stamp mills with only nine batteries, and in forty-four other dressing mills with 110 pairs of Chilian mullers (arrastras), each pair of arrastras milling daily ten tons of savings. Since the year 1890 there were also placed in the mills percussion tables, Hungarian amalgamating pans and Frue vanners, but only six milling establishments dressed the sulphureted ores to concentrates in the vanners, while the others heaped the slimes or tailings resisting the mechanical mill-treating methods for gold catching on refuse dumps. To dress the vein stuff, on some greater mines were erected dressing mills. One of the largest presents a three-story building with three compartments: the crushing and concentrating, the ore roasting and the lixiviating.

(To be Continued.)

In the Days of '49.

TO THE EDITOR:—I notice your description of the Granite Hill mine, one-half mile east of Wolf creek, Grass Valley. In September, '49, I was one of a company of ten who camped on Wolf creek, and gave it that name. The circumstances in connection with the naming of this creek are as follows:

We ten arrived at the head of the little creek some time in September, '49, and camped, turning our cattle out to graze on that little valley. Having subsisted on three crackers each, a few dried apples and a little coffee for seven days previous, we became wolfish. Finding nothing for sale there to eat (and if we had found it we were about 40 cents short of any kind of change), we concluded to kill one of our faithful animals that had toiled so hard and patiently in the yoke to land us there. We had but one animal that looked as if he had fat enough on his bones to grease a gimlet. His name was "Dan Rice" because of his cuteness and funny tricks. We named him after that great Pennsylvania showman and joker. Perhaps not one animal in ten thousand that made that wonderful trip across the American desert arrived in as good condition to feed ten almost starved men as did Dan. We prepared to kill him. It was a solemn task and many tears were shed. We drew lots as to who should commit the terrible deed. It was done, and the hide, head and entrails were left on the bank of the creek below our camp. Nearly all through that night from the noise they made we thought there were about a thousand wolves fighting and howling over the remains of Dan.

So we named the creek Wolf creek, and so it remains. From there we went over and camped on Gold run; prospected there, but did not dive deep enough, consequently lost the chance of claims that yielded from \$100,000 to \$300,000 every 60 feet. So you see such was life in the most wonderful gold country the world ever knew. In the spring of '50 two men by the name of Walker built a sawmill and two houses on Wolf creek near the site of our old camp, each of them having a family. They finished up the mill and houses in the evening and intended to start in the morning down to the valley close to Sacramento after their families. The Indians came that night and killed both men and burned the mill and houses. In the morning some runners came over to Nevada City and told the news. A drummer and fifer were secured, who paraded the streets, and Capt. Tom Hocket (Oregon Tom) called for volunteers to hunt the Indians down. One hundred of us volunteered, and by noon we were on their trail. About fifty miles southeast of Grass Valley we began to see them skulking through the timber, from tree to tree. I don't know how many were killed, but all seemed satisfied that the murder of the Walkers was amply avenged.

The Refining of Base Lead Bullion Containing Silver, and High in Gold.*

NUMBER II.

By G. H. BLAKEMORE.

The Desilverization of Softened Lead.—When the lead in the softening furnace has cooled sufficiently the tap hole is opened and the lead run into a so-called ten-ton (it really holds fourteen tons) desilverizing kettle. The stream of black-red lead falling into the kettle forms a considerable amount of dross or litharge. This cannot well be prevented. It is skimmed off and returned to the softening furnace. Sometimes as much as 700 pounds of it will form. To get all the copper out that is possible, the contents of the kettle are allowed to cool down, until the charge begins to "ring" at the edges, that is, to solidify. Most of the remaining copper will then rise to the top. This is skimmed off and returned to the next charge of the softening furnace.

Assays of this copper dross per ton are as follows:

| Silver, Ozs. | Gold, Ozs. | Copper, % |
|--------------|------------|-----------|
| 143.38 | 87.36 | 2.20 |
| 280.33 | 88.49 | 3.10 |
| 161.64 | 77.06 | 2.30 |
| 231.37 | 76.94 | 3.60 |
| 131.67 | 52.63 | 2.30 |
| 182.39 | 62.65 | 10.20 |
| 145.51 | 49.04 | 3.80 |
| 247.82 | 105.08 | 9.40 |

Assuming that the kettle full of softened bullion has had to be cooled back to allow the second copper dross to rise and be skimmed off, and that it has been heated up to the melting point of zinc, the kettle is now ready for the zinc charge, determined according to the assay of the bullion dip, which should have been taken from the softening furnace to save time.

The following instances will show exactly what zinc was required for the following charges:

| Net tons in kettle. | Assay per ton. | | First zinc, lbs. | Assay after. | | 2nd zinc, lbs. | Assay after. | | Third zinc, lbs. | Assay after Ag. |
|---------------------|----------------|-------|------------------|--------------|------|----------------|--------------|-----|------------------|-----------------|
| | Ag. | Au. | | Ag. | Au. | | Ag. | Au. | | |
| 11.01 | 195.48 | 16.52 | 630 | 1.81 | nil | 86 | nil | nil | | |
| 11.15 | 151.71 | 15.98 | 542 | 6.52 | nil | 106 | nil | nil | | |
| 10.49 | 118.88 | 13.12 | 495 | 19.80 | .008 | 161 | tr. | tr. | | |
| 9.78 | 159.90 | 14.00 | 416 | 13.53 | tr. | 123 | .10 | tr. | | |
| 11.22 | 111.30 | 15.00 | 517 | 7.92 | tr. | 112 | nil | nil | | |
| 11.05 | 246.38 | 24.04 | 651 | 9.26 | tr. | 116 | nil | nil | | |
| 10.04 | 311.10 | 49.42 | 863 | 10.04 | nil | 115 | nil | nil | | |
| 10.98 | 219.94 | 31.32 | 727 | 8.24 | nil | 112 | .11 | tr. | | |
| 9.80 | 186.22 | 34.70 | 638 | 5.14 | nil | 98 | nil | nil | | |
| 9.76 | 177.90 | 23.72 | 601 | 14.71 | tr. | 125 | 2.01 | tr. | 65 | nil |
| 10.47 | 340.04 | 37.38 | 887 | 14.26 | tr. | 127 | nil | nil | | |
| 11.38 | 111.34 | 15.00 | 517 | 0.94 | tr. | 112 | nil | nil | | |
| 11.38 | 31.33 | 0.31 | 55 | 13.23 | nil | 117 | nil | nil | 50 | nil |
| 10.87 | 81.22 | 6.51 | 129 | 69.27 | .008 | 205 | 6.48 | nil | 259 | 0.21 |

As soon as the assay of the bullion is known the zinc table is consulted and the proper charge of zinc weighed up and melted into the lead in the kettle. This is then either hand stirred or steam stirred. If the former, a perforated circular skimmer, with a handle of three-quarter round iron ending in an "eye" or loop, is used for this operation. The workman holds the "eye" of the handle in both hands and squarely faces the kettle. He then slides the skimmer, edgewise, into the lead, turns it face up and, using the edge of the kettle as a fulcrum, he presses down on the handle, steadily at the commencement of the stroke, and ending with a jerk, so bringing the face of the skimmer to the surface with a splash. He draws the skimmer towards him on the surface of the lead, turns it edgewise to push it to the bottom of the kettle, and so renews his stroke. Two men work opposite each other and they first make the lead revolve one way and then, by changing the direction of the stroke, make the current change the other way once every five minutes. This stirring is kept up for from thirty to forty-five minutes. Easy as it may seem, there is considerable knack in stirring a kettle of lead. The paddle, or stirrer, keeps traveling away, and a "new chum" at stirring may be easily recognized, as he cannot stir and stand in the one spot. The work is laborious while it lasts, and although steam is effective in stirring if looked after, and labor saving in a large plant, nothing is saved by it in a small plant, because the men are required later on in the work for the moulding of the soft lead. With steam stirring care must be taken that the lead is not too cold, for if it is the zinc crust is much lower in silver and gold than it should be; if too hot, i. e., visibly red, a certain amount of the zinc added is rendered useless by oxidation. With ordinary care steam stirring is good under the precautions stated. After the zinc is well stirred in the kettle is allowed to cool down for some three hours. The skimming which in that time has risen to the top contains usually all the gold and a considerable part of the silver (see the table of results given above). After the first lot of skimming, or "crust," as it is called, is taken off, the fire is started to warm up the lead. A chisel-pointed scraper, some 4 inches wide at the edge, is then pushed down the side of the kettle to detach particles of alloy which have deposited there. This rises to the top and the second skimming is taken

* Australasian Institute Mining Engineers.

off. A third skimming is also obtained by letting the kettle cool back until it "rings," i. e., solidifies along the edges. As soon as this ring gets about 3 inches wide the fire is started again under the kettle, and the heat raised so as to just melt the ring; a little more alloy is thus obtained. These skimmings or crusts are taken off by two men, one man using the skimmer and the other a wooden rabble, with which he pushes the floating crust to his mate. Some seven hours are taken to complete the first zincing, counting from the time the zinc is melted in until the last skimming is off.

As soon as the lead is skimmed clean a sample is taken large enough for ten French assay tons. This is assayed immediately by the assayer for gold and for silver. The weight figure of zinc necessary to add to extract the balance of the silver left in the lead is sent down by the assayer, who keeps the zinc table in his charge. By the time the assay is ready the kettle of lead has been warmed up to the melting point of zinc once more, and when the second zinc is added the same process of stirring is followed and three skimmings of zinc dross taken off. The crust obtained from the second zincing is not placed with the crust obtained from the first zincing. A glance at the zinc results given above will explain why. It is apparently free from gold and very low in silver, and therefore it is put aside and added to the next charge in the kettle and called "returns." I usually count 3 pounds of the zinc used in the second zinc as equal to 1 pound of fresh zinc, and always make that allowance in the zinc required by the next charge. For instance, say a new charge in the kettle requires 600 pounds of fresh zinc and I have 99 pounds of zinc in the shape of a second zinc crust. I count this as equal to 33 pounds of zinc and put it into the kettle with 600—33 pounds = 567 pounds of new zinc to be added.

Sometimes a third zinc is necessary in case the silver in the kettle is not low enough, and, if so, the crust or skimming so obtained is placed with the second crust and both returned to the next charge. If the silver is not higher than 0.20 ounce per ton it is usually allowed to pass as clean.

Although I here speak of gold crusts and silver crusts separately, it is not the best practice to attempt to extract the gold with as little silver as possible and to produce a silver crust afterwards containing only silver. My experience is that it cannot be done when gold is present in the bullion in the amounts given in a previous table. The reason is that the gold does not all come out with the zinc; some is always left behind.

It is admittedly expensive to have to extract all the silver with the gold and so only produce dore bullion, but it is better to do that than lose a considerable amount of gold by attempting to produce a silver crust in the hope of getting a portion of the silver ready for the market without having to go to the expense of the parting operation. The examples given are instances of special attempts to extract all the gold and make a silver crust. Assays are given of the silver crusts, which in every case contained gold, although a careful assay of the bullion from which it was produced failed to show that any gold was left.

The following are instances of special attempts made to clean the lead of gold:

1. The assay of the lead before zincing was 14.78 ounces gold and 121.16 ounces silver per ton. First, gold zinc 200 pounds reduced lead to .004 Au. 108.80 Ag. per ton; second, 30 pounds reduced lead to tr. Au. 76.90 Ag. per ton; third, 10 pounds reduced lead to nil Au. 67.23 Ag. per ton.

The first silver crust from this apparently clean charge assayed 927.48 ounces silver and 0.26 ounces gold per ton.

2. Assay of lead in kettle 12.22 ounces gold and 124.22 ounces silver per ton. First, gold zinc 211 pounds reduced lead to .05 ounce Au. 119.59 ounces Ag. per ton; second, 35 pounds reduced lead to .008 ounce Au. 53.44 ounces Ag. per ton; third, 20 pounds reduced lead to nil Au. 45.28 ounces Ag. per ton.

The first assay crust assayed 421.84 ounces silver and .40 ounce gold per ton.

3. Assay of lead in kettle 15.14 ounces gold and 149.26 ounces silver per ton. First, gold zinc 193 pounds reduced lead to .03 ounce Au. 136.11 ounces Ag. per ton; second, 70 pounds reduced lead to nil Au. 44.02 ounces Ag. per ton.

The first silver crust assayed 653.80 ounces silver and 0.50 ounce gold per ton.

In addition to the above instances, the following figures are assays made of first silver crusts:

| Oz. silver per ton. | Oz. gold per ton. | Oz. silver per ton. | Oz. gold per ton. |
|---------------------|-------------------|---------------------|-------------------|
| 915.13 | 0.29 | 891.35 | 0.05 |
| 519.49 | 0.32 | 583.94 | 0.06 |
| 644.76 | 0.14 | 145.80 | nil |
| 785.38 | tr. | 534.61 | 0.21 |
| 715.77 | 0.13 | 792.29 | 0.02 |
| 102.28 | 0.06 | 510.86 | 0.04 |
| 891.35 | 0.05 | 133.18 | tr. |
| 785.38 | tr. | 573.42 | tr. |
| 715.77 | 0.13 | 156.59 | nil |
| 317.48 | tr. | | |

The amount of gold is certainly small in most instances, but as soon as the concentration processes commence the percentage of gold in the concentrated products rapidly rises.

(To be continued.)

A Spokeless Tailings Wheel.*

The comparatively level country traversed by the Main Reef series, and the enormous economic importance attaching to the secondary treatment of our ore (which takes the form of cyanidation of the sands and slime products of the gravitation stamp mill), very soon brought the question of the cheap lifting of the mill pulp preparatory to its distribution at the cyanide plant into notable prominence.

To those who have grown with the Rand industry from its humble beginnings it has been most instructive to watch the evolution of the tailings wheel as we know it to-day, and to note the steadiness with which it has distanced the plunger pump and the centrifugal pump in the favor of our mechanicians. The main lines upon which that evolution has advanced receive their best and latest exponents in the type of elevator erected at the Glen Deep and French Rand mines; a wheel of wooden and iron construction, 60 feet in diameter, with at most a double row of buckets for the elevation of the mill pulp, belt-driven by a pulley on the arms of the wheel, and the axle resting on substantial bearings supported by built-up steel A frames, and these frames designed so tall as to be braced together above the top of the wheel, and resting on masonry foundations.

The bicycle wheel suggested the design of one meritorious pattern of tailings wheel, of which that at the Consolidated Main Reef is an example. In this the spokes are constructed of rod steel on the tension principle; the original application of motive power was by toothed wheel at the periphery, but this has been replaced by a driving rope. A second tailings wheel of this type is almost finished at the Durban-Roodepoort, but it differs from that at the Consolidated Main Reef in that the usual flat bucket is replaced by a V-shaped bucket. The original design for the tension spoke wheel was made by the inventor of the new appliance, who has now, in the opinion of most of our leading mechanical engineers, struck upon an idea that is of really wide application.

The invention consists of a spokeless or armless wheel or hollow cylinder provided with the buckets which are typical of the tailings wheel in ordinary use. The wheel may be constructed of any material found most suitable, and can be of any breadth and height. Round the outer periphery of this wheel or elevator are riveted two complete parallel rings of steel rail. The wheel rests on two pairs of flanged rollers at its base, which rollers receive their motion from the motive power and rotate the elevator. Three other pairs of rollers are used—two at about the middle at opposite sides and a third pair at the top. These are intended to keep the wheel in its true path and also from collapsing. Should it be necessary to make a wheel of greater breadth, it is the intention to use a third, and even a fourth, rail with its complement of rollers.

It is proposed to mount the lower sets of rollers on shafts or axles, resting on substantial bearings, long enough to receive the motive power driving the wheel. At about three-quarters of the distance from the bottom of the wheel, or at any convenient height, a platform is supported on the framework already mentioned. This platform is provided with vertical or angular sides to form the receiving-box into which the wheel discharges the material elevated. This last is conveyed by launders or chutes to any desired point. One of the points in favor of the new appliance is that the small diameter of the driven wheels or rollers allows of full efficiency being derived from the driving ropes or belts. Under the system in vogue this is not the case, owing to the slow travel of the driving belt.

The special advantages claimed by the inventor are simplicity, cheapness, effectiveness, and capacity practically unlimited. The last advantage alone renders comparison between the two systems almost impossible; in the case of the present type of wheel, when a large quantity of material has to be raised, two or more wheels are required; while in the case of the new wheel, the material from several mills could be raised at a proportionately much smaller cost than could that from one mill—the wheel being merely so much the wider. The only necessity is dividing off the breadth of the wheel into the needful number of compartments for the separation of the products of the various mills. The normal type of wheel requires massive structures to support it, while the arms interfere with the free discharge of material both into and out of the buckets; the new wheel rests practically solely upon the two lower sets of rollers, and both the foundations and framing which carry the additional rollers bear none of the weight of either the wheel or the material to be raised. With the new wheel any sort of driving power can be employed; tooth-gearing can be applied to the periphery of the wheel, or to the friction rollers; a direct-acting engine can drive the shafts of the friction rollers, or a slow-speed motor can do so; the motive power can be supplied by rope drive—either at the wheel's periphery or to the shafts of the friction rollers.

In the design for a wheel of the new type, to handle

*Condensed from South African Mining Journal.

the products of a 200-stamp mill, the gross width of wheel (which itself weighs fifteen tons without load), standards and framing, is 5½ feet. The elevator needs only certain structural modifications to fit it as an elevator "for raising liquids or solids, or combinations of solids, and solids generally, but is specially adapted, as far as mining purposes are concerned, for raising tailings, slimes, concentrates, rock or other like matter from a given point to any desired level." The inventor is L. H. Lavenstein.

New Propositions for Good Roads.

The California good roads movement is assuming new forms. At the coming session of the Legislature a new good roads bill will be presented. It is now proposed to attack the problem of getting good roads from the side opposite to that by which it was approached before. That is to say, instead of taking the business of building the roads out of the hands of the county supervisors—a proposition which arrayed powerful opposition to the Legislature two years ago—it is now the intention to have the highways constructed by the county authorities on plans and specifications prepared by the Department of Highways. To induce the counties to build main roads in this manner a substantial inducement is to be offered—the highways so built are to be accepted and maintained by the State, the necessary sprinkling required to keep down the dust being included as a part of such maintenance.

State Maintenance.—The bill as drawn provides that no road shall be accepted by the State unless it is at least five miles in length and leads, on the best grade and alignment, from one county seat to another or between other important places. In order to maintain the accepted roads, the Department of Highways is empowered to let contracts to sprinkle, roll and otherwise care for such highways. For the first year \$100,000 of State funds is to be appropriated, and thereafter as much as may be necessary.

Half of the Money for Permanent Work.—These are the principal provisions of the State highway bill as drawn, and there are also proposed certain amendments to the county road law, the most important of which is a provision that 50 per cent of the road taxes shall be put into a "good road fund" which shall be used only for certain specified purposes, viz: the laying out, grading, draining, sprinkling, graveling or macadamizing of the principal highways of the county and the purchase of road machinery. Another amendment gives the county surveyor increased powers and constitutes him practically county engineer for road-making and maintenance purposes.

What the Highway Commission Expects.—The Highway Commissioners propose that half of all the money raised in the State annually for road purposes—an amount equaling nearly \$1,000,000—shall be expended in permanent road work according to the most modern and intelligent methods. They propose that this sum shall be used in building roads of the best material along proper grades. They propose that all superstructures, wherever possible, shall be of rock; so that once built they will last for centuries and never henceforth be of any expense to the taxpayers of the State. A high average for the best road, stone bridges, culverts and all, is \$5000 a mile. At this rate 200 miles of modern road could be built in California annually. In five years we could have 1000 miles of as good roads as there is in the world, and in twenty years we could have a network of magnificent highways connecting all of the great districts of the State with each other, and all at no increased cost to the taxpayers.

JOHN MUIR says, in this happy land no famine comes nigh the Sierra bear. All the year round his bread is sure, for some of the thousand kinds that he likes are always in season and accessible, ranged on the shelves of the mountains like stores in a pantry. From one to the other, from climate to climate, up and down he climbs, feasting on each in turn, enjoying as great variety as if he traveled to far-off countries north and south. To him, almost everything is food except granite. Every tree helps to feed him, and every bush and herb, with fruits and flowers, leaves and bark, and almost everything living or dead within reach, animals and insects—badgers, gophers, ground squirrels, lizards, snakes, etc., and ants, bees, wasps, old and young, together with their eggs and larvae, and their moss, grass, and paper nests. Craunched and hashed, down all go to this marvelous stomach, and vanish as if cast into a fire. What digestion! A sheep or wounded deer or a pig he eats warm about as quickly as a boy eats a buttered muffin; or, should the meat be a month old, it still is welcomed with tremendous relish. After so gross a meal as this, perhaps the next will be strawberries and clover, or raspberries with mushrooms and nuts, or pockery acorns and choke cherries. And, as if fearing that anything eatable in all his dominions should escape being eaten, he breaks into cabins to look after sugar, dried apples, bacon, etc.; and if still hungry, he eats the mountaineer's bed,

but when he has had a full meal of more temptingainties he usually leaves it undisturbed, though he has been known to drag it up through a hole in the roof, carry it to the foot of a tree, and lie down on it to enjoy a siesta. Eating everything, never is he himself eaten except by man, and man alone is an enemy to be feared. "Bar meat," said a hunter from whom I was seeking information, "bar meat is the best meat in the mountains; their skins make the best beds and their grease the best butter. Biscuit shortened with bar grease goes as far as beans; a man will walk all day on a couple of them biscuit."

Dissenting Opinions.

The United States Supreme Court stood five to three in their decision against the Joint Traffic Association. Justices Gray, Shiras and White voted against. Justice McKenna took no part in the decision.—Washington dispatch.

There never should be a dissenting opinion in a case before the Supreme Court of the United States, or any other high appellate court. The decision should be that of the court, and not of the judges as individuals. The judges should get together and render a decision settling the points in controversy, and the decision rendered should not reflect the opinion of this judge or that judge, but the opinion of the court. If one were a candidate for the position of teacher in the public schools, what possible good could it do to tell him, "You are elected, but three members of the board voted against you," or if he applied to a bank for a loan, to tell him that he could have it, but three of the directors voted against the loan because they doubted his solvency? In effect the court says to a suitor, "We decide for you, but two or three judges still think you are wrong." Dissenting opinions of judges can have but one purpose, and that is to give a judge an opportunity of exhibiting his individual views and opinions. The public cares little about his individual views. The only concern of the public is with the decision of the court as a court, so that they may know what it is, and know how to govern themselves. The curtain should not be raised to present the disagreeable picture of family discord and want of harmony. The people cannot change the result, but must accept it as the majority decides. It is a maxim of the law that it is to the interest of the public that there should be an end to litigation. It certainly is to the interest of the public that when a question is settled by the highest tribunal it should remain settled for all time. The result of a dissenting opinion is simply to open up for future discussion, litigation and bickering the question which should then be finally settled by that tribunal. Somebody must settle this question; it must be settled somewhere; this tribunal is selected as the final arbiter, and when it once settles it, it should be settled forever.

Another very important thing about a dissenting opinion, especially if it is well written, is that it impresses not only the particular litigant, but the public who read it, with the idea that injustice has been done by the courts; a feeling of dissatisfaction arises, a feeling of great wrong is cast broadcast. The court has been weakened in popular esteem, for in the opinion of the reader it has lent itself to injustice and inflicted wrong.

At least one good result would follow the abolition of dissenting opinions—the main opinion would be shorter and more concise, stating in plain English the points decided, and succinctly the reasons therefor; for all the judges, being to some extent responsible for it, would see that it was not filled with obscure illustrations and beclouded with alleged reasons of doubtful logical force. If we had shorter opinions the judges would have time to write better ones.

Nothing of any benefit to the public can be gained by a dissenting opinion.

Mercury on Aluminum.

M. C. Margat is reported to have made a curious discovery regarding the action of mercury on aluminum. He says that if the surface of a plate of aluminum, which has been well sand-papered, is rubbed lightly with amalgam of mercury, there will be produced upon it within a very short time an extraordinary efflorescence. The surface of the metal will soon be covered with a growth of alumina, which will shoot up literally within plain vision. No more remarkable sight is to be observed than the formation of this miniature forest, which attains, in the course of half an hour, a height of nearly half an inch.

If the metal is brushed over it will be found pitted, as if with acid, at all the parts in which this rapid oxidation has taken place. But a little heat applied to the plate suffices, by reason of the volatilization of the mercury, to arrest the phenomenon entirely. It will, however, be reproduced every time the surface is rubbed anew with a little amalgam of mercury. The experiment succeeds more easily with the amalgam, as it is difficult to sufficiently pulverize a drop of mercury with the finger, the metal not soaking into the aluminum. It is probable that the mercury produces catalytic action, and that it then allows the aluminum disintegrated by its pres-

ence, or perhaps reduced to a porous condition, to be more readily attacked when cold by the oxygen of the air. Nevertheless the plate is heated to a degree appreciable to the touch and actual combustion is evidently established.

South Africa and British Columbia Compared.

It costs money to open mines on the Rand, South Africa. This is shown in a report by C. Wilson Moore to an extraordinary general meeting of the shareholders of the Sheba Queen Gold & Exploration Co., which was held in London recently, in which he stated that the deep level mines, as a rule, require from £400,000 to £500,000 to make them productive.

From this it will be readily seen that the Rand is not a poor man's country like this is. Take the leading mines of the camp, for instance, and what was spent to make them producers? The Le Roi paid from the grass roots, and was owned by comparatively poor men, until its dividends made them wealthy. The War Eagle had a pay chute that extended from the surface, and before this chimney was worked out by the original owners dividends to the amount of \$187,000 had been paid. When the pay chute had been worked out it was sold to the Gooderham-Blackstock syndicate for \$700,000. The latter company was ambitious, desired to mine on a large scale and spent a large sum in placing the property in condition, so that nearly \$3,000,000 worth of ore was in sight before it began to take it out and pay dividends. In order to accomplish this magnificent result a little over \$200,000 was expended. In the Center Star, it is claimed, when it was sold to the Gooderham-Blackstock syndicate there was something like \$3,000,000 worth of ore in sight, and those who pretend to know allege that not over \$200,000 was spent to attain this splendid result. The management claimed to have spent more than this sum. Take the Iron Mask mine, which was a poor man's proposition from the start. It has paid its way and has now large reserves of ore, and as soon as its enlarged plant is installed it is certain to become a dividend payer. The property does not owe any money and all that has been expended upon it was taken out of the mine, and whatever money was used in the preliminary development of the property, and it was not a large sum, was borrowed from the old War Eagle Company, and was repaid out of the proceeds of the mine. The Columbia & Kootenay was developed into a producing property for a merely nominal sum. Then there are many other properties in this camp that can easily be made to yield a profit when from \$50,000 to \$200,000 has been expended upon them. This is in marked contrast to the £400,000 or the £500,000 required in the Rand to bring deep level mines up to the productive stage—and by productive is meant that they will simply produce ore in fair quantities. It does not mean, even after they have expended the large sums spoken of, that they have uncovered millions of dollars' worth of ore as was the case with the War Eagle and the Center Star.—Rossland, B. C., Miner.

Thought He Saw the Cage.

The death of Stephen Jeffrey, who stepped into the shaft at the Silver King mine, recalls to mind many similar fatalities from the same cause—that of a miner stepping into the shaft under the impression that he was stepping into the cage, says the Bradbury, Montana, *Times*. Old miners who have had narrow escapes from death from this optical delusion always feel the cage before stepping in, as they will not trust to the eyesight again after being once deceived. In the case of Jeffrey there was an electric light shining right on the spot where the poor fellow thought he was stepping into the cage, when the cage was not there at all. Had it been where he had always been accustomed to see it at that particular time, all would have been well. The shaft was clear, but to Jeffrey's eye the cage was the black, yawning shaft of death. It is quite likely that his partner saw the cage, as well as Jeffrey, because he was following close behind, and appeared very surprised to see Jeffrey disappear. Had he seen differently he would have called to Jeffrey ere it was too late. It is a common thing for miners to see the cage or skip in the shaft at the level or drift they are working in, when in reality it is not there at all.

The truth of the above will be felt by thousands of men who have had the same singular impression. Another curious fact is that when one is running a car he goes with it. The writer has personal knowledge of two instances, one where he was running a car in a drift, and it unexpectedly went into a sump, he going along with it, and also following it when he ran it off the end of a track over the edge of the dump. In each case he could and should have let go when he felt and saw the car upending, but for some unexplained reason he clung to it and went, too, and has been told by many miners that they have done just the same thing.

A Mine Shaft Cased With Steel.

At Cripple Creek, Colorado, the Portland M. Co. proposes to fit out its main shaft with steel, the supports and sets to be of that material, with timber for lagging.

The three-compartment shaft of that company is timbered, and the expense item is becoming burdensome, not only on the ground of safety, but on account of the heavy expense of securing and transporting the heavy timbers necessary. This big shaft has always been a problem with the company, and as depth is gained its importance steadily increases. A few weeks ago, says the *Denver Republican*, it was suggested to the manager that a shaft composed practically of steel was practicable at a cost only a trifle in excess of wood, while the durability would be much greater. The suggestion was immediately taken up by the management, which, upon investigation, determined that a shaft constructed of steel would be stronger, more durable and cheaper than the ordinary timber shafts, with a saving in the time of construction.

The corner posts are to be composed of structural steel 1 inch thick, cast at right angles, with the angles inside, the several lengths solidly bolted together. The square sets are of the same style of iron, to be firmly bolted to the uprights at intervals of 6 feet. The lagging is to be composed of 4-inch plank, set in endwise, with broken joints, so that the pressure will in no place come against more than 6 feet of plank.

The cost of the steel structure with the heavy lagging is just the same as if the shaft timbering was composed entirely of wood, but the saving is in the rapidity of construction, the greater durability of the steel and the saving in excavation. A timber shaft requires timbers of from 10 to 12 inches square, while the steel is but 3 inches thick, and, on account of its shape, presenting a sharp edge to the rock, can be readily fitted with a few blows of a pick. The saving in excavation in a three-compartment shaft, such as that in use at the Portland, amounts to nearly a yard and a half of rock work for every foot of depth gained—an important matter in such a shaft as the Portland, with its 1000 feet of depth.

The Manufacture of White Lead by Means of Electricity.

In a paper read before the Hygienic Council of the Department of the Seine, says *L'Electricien*, M. Ribau claims to be able to manufacture white lead by means of the electrolytic decomposition produced by currents. Tubs of sandstone are provided, in which is a mixture of carbonate of soda and chlorate of soda in solution. In this liquid thin sheets of lead are immersed, the sheets being placed in a vertical position parallel with each other and separated by a small interval of space. Sheets in pairs, for example, are united to the positive pole of an electric source, while single sheets are united to the positive pole. When the current is turned on, chlorate of lead is produced, and this chlorate of lead forms, on contact with the carbonate of soda, hydro-carbonate of lead. Wooden rods, placed between the sheets of lead and made to oscillate by means of a common axle, are used to maintain by agitation the homogeneity of the bath and to scrape, as fast as it is produced, the white lead adhering to the sheets of lead. The white lead falls to the bottom of the tubs, from which it is taken, and through a filtering press. The liquid that remains in the tubs is poured into a special kind of reservoir, when a current of carbonic acid regenerates the carbonate of soda at the expense of the soda which had been liberated by the current. This returns the mixture to its primitive condition of carbonate and chlorate of soda. It remains to be seen whether or not this process is applicable to industrial pursuits and if the white lead thus obtained possesses the qualities of that article as manufactured by the older methods. If the experiments above alluded to are satisfactory, the process of thus producing white lead should be encouraged, since by this process the risks of saturnine intoxication are reduced to a minimum.

A METHOD of producing iodoform by the aid of electricity has just been invented, and is said to yield satisfactory results. The apparatus consists of an ordinary battery jar, closed with a plate of India rubber, and containing three platinum plates of electrodes. The middle one, which is about eighty-five square meters in surface (centimeters), serves as the anode, and the cathodes are wrapped in parchment paper. Between the electrodes were placed two entrance tubes for gases and an exit tube. The charge consisted of a solution of potassium iodide, sodium carbonate and alcohol, the whole being kept at a temperature of 65° by a water bath. The iodoform was removed every eight ampere hours, and the corresponding amount of iodide of potassium and twenty cubic centimeters of alcohol added. A slow current of carbon dioxide is passed through the cell to take up the caustic potash formed at the cathode.

The lightest metal tubing is made of nickel and aluminum.

California Iron—a Neglected Industry.

TO THE EDITOR:—In the MINING AND SCIENTIFIC PRESS of Dec. 11th, '97, appeared an article bearing the very pertinent inquiry "Why should we not make our own iron?" by R. B. Symington, M. E., of San Francisco. For nearly a year I have scanned the columns of this most excellent journal for something more upon the subject, but in vain.

It has occurred to me as being quite paradoxical that in a State like California, whose people have a wide reputation for enterprise and liberality, and within whose borders is contained vast quantities of the raw material of highest grade and greatest purity, that an industry of such commanding importance as that of iron and steel production should, year after year, be permitted to remain dormant.

I apprehend no one will question the value of such an industry if successfully operated, nor that we have the raw material in quantity and quality I have indicated. Should the latter proposition be questioned, let the doubter visit the iron mines or more properly "prospects," in San Bernardino county, near Newberry, on the line of the Santa Fe Pacific Railroad, and as he stands upon the immense outcroppings, rising many feet above the surface, of a vein 400 feet wide of solid Bessemer ore, of a purity unsurpassed, and looks down, and up upon other black and brown and red veins of like high grade, both narrower and wider, none of which being of less than 100 feet in width of solid ore, he will be a doubter no longer. Such a body of ore if situated in Pennsylvania or the central west would be looked upon as of inestimable value and its development would be a question of but hours, not years. California's reputation in the mining field has been made in the recovery of the yellow metal from her rich gravel beds and the development and operating of her numerous quartz veins bearing the same valuable metal, and it seems hard for her people to look with favor upon the development of the baser or more common metals, yet the day will come when the mining of, reducing and converting this now despised iron will rank as a wealth-producer and man-employer, a close competitor with any other industry within our borders.

To-day the foundries, machine shops and great manufacturing establishments of this State are handicapped by the excessive cost of cast iron, steel billets, etc. The East is supplying our people with a majority of the manufactured articles of steel and iron in use. These imported manufactured articles, of which iron or steel form all, or the principal portion, amount to tens of thousands of tons, and many millions of dollars in value annually. These articles are shaped by many thousands of hands of men and women, whose eyes have never been gladdened by a sight of the "Golden West" or whose bodies have never been invigorated by contact with our unsurpassed climate.

There are doubters who, pointing to the idle blast furnace on the Columbia in Oregon, and another one in Washington, say pig iron cannot be successfully produced in California. There have been other doubters in other ages. The telegraph, the telephone, electric light and the steam engine were all subjects of greater doubt, but the prophets who doubted were glad to retire to a blessed oblivion. So will those who assume to forecast the doom of the iron industry in this State. During the past six or seven years I have given the subject some thought and study, and I undertake to say iron can here be produced at a profit and at the same time dropping the price at least \$2 per ton below that which pig iron now commands at the chief points of consumption on this coast. The lowering of the price of pig metal \$2 per ton to our home manufacturers would give such an impetus to the manufacturing industry as to soon well nigh double the production of the present, with a corresponding increase in the employed.

The two lone furnaces of Oregon and

Washington—the sole monuments of a neglected industry between Cape Horn and the mouth of the Yukon—are too small for profitable practice under modern conditions. The Washington furnace went out of blast because its home or domestic ores were so "lean" as to require mixing with ores imported under tariff charges from British Columbia. The Oregon furnace—a very good small plant in its day—began operations on its 34 per cent ores, which gradually dwindled down to 22 per cent when it went out of blast several years ago. Its ores were too lean for reduction anywhere, requiring the melting of from four to six and one-half tons of ore flux, etc., to produce one ton of metal. It could not be a success even with \$12 to \$15 per ton in its favor in the matter of transcontinental freight charges. With the high-grade "San Bernardino" ores of southern California, which yield 68 to 70 per cent metallic iron, but a trifle above two short tons of ore and flux would require to be reduced in order to produce one long ton of pig metal—quite a difference in favor of this State as compared with the northern furnaces.

It is objected that the high fuel cost places California outside the range of successful iron production. I agree that fuel on this coast is very high, but that is not the only element or condition governing the profitable production here. It would not be an objection were its cost five times what it is if the commodity produced were correspondingly high. The writer remembers that the price of coke on this coast has, during the past six years, receded nearly as many dollars per ton, and it is not believed that it has yet reached the limit of reduction. So far as to the comparative cost of producing a ton of pig iron, as between Pennsylvania and the central West, or in southern California, we here stand on an equality in the matter of ore cost, freight on the same and in labor, both skilled and unskilled. In the matter of ore grade and in climatic conditions, the advantage is with us. In the one matter of fuel, we are at a marked disadvantage. The fuel cost to produce one ton of metal here would at present be from \$4.50 to \$6.50 greater than in the East; but we must not overlook the fact that, while the price in the South is about \$7 per ton and in the North and East about \$10, the former commands \$18 and the latter about \$20 per ton here, thus leaving room for a healthy reduction in the price and a handsome profit.

By the uninformed the question is asked, "Where do you expect to find a market for your iron after you have produced it?" The reply may be given, "We have found it. San Francisco consumes at present not less than an average of 1000 gross tons per month, supplemented by a large consumption at Oakland, Alameda, San Jose, Sacramento, Stockton, Fresno, Bakersfield, Los Angeles and San Diego in California and Portland, Or., Seattle and Tacoma in Washington. Japan imports many thousands of tons from the United States. We might get part or all of that. And then there is Hawaii and the South American ports which would likely be customers. It is no longer a question of either a market or of a profit on the output, but one of finances for erecting and operating a modern, up-to-date blast furnace.

So long as we permit our best resources to lie dormant we are hardly doing justice to our reputation for reputed capital or progressive enterprise. How long shall we continue to import a commodity, either in the "pig" or manufactured state, while our mountains are groaning under their weight of massive ore, with which nature has so bountifully supplied them, and many of our deserving citizens stand waiting with enforced idle hands for the hour when capital, brains and determination shall join to give them relief, richly remunerate the investment and greatly add to the strength of the commonwealth?

C. L. HUBBS.

San Diego, Cal., Oct. 23rd, '98.

Form of Contract for Driving a Level.

The following is a good form of contract and may serve as a basis for drafting such a document:

..... MINE CONTRACT.

Sealed bids will be received until 10 o'clock, A. M., 1898, for linear feet on in Good Intent crosscut, La Paz Mining District, at office of Company at Silver City, Colorado, subject to following terms and conditions:

Size.—..... shall be high in the clear above the track inside of timbers, width feet inside of timbers at bottom and feet inside of timbers at top.

Drainage.—A drainage ditch shall be made the entire distance at such place as may be directed by our then acting foreman, not less than eight (8) inches deep and twelve (12) inches wide, and shall be of that depth and width under the mudsills, where mudsills are used.

Grade.—The shall be on a grade of to each one hundred (100) feet.

Timbering.—All timbers shall be furnished in the works by the Company, framed and shall be put in the places designated by the Company in such manner as the Company may direct.

Track.—The rails, spikes and ties will be furnished by the Company, and laid down by contractor according to the instructions of the company's foreman.

Ore.—All ore should be carefully removed by the contractor and saved for the Company. Provided, if Company desire, it may remove the ore itself, and if taken down by the contractor, it shall be done under instructions and in such manner as the Company's foreman shall direct.

Tramming.—All tramming shall be done by the in such a manner as not to interfere with or impede other work in the Good Intent crosscut.

Work.—Work shall begin within days after acceptance of bid, and shall be continuously prosecuted with not less than shifts and men per each twenty-four (24) hours until completion. All work shall be done in first-class workmanlike manner according to direction of Company's foreman, and in case of dispute, the decision of our then foreman shall be final and binding.

Payment.—Payment shall be made within five (5) days after completion of the contract and acceptance thereof by our then acting foreman, and if contractor fails for any reason to complete contract according to specifications, no payment whatever shall be made said contractor for any work done under the contract. No payment shall be made under the contract until contractor furnishes receipts in full for all work and labor done or material furnished under the contract.

Blacksmithing.—Company shall do all blacksmithing necessary for the contractor, and the decision of the acting foreman of the Company shall be final as to such necessity.

Powder, Fuse, Caps and Tools.—Powder, fuse, caps, tools, candles, etc., shall be furnished by the contractor.

Stopes.—Provided, that the Company shall be permitted to stope within twenty (20) feet of the breast of the drift or crosscut mentioned in this contract.

Forfeiture.—Company shall have the right to declare an absolute forfeiture of this contract for failure to perform the number of shifts herein provided for, as provided for, or for any other violation of these specifications.

The company reserves the right to reject any or all bids.

A CABLEGRAM asserts that a record of 40.8 miles an hour was made at the second trial of the torpedo boat destroyer Hal Lung, built at Elbing, Germany, for the Chinese government. The runs were made in the open sea between the lighthouses at Pilau and

Brusterort, which are 19 knots apart. The wind was fresh and there was considerable sea on.

Progress in Gold Dredging.

Dredging for gold in California streams, like all forms of mining, is a progressive science. Considerable has been done in the last five years. In New Zealand, also, gold dredging occupies considerable present prominence. In the province of Otago, N. Z., in four weeks eighteen dredgers secured 1600 ounces of fine gold. Two dredgers on the Kawarau river, near Cromwell—the Ranfurly and the Magnetic—show what progress is there being made in dredge construction. The Ranfurly dredge is 109 feet long, and, including the stagings fore and aft, 120 feet; width, 25 feet 6 inches; depth 7 feet. The ladder is 75 feet between centers, and will dredge to about 50 feet; the screen is 4 feet in diameter and 25 feet long. The buckets have each a capacity of 5½ cubic feet. The main engine is of 16 H. P., and will be steamed by a multi-tubular externally fired boiler, working up to a pressure of 140 pounds. The winches are driven by a pair of horizontal engines, built into the frame of the winch, and fitted with reversing gear. The dredge is also supplied with an auxiliary steam winch, driven by a worm and reversing gear. A lathe is fitted up on board, driven by the engine of the auxiliary winch. A novel feature of the dredge is an overhead crane for lifting large stones off the buckets, or for lifting the buckets themselves, weighing about 700 pounds each. The screen is driven by friction rolls, and both the rolls and the path in the screen are turned. The elevator is 35 feet between centers, and is driven by a belt up one side, which is housed in under the platform. The main drive is by ropes, the screen, centrifugal pump and elevator being driven by belts, each separately driven. The tables are 20 feet by 17 feet, in six divisions, and a special device enables water to be turned on to any particular table independent of the others. The dredge will be lighted by electricity.

In the issue of Oct. 15 was noticed editorially the new use of gas from a furnace blast in the cylinder of a gas engine. It is learned that M. E. Heirman has formulated a new cycle of operations with the view of using such gas. In this method mixed gas and air is introduced under pressure behind the piston at the beginning of the stroke, is cut off by a valve at any desired point and simultaneously ignited. Since there is no clearance space or compression chamber in the cylinder, the products of combustion are entirely expelled during the return stroke. This method accomplishes two important objects, i. e., an explosion for every revolution and an automatic cut-off like that of a steam engine.

THE lake steamer Troy has gained the reputation of having developed the lowest figure for coal consumption per H. P. that has ever been accomplished on the lakes and probably in the world. The vessel is 402½ feet in length, 42½ feet beam and 28 feet in depth. The quadruple expansion engines with cylinders 19, 27½, 40 and 58 inches in diameter and 42-inch stroke, are supplied with steam at 210 pounds pressure. She recently made the remarkable performance of developing 1690 I. H. P., which showed that the coal consumption per H. P. per hour was 1.5 pounds.—Engineer.

C. A. SCOTT of the computation division of the Coast and Geodetic Survey, has been awarded the Wilde prize by the Academy of France. The Wilde prize is a coveted honor, open to the world, to be conferred on one judged the most worthy from among those who make discovery or write works on astronomy, chemistry, geology, physics or mechanics. The award to Mr. Scott is based on a work on terrestrial magnetism. The committee which made the award consisted of some of the best known scientists in France.

Mining Summary.

ALASKA.

The steamer City of Topeka, from Alaska, reports that heavy snowstorms have visited various sections of Alaska and nearly all mining operations have been suspended, except quartz mills located near tidewater. On Nov. 2nd 4 feet of snow fell on Chitoot and White passes, which completely put a stop to travel. Telephone messages from Lake Linderman to Skagway announce that about 400 persons are snow-bound there. It is stated that 500 claims have been filed and recorded in the Atlin mining district and that 1000 men will winter there.

The new stamp mills on Douglas Island are about ready. These give Douglas Island a total of 80 stamps, with a capacity for crushing 2500 tons of ore daily. The stamps will be operated as follows: Treadwell, 540; Mexican, 120; Union, 100; Ready Bullion, 120.

The Treadwell is reported to have 8,000,000 tons of ore in sight. The ledge on the Ready Bullion has been traced for 900 feet along the beach and hill, its width being from 30 to 100 feet on the surface. A shaft has been sunk 650 feet, at the bottom of which the ledge has widened to 300 feet, carrying \$12 to \$14 in gold per ton. New stamp mills are being erected on the mainland, making a thousand stamps on and adjacent to Douglas Island.

The regular monthly report of the Alaska-Mexican mine showed 13,405 tons ore crushed and 281 tons sulphurets treated, the latter yielding \$5823. Bullion product for the month, \$25,929; expenses, \$20,501; average yield of ore, \$1.93 per ton.

The report by Major Walsh to the Minister of the Interior, respecting the Yukon district, has been issued. He says, to permit of this district being thoroughly prospected and developed, the population must be assured of its food supply beyond a peradventure and at reasonable prices, and the only way in which a supply can thus be secured is by providing transportation facilities. The collection of royalty will amount to about \$500,000. He says the Postoffice Department should take over the mail of the district, and certainly the Dawson part of it. The service is growing larger and requires the full attention of a postmaster, with a few clerks thoroughly educated in the service, as it is impossible for the police to handle it satisfactorily. He recommends the establishment of a branch postoffice at the forks of El Dorado and Bonanza creeks; recommends that an assistant judge for Dawson district be appointed and that one of his duties be the deciding of mining disputes, and says the output this year from the Yukon district will be in the neighborhood of \$10,000,000.

ARIZONA.

The Oro M. Co.'s mill, in the Oro Blanco country, will likely start up soon.—The Merriweather Bros. are again operating mines at Richenbar.

Near Tucson, Sullivan & Co. are chloriding their ores, which are principally lead. They are taking out two carloads a week, shipping to El Paso. They get \$25.50 per ton net. They have a 4-foot vein of ore which runs well in lead and \$5 in silver.—In the Hardy copper group, near Fairbank station, a depth of 180 feet has been reached and a drift run 20 feet on a 4-foot ledge. The ore goes from 45 to 60 per cent in copper, besides some gold and silver.

Prescott Courier: The new management of the Little Jessie mine is putting in new machinery and a large force has been put to work.—In the White Elephant group of mines near Prescott, being developed by Johns & Engle, a body of ore was recently struck which assays \$6 in gold, eight ounces in silver, and 12 per cent copper.—The Tintic mine has been drained and development resumed.—The Black Rock mining camp, Geronimo, received two carloads of machinery.

Tombstone Prospector: Copper ore is found in the Copper King Co.'s mines at Solomon Springs.

Yuma Sentinel: The American Girl mine, in the Picacho district, near Yuma, the property of ex-Gov. Markham and others of California, is giving good results.

CALIFORNIA.

Amador.

At the Potazuba mine, Sutter Creek, they are raising from the 200 level to connect with the winze above. They have 150 tons of ore on the dump and will soon have a crushing.—The Bay State, Centennial and Wheeler mines near Plymouth are in operation.

Butte.

Russell & Malone, near Big Bend, are working in an old river channel and carting the dirt for washing to the Feather river. It yields good returns. They are also digging a ditch to bring water when the winter rains come.

The first general meeting of the shareholders in the Con. Gold Mines of California, Ltd., was held in London, Oct. 20th, to pass resolutions for accepting the properties of the old company of the same name. The company was registered after the reconstruction had been agreed upon, but according to the law of California it was necessary that the resolution should be passed by a majority of two-thirds of the shareholders. The resolutions were carried. The chairman stated that the whole of the 250,000 £1 shares, with 17s 6d paid up, had been allotted, and the calls paid, with the exception of some £30. On June 9th G. H. Evans, the Gen. Mgr. at Orville, wired that a pay chute had been struck, and since then a telegram announced a second similar discovery. They would have commenced crushing before now but for the exceptional drought.

Calaveras.

The Diamond Jack mine, near San Andreas,

has been bonded to San Francisco people, who have begun work sinking a shaft and putting up machinery.

Mokelumne Hill Chronicle: The Gwin mine at Mokelumne Hill continues crushing. The ore has improved in value and an additional forty stamps is contemplated.

Del Norte.

Crescent City Record: The Jones Creek M. & C. Co. have bonded their property to R. C. Hall of San Francisco for \$25,000, of which \$5000 is to be paid Jan. 15, 1899, and the balance in installments of \$5000.

El Dorado.

(Special Correspondence).—The Jumper M. Co. will soon give results of its two years of development on the old Griffith mine near Diamond Springs. This property yielded good ore to water depth, but after that it passed through years of struggle and finally abandonment. The Jumper Co. has extensively opened the mine in its old workings and in new ground. The Griffith is a mother lode property, and the method pursued by the present company is bringing out the merits of the old mine.

Sinking and drifting have been in progress night and day since the Jumper began its operations. Among the results justified by their thorough test of the Griffith mine the company has about completed a 20-stamp mill and an electric power plant from the Crawford power house, all of which is expected to be put in operation the 15th inst. This will be the first electric plant in this portion of the county and it is quite probable that other mines in this section will soon be operated by the same power.

The old Dalmatia and present Gopher Boulder mines at Kelsey are equipped with electricity, though at present they are simply using their pumps. The owner, W. H. Bail, a resident of London, England, will be here within a short time, and it is said here by his representative that he will either operate the mine or lease it, so that a renewal of work is almost a certainty. There are a 20-stamp and two Huntington mills and eight concentrators on the property.

The Gold Bug mine in Placerville continues its development work. The property is bonded to a Fresno company; they made their first payment on the mine last week.

The Selby mine near Diamond has twenty-five men employed. This property was worked to some extent by San Francisco and Montana people, but abandoned about a year ago. The present company it is stated will sink to considerable depth.

Placerville, Nov. 7th, '98.

Humboldt.

C. Foote has bought the Moston property, comprising 3000 acres of placer ground along Trinity river in Trinity and Humboldt counties for \$145,000, to be paid by 50 per cent of the gross proceeds out of each cleanup being applied on the purchase price. Work has begun on shafts, tunnels and ditches, thirty-five men being employed. It is expected that hydraulic mining will begin about Feb. 1st, '99.

Kern.

Randsburg Miner: Work is progressing on the Yellow Aster mines. The new pump at the wells was started last week. The six miles of 5-inch pipeline is complete to the mill site. The lumber is on the ground for the foundation of the 100,000-gallon water tank. Instead of one large wooden tank, as at the wells, several smaller iron tanks will be used. The Yellow Aster people have milled 1500 tons per month for eighteen months and not a pound has been milled that did not go \$30 average per ton.—The Tribby tunnel has developed some remarkable ore. A seam was found in the 40-foot ledge last week from which 100 pounds of ore was worth \$1000, or \$10 per pound. The whole mountain seems to be a body of ore that will pay from \$7 to \$8 per ton. This is outside of the high-grade ledges.

Los Angeles Mining Review: The last cyanide run at the Eureka mill at Randsburg netted \$1100. The plant is extracting from 90 to 95 per cent of the gold in the tailings. The stamps at the mill are dropping on Stringer rock.—In the 350-foot level of the Wedge 1 foot of good ore has been opened up. Some of it exceeds in value anything yet taken out of the mine.—Word has been received at Randsburg that the Supreme Court will reopen the case brought by Stanton against the Yellow Aster Co. and referred back to the lower court.—Griffith & Co. of the Johannesburg mill have bought the G. B. mine in the Stringer district. It is opened by shafts and drifts and shows a body of medium grade ore. They will at once take out enough ore to keep their mill busy at times when it is not occupied with custom ore.—The richest ore found in the Kinyon mine was extracted last week from the 150-foot level.—The Yellow Aster Co. have closed their contract with the Union Iron Works of San Francisco for a new mill to be ready for work Jan. 15th. The mill will have a capacity of 150 tons per day. The company's mines are looking good. Work at the wells continues.

Napa.

The quicksilver mines near Calistoga shipped in October 1107 flasks—an increase of 304 flasks over September.

Nevada.

(Special Correspondence).—The water famine through which Nevada county thought it had safely passed, so far as related to the operation of many of its stamp mills, has not permitted the season to close without shutting down some of the largest plants in the county.

The companies whose mills operate by electric power continue their operations uninterrupted. But the largest probably of the county's gold producers, that have heretofore relied upon water for motive power, are furnished water enough for pumping only. The effect of this enforced idleness is keenly

felt by the large number of men who are temporarily idle, and it brings to mind quite vividly what a profitable industry mining is to a community like Grass Valley and Nevada City when it thrives, but is to be looked upon when everybody is busy in a cursory way as an every day affair. The enforced closing of the big mills will aid toward the prospecting and opening of new properties to which capital will come as a profitable venture.

It is noted that some Colorado papers remark with some facetiousness that California is offering drouth as an excuse for the diminished gold output of the current year, but that this should be attributable rather to the fact that California mines are nearly worked out. When it is borne in mind that nearly 200 stamps within a small radius in this section alone are hung up for want of water, the gold output of the State will of course be greatly lessened, but the properties, far from being worked out are most of them only beginning in their history.

The payment of a dividend by the North Star Co. near Grass Valley amounting to \$50,000, after costly improvements in machinery and the purchase of the Grass Valley Water Co.'s plant for \$50,000, shows that the several properties being developed under this company's systematic methods are a profitable property. The ground had long been idle until taken up by the people now operating it. The 40-stamp mill is at work day and night. Much of the ore is drawn more than a mile by steam wagons from the Central and Massachusetts Hill shafts. The former is over 1200 feet deep vertical, and its hoisting machinery and power plant are a model of their kind. Compressed air, heated, is used. A. D. Foote is Gen. Mgr.

Placer.

The Gold Blossom and the Three Stars mines, near Auburn, are closed down for want of water.

Nevada City, Nov. 7th, '98.

The old Red Hill mine, near Nevada City, has been leased to Grass Valley miners for two years, and they have begun to sink a new shaft.

The Harrison gravel mine, near Nevada City, is taking out pay dirt and finds coarse gold.

W. H. Henry has six men sinking a shaft on Albion Hill, near Grass Valley. The assays show a satisfactory average. East Oakland people are interested.

Grass Valley Union: The W. Y. O. D. G. & S. M. Co. has conveyed to the Grass Valley Exploration Co. the W. Y. O. D. General Grant, Dewey-Hobson, Telegraph, Parr, Sims and Nuttall mines. This new corporation will operate these properties under the same management that has heretofore worked the W. Y. O. D. mine.—The Malakoff Co. at North Bloomfield has struck gravel in their tunnel and it seems to be the rim of the channel.

Plumas.

The Quincy Independent says that P. Turner is developing a property near Quincy that yields good grade ore and upon which a mill is contemplated.

Quincy Bulletin: Four Hills mine, near Johnsville, has now completed a dam 120 feet long, 37 feet high and 12 feet wide, of rock walls. There are fifteen men employed in the mine, and work will be continued during the winter. Next summer a mill will be built on the property, which is owned by the Four Hills M. Co.

San Bernardino.

T. P. Crowder has discovered a vein of coal near Cajon which is traced nearly a mile and gives indication of yielding a good quality of coal.—The Pacific Coast M. Co. is preparing to mill the ore from the Fleming mine on Baldy. A roller mill, tramway and other machinery is being put into place.

San Diego.

Ramona Sentinel: It is locally said that a good strike was recently made in the Ranchita mine at Julian.—The Helvetia mine has a large force of men at work and will soon put on more. The pumps are working day and night.

Shasta.

(Special Correspondence).—At the National mine near Buckeye development continues and ore is being blocked out preparatory to starting the mill so soon as water can be had for the electric plant. The mine has been put in good order to become a productive property, but at present shares the fate of other properties affected by water famine. Ore production for the smelter continues in the Whitehouse section from the Evening Star and Garfield properties. Their ore is carried by a wire tramway nearly a mile, across the Sacramento river, to the railway. At the Uncle Sam mine near Kennet a large force is at work. This property belongs to the Sierra Buttes Co. The Mt. Shasta mine near Shasta is outputting a good grade of ore, all of which is hauled to the smelter. This property, among others, gives evidence that quartz mining in this county is but making a beginning, and that the possibility of disposing of ores at the smelter is also an inducement toward furthering the industry. The Mountain Copper Co. have changed their schedule for working custom ores. Instead of charging \$3.50 per ton, and returning 95 per cent of the ore value, they now return 75 per cent of the assay value of the ore. Because ores were not a free milling quantity they were by many people condemned as worthless, and the county in general was of necessity compelled to pass through a series of quiet years, so far as mining was concerned. The impetus it has received within two years and the present success of properties that receive systematic and thorough development are proof of the merit that Shasta county possesses, and in which capitalists are gradually becoming interested.

Redding, Nov. 8th, '98.

Redding Free Press: J. Brown recently took

out a \$3000 pocket near Whiskeytown.—The Washington M. Co., near French Gulch, is putting up a new 5-stamp quartz mill. It will be run by water power.—Near Copper City Sales & McDonnell are getting out ore for shipment.—The Princess Hydraulic M. Co. contemplates making extensive additions to its water rights and ditches on Broad creek near Whiskeytown. The extension is one mile long, including a tunnel of 700 feet.—J. H. Morton, representing capitalists, put six men at work on the Hiatt & Dale mine in the Old Diggings district.

Redding Searchlight: A strike has been made in the Philadelphia mine near French Gulch.

Sierra.

(Special Correspondence).—The company that has been operating the South Fork and Lucky Dog drift mines has ceased work, which, it is locally reported, amounts to abandonment of the properties. Work on the North Fork continues and is giving very good returns, much of the gravel yielding \$4 a carload. The company has expended a large sum of money in opening this mine.

Forest, Nov. 7th, '98.

Siskiyou.

Fry & Macaulay will soon have their mill completed on Cherry creek and begin crushing from the Ironsides mine, which they recently bought.

Yreka Journal: A mill has been completed at the Schroeder mine at Deadwood and will soon begin crushing. The creek bed has been prospected from near Shasta river to the northern boundary of Yreka and for some distance in town, and the company will determine shortly upon future proceedings.—The Greenhorn blue gravel mine is paying well, and has a supply of water by pumping from bedrock into a reservoir.—Hunter & Co. of the Cherry Hill mine, on Cherry creek, are putting up a mill, which will soon be ready for crushing.—A strike is locally reported in the Eagle quartz mine at Indian creek, in Scott valley, of good yield.—D. W. Jones' quartz mine in Quartz valley employs twenty-seven men and is taking out good quartz.—Morrison is crushing good rock at the Allen mill in Quartz valley.—Kingsley & Hay have resumed work on their mine near Scott river.

Trinity.

The Brown Bear M. Co. at Deadwood is enlarging its milling capacity, putting in boiler, air compressor and additional machinery.

Tulame.

Jamestown Magnet: In the Arizona mine, Tutletown, the shaft is 300 feet deep, and discloses 3 feet of quartz and several feet of vein matter.—At the Trilium mine, Jamestown, No. 2 shaft is down 640 feet. Drifting is going on at No. 5 level north and south with good results.—H. Bogan and partner found a pocket from which they got \$2500 in gold.—No. 1 shaft at Santa Ysabel mine has reached 520 feet. The drift at No. 4 level cut through the central ore chute, showing 6 feet of ore. The mill is waiting for water.

Sonora Banner: The Turner Flat Drift Gravel M. Co. on Table mountain sunk a shaft to bedrock, 92 feet, from which tunnels were run 500 feet. A pump with a capacity of 300 gallons per minute is in action. The water that is pumped from the mine is used for sluicing purposes and 400 buckets are washed every twenty-four hours.—Foster & Hamilton have reopened the Good Hope claim, which has been idle for a long time.—Sinking at the Never Sweat is in progress by Jardine & Copp.

Sonora Democrat: The Lillian mine near Sonora has been bonded by G. W. Fisher & Co. The property has much development. The company also secured bonds on the North Star and Golden Eagle claims, twin locations in the vicinity of the Lillian.—The new 300 H. P. steam plant at the Black Oak is in operation. Steam is conveyed from the big twin boilers to the mill, 700 feet. The Black Oak mine shows a large slope of high-grade ore.

Sonora Independent: In the Tarantula shaft near Sonora crosscutting at the 700-foot level is in progress.—Work has begun on the Anaconda near Columbia.—The Rappahannock is drifting on the 1100-foot level.—The Harrison mine at Jacksonville is putting in a new pump.—The Dunsmore mine near Columbia has forty men employed building a mill, etc.—The O. K. near Sonora are running a crosscut tunnel and a shaft and upraise will be started soon.

COLORADO.

BOULDER COUNTY.

J. Smith has shipped 700 tons of ore from the Boulder mine at Caribou the past six weeks and netted good returns. The tonnage of this property and others in that district promises to be so large as to induce the North-western to extend its line to Eldora, or at least to a point between Nederland and Caribou.—Twenty-two veins are said to have been cut in the Mogul tunnel at Eldora within a distance of 700 feet.—The E. & M. mine at Ward has shipped 302 tons of milling ore and 41 tons of smelting ore the past thirty days.

CHAFFEE COUNTY.

A steam plant is to be installed on the Golden Wonder mine, Turret City. One of the veins has from 6 to 7 feet of ore that is said to run from \$100 to \$200 in gold.

EAGLE COUNTY.

The ore shipments from Battle Mountain district since Jan. 1st are 344 carloads.

CLEAR CREEK COUNTY.

Leasers working the Demby mine, near Idaho City, are drifting on their lode through the Knickerbocker tunnel, which is 600 feet below the shaft of the Demby and over 1000 feet distant. They have good ore in the lower shaft workings.—The Mammoth tunnel is working three shifts on the air drills. Some veins have been cut, but the big one will not be reached for another thirty days.

It is said that in a distance of 1000 feet from the heading of this tunnel 100 veins will be cut.

EL PASO COUNTY.

The Gold Coin people at Victor, it is locally reported, owing to the reserves of medium and low grade ores, have decided to build a large mill at the mine.—The Hull City placer, Cripple Creek, produced during October \$133,000 worth of ore.—Sixty-five tons of three-ounce ore was marketed from the Cleveland lease of the New Zealand Co.'s Deadwood mine on Bull hill.

Work has begun at Victor on an ore reduction plant, to cost \$75,000, by the Onelda Reduction & M. Co. of Colorado, A. Seiboth Mgr.

From the mines at Goldfield about 100 tons of ore are shipped daily. Of this, the Legal Tender produced last month 2700 tons, of which a large proportion was of smelting grade.

A. Madden is said to have discovered a 3-foot vein of tungsten near Wilbur.

The Victor Record says that at a depth of 300 feet in the Thompson mine, on Gibbons hill, a vein has been opened that is from 50 to 60 feet wide. The ore is of a milling grade and the mine is producing from thirty-five to forty tons daily.—The yield from the Cripple Creek district for October amounts to \$1,478,700—an increase of a few hundred dollars over September, but an increase in tonnage of 1000. This increased tonnage is due to the Metallic Reduction Works at Florence, which put through their plant 11,500 tons, as against 8400 tons in September. A new feature in this report is the high-grade ore treated in the district by the small plants in Cripple Creek and the different towns of the camp and placer gold bought by these plants, converted into bullion bars and sent to the U. S. mint. Conservatively, the bullion value of this class of ore is placed at \$15,500. Adding October's output to that of former months, the total of nearly \$13,000,000 has been reached for '98.

GILPIN COUNTY.

Central City Observer: During October were shipped from Black Hawk 300 cars of ore—an increase of twenty tons over October, '97.—The Rocky Mountain concentrator, in October, produced 600 tons of concentrates.—The Kansas-Burroughs Con. for October shipped 3500 tons.—The Cook G. M. Co. reports an output of 2800 tons for October, 80 tons of which was smelting ore.—The Concrete G. M. Co. reports an output last month of 1472 tons.—During October 5550 stamps were dropping in Gilpin county.

GUNNISON COUNTY.

A strike has been made in the Moss Rose property, near Gothic. This mine had been idle a long time.

LAKE COUNTY.

Leadville Miner: The output from the Mab mines for October was 4000 tons. At times the average was 200 tons daily.—The Rialto M. & L. Co., operating a group of claims through the deep Pyrenes shaft, is running drifts with eight-hour shifts at 1230 feet depth.—The last of the four special sinkers was started to work in the Bon Air shaft on October 28th, and the water is being lowered at the rate of 8 to 10 feet every twenty-four hours. Everything indicates that the mines will be ready for the resumption of work within ninety days. Three 80 H. P. boilers at the Penrose and the same number at the Bon Air furnish steam. The coal required is thirty tons per day and the cost of operating the two plants does not exceed \$8000 a month.—Shipments from the Mahala mine, Leadville, have been increased from 50 to 100 tons daily. Exploration by the diamond drill shows the ore body to be extensive.

IDAHO.

The Rapid River Copper M. Co. of Colfax, Wash., owns seven claims in the Seven Devils country, on which there is a ledge that runs from 70 to 90 per cent in copper. The company has a force getting out ore, and will start a pack train to the nearest transportation point next spring.

The Camas mill at Hailey, the first cyanide plant in the locality, is closed for the winter; it was operated with satisfactory results.

Near Lewiston S. I. Silverman has secured the Badger mine and will resume development at once. Over \$50,000 was spent on this mine by the old Badger Co. After it was fitted with expensive machinery the ore body pinched and it was abandoned and has been idle for eight months.

McDowell & Patterson, leasing on the Niagara mine near Hailey, have struck a foot ledge of high grade ore.

In the Friday mine, near Boise, a ledge has been uncovered 80 feet and a chimney 20 feet long, from which 300 sacks of ore have been stored, the lowest assay of which is \$60 a ton.—A consignment of auro-cyanides from the Camas No 2 at Hailey was shipped last week to Salt Lake City.

In the Pierce district near Kendrick more systematic mining has been done this season than at any time in its history. There are over 100 men working for wages in this neighborhood. The Mascot M. & M. Co., working the old Blanket ledge on Gold creek, is taking in a new stamp mill. The last mill run yielded \$15 per ton.—In the Democrat mine a tunnel has been driven 900 feet; the ore averages \$6 per ton. Pockets have been found where the ore has assayed high. Eight men are employed. A 10-stamp mill will be put on the property soon. J. Dunn is the Supt.

Florence Miner: A What Cheer ore test has been made to demonstrate the advisability of placing a mill on the property. The ore was an average taken from the mouth to the face of the tunnel. The returns from the plates were \$11.85 in gold, and concentrates per ton value of \$220.33. Owing to the failures in this camp this summer, the directors and stockholders of this company had become doubtful of the advisability of putting a mill on the property at the present time, but this

test demonstrates that it has sufficient ore of a value that would make it one of the best paying propositions in camp, with the proper reduction works. There has been a tunnel run in on the ledge 527 feet at a depth of 310 feet. The average width of pay ore is about 30 inches. E. Lortscher is Gen. Mgr.

Wallace Press: The Mammoth M. Co. has begun work on a tunnel which will be the second one in length in the Cœur d'Alenes, and will be one of the largest mining development works undertaken here for many years. The tunnel will cut the ledge in 3500 feet and will cut the vein 1800 feet below the surface, and will be 1100 feet below any work that has yet been done. Supt. Wilson calculates that it take two years to complete the work.

Cœur d'Alene Press: Every mining man who has visited the gold belt of the Cœur d'Alenes since quartz mining became an established industry, has commented on the lack of improved concentrating machinery, although all our ores are base enough after a few feet depth is attained that a large part of the values cannot be saved on the plates. This backwardness is all the more noticeable because on the South Fork the silver-lead miners have the most perfect machinery to be found anywhere in the world. Until less than a year ago the mills had nothing more effective than bumper concentrators, except in the Jenkins and Daddy mills, where canvas plants had been put in with very indifferent success.

MONTANA.

The silver smelter at Great Falls, which has not been in operation for several months, started up recently to an extent greater than for several years and employing 175 men. The supply of ore on hand is large. The East Helena works of the company have been run almost to their full capacity recently.

Last month seven carloads of concentrates were shipped from the mines of the Vermilion M. Co. at Missoula from which good returns reported. This month double that number will be shipped.—The Hidden Treasure mine at Clinton has begun to ship ore.

Clancy Miner: Work on the Liverpool mine near Clancy will resume soon. The shaft will be sunk to the 600-foot level.

NEVADA.

The Glasgow & Western Co. in Cherry Creek shipped a boulder of ore containing over \$500 in silver, lead, gold and copper. The boulder weighs 500 pounds, and is from the Star workings at Cherry Creek. A carload of this ore is on the road to Salt Lake City, the last one yielding the company about \$20,000. The foundation has been laid for the new Star mill, and the machinery is being delivered. The grading for the railroad between the company's plant at Golconda and the Adelaide mine in Humboldt county has been completed and laying of rail will begin shortly.

The Dexter Co. have started their new shaft at Tuscarora. It will be sunk 400 feet.—The Magnolia M. Co. of De Lamar will build a mill next year.

The Austin Reville learns that a ledge 68 feet wide and averaging \$14 per ton has been cut in the Drinkwater tunnel at Silver Peak. The property belongs to Mr. Blair of New York and being worked for him by S. Wasson. The Douglass mill at Dayton started up on a two-months' run on rock from Washburn's mine and the Justice.

From the Eureka and Hamilton districts for the week ending Nov. 4 were shipped 307,910 pounds of ore.—At the Chairman mines at Ely, White Pine county, T. T. Lane has given up the bond on the property. It is said that the Lanes spent \$150,000 on the mine and plants, and though they introduced improved appliances they failed to extract as high percentage of value from the ore as their predecessors had done with an old mill.—The Magnolia M. Co. of De Lamar, Lincoln county, will build a mill next year.

NEW MEXICO.

A shipment of silver-lead ore was made from the Rex and Percha mines, Hillsboro district, to Silver City.—The Bennett Stevenson mine, in the Organs, is being worked with a full force and silver-lead concentrates are being shipped.—The Cochiti G. M. Co. has 120 men on its payroll, besides seventy-five men cutting wood under contract.—O. P. Posey has taken the Victor group of mines in Colla canyon, where extensive work will be done.

Near Hanover Brockman & Hughes are taking out ore that runs 17 per cent copper, three ounces silver and carries a percentage of iron.—F. Bell, at the Philadelphia mine, is making shipments of a good grade of copper ore.

A. E. Dawson, Mgr. Santa Rita Copper & Iron Co. is shipping five cars, over 100 tons, of iron daily.—The Hearst Co., in the valuable properties which they have leased from the Santa Rita Copper & Iron Co., has 100 men employed, mostly on the royalty or tribute system. They are said to be making good pay and shipping a large amount of ore.

Hillsboro Advocate: The Trippie mine at Hillsboro shipped fifty-five tons of 100 ore to the smelter last week.—The Snake mine made an eighty-ton shipment.—The October output of gold from the dry washers at Hillsboro amounted to \$1400.45.—The Richmond mine made a shipment recently of \$175 per ton ore.—The Moreno Valley M. Co. have closed down their placer works for the winter. Their last weekly clean-up was \$960.

OREGON.

The Bellvue properties in Granite county, though the season was short for lack of water, paid the owners well; and though the mill has closed, the blocking out of ore continues.—The Red Boy has 30 feet of \$30 ore exposed, and in addition to this there are 3 feet of ore that yields higher values.—The Victorator mine in Grave Creek district is being fitted up by a company of Colorado people who have bought a big area of ground.

The Baker City Democrat enumerates

twenty-five shipping mines in the neighborhood of Baker City. The amount of concentrates shipped in October was 619,834 pounds.—The Robbins mine, near Baker City, recently passed to Pennsylvania capitalists, who intend to operate it on an extensive scale. The plans are arranged for deep sinking and the necessary machinery will be placed and work will begin immediately.—At the Denny group a 7800-foot tunnel has been started.—In the Sumpter district the mines are employing large forces and there are hundreds of men at work where a few years ago there was no employment of miners at all.—At Granite, J. W. Larkin is doing extensive development on the Cougar mine.

On the Magnolia mine, J. W. Vinson has a force at work and the showing is good.—The Red Boy mill is dropping twenty stamps.—The Red Boy Co. is building a mill on the May Queen mine.—McElroy & Sheridan have leased their Little Giant mine to Seattle people who are doing development work.—At the Golconda, E. & E., North Pole and Columbia mines, in Cracker district, there is much activity. At the Golconda 100 men are employed. The new mill will start about Dec. 1st.—The North Pole M. Co. are satisfied with the result of their operations.

Ashland Tidings: The Gold Bug M. Co.'s property on Mt. Reuben, Josephine county, is being opened up in a thorough manner. Senator Jones and others of Nevada are interested. A wagon road fourteen miles to Glendale has been built at a cost of \$13,000, and a sawmill with a capacity of 5000 feet per day erected. R. W. Jones is Supt. The machinery for the stamp mill is arriving.

Baker City Democrat: The Ohio mine in Cracker Creek district has a 10-stamp mill operating by water power. The shaft is 500 feet deep.—On the old Connor creek mine near Baker City development work will continue during the winter.—Grants Pass Courier: The Placer mines near Grants Pass are prepared for the winter work.—The survey on the mining ditch from Cow creek in Douglas county to Grave creek in Josephine county, about fifty miles, will be begun in a few days. The Victorator Co. are the projectors. This ditch will cover a many thousand acres of placer mining ground and will be one of the largest hydraulic mining enterprises undertaken in the State.

SOUTH DAKOTA.

Black Hills Mining Review: Near Portland, the lessees of the Ben Hur claim are taking out from ten to fifteen tons of ore per day. The shoot averages 10 feet in width and runs from \$30 to \$70 a ton gold.

UTAH.

The Watson ore chute in Winnamuck ground at Bingham has been found and yields a good quality of silver and lead ore.—The output of the Ophir mill was 1420 tons during October, with a total of 2943 tons for the last sixty days. Work for the winter is likely to cease at any time.

One worth \$12 per ton in gold is coming out of the two upper shafts on the Omaha of West Dip.—From Tintic last week's shipments were seventy-five cars of ore, ten of concentrates, and two bars of bullion.

Mercur Mercury: At the Daisy mine, Mercur, the output is of a high standard. A drift is being run to tap the vein at a depth of several hundred feet.—Eight carloads of ore are being shipped from Stockton every day.—The Geyser-Marion made a shipment of cyanides last week.—The roaster at La Cigale mine is nearing completion.

Tintic Miner: The Gemini, Eureka Hill, Godiva, the Uncle Sam and Humburg, at Eureka, ship about 800 tons of ore a month, with a valuation of probably \$75,000.—The Bertha mine shipped a test lot of ore, the results of which warrant a continuation of work on the property.—Two shifts are at work on the Tetra tunnel. A power drill will be used.

Bingham Bulletin: The Old Jordan mill at Bingham is turning out concentrates rapidly, but Supt. Holden says if lead goes below \$3.50 he will shut down.—Cutler & Cowan shipped three carloads of ore from their Ashland lease.—Gravel was struck in the West Mountain placer, and good pinnings made.—Progress is being made on the Highland Boy tramway.—The Erie finished a fifty-ton shipment last week.—A strike has been made in the King Solomon mine, near Ogden. In the 600-foot tunnel a ledge was disclosed, 8 or 10 feet in width; the values average 2 per cent lead, an ounce in silver and \$6 in gold to the ton.—At Larling Bros.' mill, Park City, an average of six tons of high-grade ore concentrates is worked every twenty-four hours.

The Salt Lake Tribune says the local samplers during October handled over 15,000 tons of ore.—Samples from the ore body into which the Mercur Co. is driving on Lulu ground showed an average of \$62 gold per ton.—At the Swan-Bemis mill, Bingham, an average of sixty tons of ore a day are treated.—The Ontario at Park City, during October, marketed 200 tons of ore at a profit.

Salt Lake Tribune: Samples of ore from the Midas mine in the Deep Creek country shows encouraging results. The owners were a short time ago joined by John Dern of the Mercur mine and they will erect a mill this season. The milling ores average about \$10 in gold per ton.

WASHINGTON.

At Republic the Gold Leaf tunnel was driven 75 feet in October. It has reached 225 feet.—The Little Cove north drift is in 360 feet and is again being crosscut. It was run 100 feet in October.—The cross tunnel on the Knob Hill was advanced 100 feet during the month.—The Princess Maud tunnel was driven 125 feet in October and is being pushed at the rate of 5 feet a day.—The Mountain Lion mine has a road completed so that machinery and wood can be delivered at the tunnel. The foundation for the compressor is completed.

At Republic the Ben Hur mine encountered 5 feet of ore and the ledge shows between 2

and 3 feet of mixed vein matter in addition.—Nineteen feet of high-grade ore is the latest news from the Republic mine, and the crosscut is still in ore. The first level in this mine is 135 feet deep. The second is 235, and the present strike is almost 200 feet lower still, about 425 feet vertical depth. The next tunnel will give a depth of about 625 feet.

Two-thirds of the Merrimac claim, at Republic, was sold to a company represented by W. S. Norman of Spokane for \$10,000.

WYOMING.

The Rambler mine, in the Grand Encampment district, has done much development work. The ore body at 210 feet depth is said to be 4 feet wide, carrying from 60 to 75 per cent copper and about \$4 gold. The ore is hauled to the railroad with ten-horse teams and trail wagons, carrying from 14,000 to 16,000 pounds to the team.

FOREIGN.

BRITISH COLUMBIA.

The Swansea mine at Windermere has been developed to a considerable extent by shafts and tunnels. All three shafts are in pay ore and the tunnels are being driven for crosscuts. One of them has passed through the vein, showing it 30 feet wide. A shaft has been sunk in the tunnel, which shows 4 feet of green carbonate of copper. This ore yields a good profit. The assays of this ore run from 20 to 35 per cent copper. It is the intention of the owners of the Swansea to work the mine during the winter and make large shipments in the spring.

The Pacific Northwest M. Co. of London, England, has bought a hydraulic mine, near Yale, of large extent and begun preliminary work. This is said to be the same company that operates the Snowshoe mine near Libby, Montana.—Recently the Le Roi mine at Rossland in twenty-four hours hoisted and placed in ore bins 725 tons of ore, not counting the waste extracted the same time.—The shipments for the same day amounted to 440 tons and the output for October was over 12,750 tons. The mine employs 300 men. The shaft is 810 feet, and the station at the 800-foot level has been commenced.

On the Bosun property, Slocan, twenty-five men are employed and 120 tons of ore shipped per month.—The Second Relief mine near Erie, belonging to A. A. M. Campbell and J. A. Finch, is being developed by three tunnels, connected by winzes, and over 1200 feet of tunneling has been done. The ore is a copper sulphide running well in gold. The gold values of the lead, which is of an average of 34 inches for 1200 feet, are \$50 per ton. About half of the gold can be recovered by milling, and it is intended to erect a stamp mill on the property and ship the tailings to the smelter. There are about 1500 tons of this ore on the dump ready for shipment which will be hauled to the railroad as soon as snow falls. A wagon road thirteen miles in length has been built from Erie to the mine at a cost of \$16,000.—The Mascot mine at Kamloops, owned by J. H. Russell, has been bonded to an English company for \$5000.—Thirty-five men are employed on the North Star, East Kootenay, and contracts were made for the hauling of 1000 tons of ore to the railroad.—Klimpton & Co. near Windermere shipped twenty tons of ore to the Kaslo smelting works. It cost \$30 per ton to have the ore packed.—The shipments of ore from the Slocan from July 1st to October 20th, '98, were 11,043 tons.—The War Eagle mine at Rossland is daily shipping 150 tons of first-class ore. The major portion of this is taken from the stopes between the 500 and 375-foot levels. The motive power to be used in the operation of the mammoth compressor and hoist will be electricity. The management hopes to have the new plant ready for operation before the first of January.—The water is low in the Quesnelle and the Olson dredge has shut down for the season.—It is locally reported that a six days' run at the Athabasca mine near Nelson produced \$4000. This does not include the concentrates, which carry a value of 40 per cent.—At the Silver Cup group in the Lardeau there are 350 tons of high-grade ore ready for shipment. The average value of the ore is said to be \$165 per ton. These properties are owned by the Sunshine, a subsidiary company of Lillooet, Fraser River and Cariboo Gold Fields, Ltd., of London, England, with a British Columbia office at Revelstoke.

Enough snow has fallen to enable the Comstock, Slocan, to rawhide ore to the wagon road. Several carloads will be shipped.—The second cleanup of the Cariboo Hydraulic M. Co.'s properties on the south fork of the Quesnelle, made a week ago, is valued at \$36,000, making the total for the season \$100,000.—The Pilot Bay smelter will resume operations when the coke supply is available from the Crow's Nest.

At Alberni, in the Thistle Group, bonded by Capt. De Lamar, work has been suspended, the miners discharged and the work thrown up, the tunnels driven having failed to penetrate the ore deposits indicated by surface outcroppings, to the satisfaction of M. K. Kinslingbury, the engineer in charge of the mine.

The output of the Le Roi mine at Rossland for October was 12,750 tons. Rumor is again in circulation that the Le Roi mine will pass into the possession of the British-American Corporation soon.

Rossland Miner: The Hall mines at Rossland will install a six-drill compressor and is making arrangements for electricity sufficient to run both the Hall mine and the Hall smelter.—The new crosscut tunnel in the Velvet has been begun. It is expected that the vein will be met at the 400 foot station in the tunnel. In the Commander the developments show an increase in quartz and white iron, while there is not so much copper as was in the ore chute at the 250-foot level.—The total output of the Le Roi for October was 12,960 tons, or more than 400 tons daily.

JAPAN.

A sulphur mine in the Brat Tilboeff Island

of the Chishima archipelago, which was discovered by Koho Kasai of Hakodate, was being worked during the last few years, the products being disposed of at Yokohama or Hakodate. For the present year the output is estimated to exceed 2000 tons, which will be refined at the Hakodate smelting furnace. According to a reliable survey the vein is said to contain a rich deposit of sulphur, although the quality is not quite up to the standard expected. After next year the work will be conducted on a more extensive scale to meet the growing demand for the mineral, and the smelting will be carried on in the island, for the transportation of the sulphur to Hakodate to be refined involves a heavy outlay owing to the rise in the rate of freight charges between the island and Hakodate, and of insurance premium.

LOWER CALIFORNIA.

The iron mine near San Isidro, owned by A. Godbe, has been favorably reported on for prospective investors. The mine is a large deposit of iron ore.

MEXICO.

Le Monde Economique says: Discoveries of several deposits of tin have been made in Mexico, principally in the States of Guanajuato, San Luis Potosi and Sonora. The heights of the Sierra de la Estanera, in the mining district of Comanja, State of San Luis Potosi, contains tin ore which assays from 70 to 75 per cent of metal. In the State of Durango also tin is met with in considerable quantities, which, if properly treated, would yield from 35 to 75 per cent of metals, often under the form of oxides.

NEWFOUNDLAND.

At the new mine at Belle Isle, Conception Bay, 200 men work on the surface of the ground, scattered over a considerable area. It is an open quarry of red hematite iron. The ore lies in a horizontal stratum, three miles in length, a quarter of a mile in breadth and about 5 feet in thickness.

SOUTH AMERICA.

Franklin Ransom of Cleveland, O., has returned from Tierra del Fuego with nearly \$18,000 in gold. He says he has endured hardships, but will return to South America in the spring. All gold there is obtained from placer mines or is washed from black sand thrown within reach by storms, as on the Humboldt Co., Cal., coast.

Personal.

LOUIS JANIN is at Roseland, B. C.
D. W. NELSON becomes Supt. Robbins mine, Baker City, Or.
W. H. ALDRIDGE, Mgr. Trall smelter, Trail, B. C., is in Montreal.
J. E. HARVEY, Supt. Republic mine, Republic, Wash., is in Spokane.
H. B. ADAMS has been appointed Gen. Mgr. Bassick mine, Rosita, Colo.
CHAS. BUTTERS was last week examining a mine at Silver Star, Montana.
RICHARD A. PARKER is examining copper properties in southern Oregon.
D. SEARLES succeeds E. T. Hale as Supt. E. & E. mine, Bourne, Oregon.
CHIEF SIGNAL OFFICER GREELEY expects to be in San Francisco next week.
M. WATBRIGHT succeeds F. P. Ling as Supt. Greenhorn gravel mine, Yreka, Cal.
H. BRATNOBER passed through San Francisco last week on his way to London.
G. M. LAKENAN, managing owner Wisconsin mine, Grass Valley, Cal., is in San Francisco.
G. H. EVANS, Gen. Mgr. Banner mine, Oroville, Cal., has returned from San Francisco.
J. J. CRAWFORD, part owner Gwin mine, has returned from Calaveras and El Dorado counties to San Francisco.
C. A. HAMILTON, who is developing mining properties in Trinity county, returned to San Francisco from New River, Cal.
E. J. POINGDESTRE, San Jose, Cal., was investigating his mining properties at Brownsville, Cal., last week, with a view to resuming work.

Recently Declared Mining Dividends.

Empire State-Idaho M. & D. Co., Idaho, 1 1/2%, \$9375; payable Nov. 15.
Bunker Hill & Sullivan, Idaho, \$21,000; Nov. 4.
Pioneer G. M. Co., California, 12 1/2 cents per share, \$18,000; payable Dec. 15.
Grand Central, Utah, \$31,250; Nov. 10.
Silver King, Utah, \$37,500; Nov. 10.
Pennsylvania M. Co., California, 5 cents per share, \$2575; Oct. 12.
Yukon T. M. & E. Co., 2 cents per share; payable Nov. 16.
North Star M. Co., California, 25 cents per share, \$50,000; payable immediately.

Recent Mining Incorporations.

Aztec Turquois M. Co., San Francisco; capital stock \$50,000; subscribed; G. G. Carr, H. E. Wise, C. A. Maydwell, R. G. Hart, Jr., C. H. Holbrook, Jr., D. H. Whittemore, G. M. Leavitt.

Commercial Paragraphs.

THE Butte & Ruby Valley Smelting Co. has planned to erect a silver-lead plant of 100 tons per day capacity at Twin Bridges, Montana, which is about twenty miles south of Whitehall. The machinery will be supplied by the Colorado Iron Works, A. M. Grant, agent for the latter, having consummated the contract.

Coast Industrial Notes.

—The Southern Pacific Co. is looking for sources of coal.
—The sales of American type writing machines in Mexico amount to \$50,000 a year.
—Every sawmill on Puget Sound and Gray's Harbor, Wash., is running night and day.
—The Skagway, Alaska, railroad is now in operation thirteen miles to White Pass City.
—Grass Valley, Cal., on the 8th inst., voted in favor of the issuance of \$40,000 worth of sewerage bonds.
—From Everett, Wash., last week were shipped to Shanghai, China, 700 M feet of railway timbers.
—At Corvallis, Or., 60,000 pounds of hops were sold recently at an average price of 14 cents a pound.
—The Santa Fe Railway Co.'s oil property at Richfield Station, Cal., is producing an average of 300 barrels a day.
—The Stockton & Tuolumne railroad, building from Jamestown to Sonora, Cal., is within one mile of the latter place.
—The Santa Fe has ordered thirty locomotives, to be delivered at the rate of two a month, commencing with December.
—About \$2,000,000 is recommended for Government appropriation for next year's river and harbor work on the Pacific coast.
—A discovery of coal is reported in Whatcom county, Wash., near Deming. The ledge is said to be 10 feet thick and of a good degree of hardness.

—From Pullman and Garfield, Wash., have been shipped to Omaha and St. Louis 117 carloads of apples, for which the growers received \$1 per 100 pounds.
—The Crow's Nest Pass Coal Co., near Ferlie, B. C., has started burning in fifty coking ovens, and is distributing sample loads throughout the Kootenays.

—A fire at Sacramento, Cal., on the 7th partially destroyed the S. P. car shops, involving a loss of \$250,000, and temporarily depriving 500 men of employment.

—The Fresno, Cal., *Republican* says that in the last thirty days the California Raisin Growers' Association has paid the growers nearly \$1,000,000 and is still paying daily from \$40,000 to \$60,000.

—In Denver, Colo., the U. S. Circuit Court has granted to the Colorado Fuel & Iron Co. a temporary injunction restraining the various railroads from advancing rates from Pueblo to Pacific coast points.

—The *Victoria Times* says that the cannery and fishermen have experienced the worst summer on record in lower British Columbia waters, and that the combined Coho salmon pack does not total 40,000 cases.

—The import of salmon to San Francisco the last week of October was 5643 cases. The export was 104,160 cases. The amount of dried fruit exported was 216.38 cases. The amount of sugar imported for nine months was 246,762,000 pounds.

—A little more than thirty miles from the coast of Japan the Pacific ocean has been found to be more than 4643 fathoms deep. Some officers who were surveying for a telegraph cable found their wire broken at this depth without reaching bottom.

—A Chicago Electric Co. is considering a proposition from the Japanese Government to form in Chicago a syndicate with a capitalization of \$100,000,000, to install and build electric street car lines and incandescent lighting and power plants in the domain of the Mikado.

—At Peoria, Ill., the Japanese Government is reported to be buying enormous quantities of spirits to be used in the manufacture of smokeless powder. A solid train of twenty-three cars, which carries nearly 1,000,000 gallons, was recently shipped to Japan, and two more large shipments will go this month.

—W. B. Story has completed his reconnaissance between Bakersfield and Antelope valley, on the edge of the Mojave desert, for the proposed line of the Bakersfield & Los Angeles, Cal., Railroad Co. He recommends that several preliminary surveys be made by the way of Tejon and O'd Fort Tejon passes before a definite line is selected.

—Speyer & Co. of New York have bought \$10,000,000 Southern Pacific of California 5% first consolidated mortgage gold bonds, amounting to \$10,000,000, and due in 1937. The principal and interest are unconditionally guaranteed by the Southern Pacific Co. These bonds are part of about \$20,000,000 worth, in exchange for underlying bonds and for new construction.

—The Postoffice Department of Japan for the indirect exchange of money orders between this country and Corea, and on and after January 1, 1899, money orders may be drawn in the United States for payment at the Japanese postoffices at Chemulpo, Fusan, Seoula, Yuensan and Mukho in Corea, and in like manner at those offices for payment in the United States.

—General Passenger Agent Charles S. Fee of the Northern Pacific, who has returned to St. Paul from a long absence on the Pacific coast, speaks as follows in the *Pioneer Press* of this region: "I never saw such good times as now prevail in the far Northwest. I visited every city of consequence in that section and found not only prosperity, but hopefulness on the part of the people. There is greater confidence in the future than I ever observed there before. All crops have been abundant and good prices have been realized. Hops that sold for 10 cents a pound five years ago are now selling for 17 cents, and that is only one illustration of the general improvement. Farmers and business men are paying off mortgages and have something saved, and are happy."

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOVEMBER 1, 1898.

613,352.—BALL CASTER—G. L. Boveroux, Oakland, Cal.
613,404.—GOLD WASHER—G. H. Chick, Oakland, Cal.
613,398.—WATER BATTERY—H. H. Corter, S. F.
613,512.—WINDOW—B. Hausmann, S. F.
613,433.—NCT LOCK—J. W. Hines, Elma, Wash.
613,569.—TACK DRIVER—G. W. Hobbs, Los Angeles, Cal.
613,575.—MATCH BOX—E. D. Kellerman, Montezano, Wash.

613,487.—NECKTIE LOCK—E. A. Normand, S. F.
613,227.—RUNNER FOR VEHICLES—M. Palmtag, New Whitcomb, Wash.
613,292.—RUNNER FOR VEHICLES—M. Palmtag, New Whitcomb, Wash.
613,305.—ORCHARD PLOW—J. Porteous, Fresno, Cal.
613,470.—CULTIVATOR—F. A. Rice, Edna, Cal.
613,325.—CAR FENDER—J. Sexton, Los Angeles, Cal.
613,344.—CHILD'S HARNESS—M. R. Thompson, Olympia, Wash.
613,545.—SLEEPING BAG—Sarah Winters, Seattle, Wash.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SIDE HILL GANG PLOW.—Peter Maddocks, Tracy, Cal. No. 613,454. Dated Nov. 1, 1898. This invention is designed to plow especially upon side hills. It comprises a triangular frame mounted upon bearing wheels, with means by which the wheels can be adjusted. A double series of plows are connected with opposite sides of the frame, the standards being so hinged that those upon one side may be turned up free of the ground, while those upon the other side are turning the furrow. Thus when the plow is going in one direction upon the hill side one set will be at work and the other out of action; then when the plow is reversed to move in the opposite direction on the same side the other set of plows will be turning the furrow, and the first set will be out of action. The hinged plow standards are connected in series with rods, and these rods are connected by links with lever arms, by which the plow may be thrown out of or into action.

GOLD WASHING APPARATUS.—George H. Chick, Oakland, Cal., assignor of one-half to C. Zander, of Alameda, Cal. No. 613,494. Dated Nov. 1, 1898. This invention is designed to provide a continuously working apparatus for washing out gold and separating it from sand and other debris without stopping the work for cleaning up. It comprises a supporting frame with a chute mounted at an incline thereon, a main bottom having a stop or abutment at its lower end, a supplemental bottom formed of independent removable sections resting thereon and abutting endwise, each of said sections having a transverse rifle bar at its lower end, a superposed amalgamated plate and a plate fixed to the upper portion of the transverse rifle and projecting upwardly to form a chamber or pocket between itself and the amalgamated plate. A receiving box is fixed above the upper end of the apparatus having a screen bottom by which the coarser material is first separated and thrown out, and other screens situated above the inclined amalgamated plates so that a portion of the material passing through the first screens will be deposited on the first or upper set of plates, while a second coarser portion will be deposited on a second set of plates, thus separating and distributing the material and reducing the work to be done by either set of plates.

FIRE-PROOF WALL OR PARTITION FOR BUILDINGS.—J. T. McCormick, San Francisco, Cal. No. 613,462. Dated Nov. 1, 1898. This invention relates to improvements in the construction of fire-proof walls and partitions for buildings so that an economical construction is provided for building intermediate walls and partitions either with or without an air space. The wall or partition consists of vertical and horizontal bars interlocked at their points of intersection and with their edges approximately in the same plane so as to form a surface upon both sides for the application of the wire or metallic lathing. If it be desired to have an air space in the partition, the vertical bars are made of greater depth, and the horizontal bars are arranged flush with the opposite edges of the vertical bars, but not extending entirely across so that they leave an intermediate space after the lathing and plaster have been applied to the opposite faces.

COMBINED SLIDABLE AND SWINGING WINDOW SASH.—B. Hausmann, San Francisco, Cal. No. 613,512. Dated Nov. 1, 1898. The object of this invention is to provide a means for conveniently obtaining access to the exterior surface of windows by the employment of sashes in which the glass is set, which sashes are hinged to vertically slidable strips so that when the sash is closed into position it may be moved up and down like an ordinary window sash. The invention comprises in conjunction with these strips and sashes hook bolts, which

are adapted to engage with corresponding loops in the strips, counterweight chains connecting with the exterior faces of the strips so that the windows are counterbalanced and slidable, a stop bar fixed upon one chain and a plate fixed upon the channel on which the strip slides, so as to be engaged by the stop bar to arrest the strip so that the sash can be lifted and the hook bolts disengaged to allow the sash to be opened.

CULTIVATOR.—F. A. Rice, Edna, Cal. No. 613,470. Dated Nov. 1, 1898. This invention relates to improvements in cultivators which are especially designed as weed cutters, and it consists in such a construction as will sever all weeds at points below the surface of the ground, and also pulverize the surface without leaving furrows or trenches. At the same time the framework forms a clod crusher for breaking and pulverizing any clods which may be passed over by the machine, the ground being generally leveled and put into fine shape after the apparatus has passed. It comprises parallel beams, two of which are inclined upwardly, one being hinged to its companion and provided with means by which it can be raised or lowered with relation to the ground. Straps or connecting plates are secured at opposite ends to the outside beam only, and blades or cutters are fixed with the upper and lower horizontal portions and connecting portions set on edge and extending in opposite directions from the central line of the machine.

COLLAR AND NECKTIE LOCK.—E. A. Normand, San Francisco, Cal. No. 613,467. Dated Nov. 1, 1898. The object of this invention is to provide a device which is especially serviceable as a lock to prevent the collar button from being disengaged from the collar or from the shirt-band when the buttonholes in either have become worn or enlarged. It also forms a lock or holder to prevent the necktie from slipping out of place with relation to the collar. It may be employed to retain cuffs upon sleeve-buttons and for various other similar uses. It consists of a single piece of wire bent at the center to form an upwardly curved arch adapted to fit the shank of the collar-button, the ends bent in the opposite direction from the lower limits of the arch to form spring members normally inclined upward and formed with inwardly projecting hooks to fit beneath the edge of the collar, while the outer portion forms outwardly projecting hooks to engage the edge of the necktie, while the central loop is retained over the collar-button.

Catalogues, Etc.

THE "star" catalogue of all received this week is from the Gates Iron Works. It is a "general catalogue," not technical, nor special, nor in detail, but intended to show some of the machinery furnished by the Gates Iron Works. It is worthy of special note even in these fine de siècle days of fine catalogues, having all the first-class finish of a fine literary magazine. A postal request to the Gates Iron Works, 650 Elston Ave., Chicago, Ill., will bring any one a copy.

A BARGAIN.

Death of proprietor. PETALUMA MACHINE SHOP, FOUNDRY AND PATENTS. Will take city property in exchange. SANFORD BENNETT, 17 & 19 Beale St., San Francisco.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING CO., SAN LEANDRO, CAL., U. S. A.

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of 3/4-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

— BUILD THE —

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.

"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.

"UNION" COMBINED COMPRESSORS — 20, 30, 40 h. p.

HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.

"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.

TEN YEARS' EXPERIENCE Building Gas and Oil Engines.

"UNION" ENGINES Are in Use All Over the United States.

"UNION" ENGINES Are Simple, Durable and Economical.

Students can enter at any time. Pupils receive individual instruction. Twenty teachers. Moderate charges. Write for Catalogue and Journal.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

Assaying Gold

.....AND.....

Silver Ores.

A Standard Work.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores," etc.) that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price \$1.00 postpaid. Sold by the Mining and Scientific Press, 330 Market St., San Francisco.

RIVETED STEEL WATER PIPE

RISDON IRON WORKS **BEALE & HOWARD STS.**
MANUFACTURERS **SAN FRANCISCO, CAL.**

VULCAN ROPEWAY

— WITH —
**AUTOMATIC ORE LOADER AND
AUTOMATIC DUMPING DEVICE.**

For Conveying
Ore, Cordwood,
Etc.

EMPIRE, NEVADA, April 17, 1896.
Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.
Yours very truly,
J. P. WOODBURY, Supt.

Information as to advantages furnished by the

JOSHUA HENDY MACHINE WORKS,
Nos. 38-44 Fremont St., San Francisco, Cal.

DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 10, 1898.

SILVER.—London, 27½d; New York, 60½¢; San Francisco, 60½¢; Mexican Dollars, 47½¢@47½¢. New York exchange, sight, 15; telegraphic, 17½ cents premium.

Shipments of specie from San Francisco during the first ten months of '98 were \$47,405,200, against \$37,259,650 for the same time last year, and consisted principally of \$3,350,600 in silver bullion, \$3,768,290 in Mexican dollars, \$463,486 in silver coin, \$39,446,535 in gold coin, and \$337,494 in currency. Of this year's shipments \$5,779,113 went to China, \$300,000 to Japan, \$415,900 to India, \$501,000 to Honolulu, \$139,282 to Central America, and \$40,564,000 to New York.

LEAD.—Following election, says a New York dispatch, the market was purposeless for the most part to-day. While the list was steady in tone, business dragged in an unusual manner. At the close the Metal Exchange called Pig Iron Warrants very quiet, with \$7 bid and \$7.25 asked; Lake Copper firm, with \$12.62½ bid and \$12.75 asked; Tin quiet, with \$18.30 bid and \$18.50 asked. Lead quiet and steady, brokers' \$3.50, Exchange \$3.72½@3.77½. The firm naming the settling price for leading miners and smelters at the West quoted Lead to-day at \$3.50.

Local, pipe, 6@6½¢; sheet, 6½@7¢; pig, 5½¢; bar, 6¢.

COPPER.—New York reports Lake \$12.75@12.87½.

The following table shows the number of pounds and value of wire nails exported from the United States during the past decade:

Exports of wire nails from the United States:

| Year. | Pounds. | Value. | Price per Pound (Cents). |
|-------|------------|-----------|--------------------------|
| 1888 | 1,547,078 | \$155,403 | 10.0 |
| 1889 | 1,612,576 | 157,389 | 9.7 |
| 1890 | 1,955,359 | 160,510 | 8.2 |
| 1891 | 1,768,433 | 138,859 | 7.8 |
| 1892 | 2,056,267 | 160,239 | 7.8 |
| 1893 | 2,300,501 | 158,093 | 6.9 |
| 1894 | 2,233,776 | 180,607 | 5.6 |
| 1895 | 4,367,267 | 210,192 | 4.8 |
| 1896 | 8,031,927 | 321,055 | 4.0 |
| 1897 | 9,941,714 | 357,641 | 3.6 |
| 1898 | 22,894,099 | 458,787 | 2.0 |

IRON.—American, soft, \$21.75 and \$23.75 per ton; Scotch, \$24.25.

SPELTER.—5½¢@5½¢.

TIN.—Menlo Roofing, redipped, \$7; English, to arrive, \$4.50; Pig, 18¢; Bar, 19¢.

ANTIMONY.—9½¢, 10¢.

BABBITT METAL.—10-12-14—best 16¢.

QUICKSILVER.—Domestic, unchanged, \$41; export, \$37.00@37.50; carload lots, special rates.

POWDER.—F. o. b., San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½¢; less than one ton, 17½¢. No. 1* 60%, carload lots, 13½¢; less than one ton, 15½¢. No. 1** 50%, carload lots, 11½¢; less than one ton, 13½¢. No. 2, 40%, carload lots, 10¢; less than one ton, 12¢. No. 2* 35%, carload lots, 9½¢; less than one ton, 11½¢. No. 2** 30%, carload lots, 9¢; less than one ton, 11¢. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

FUSE.—Triple tape, \$5.10 per 1000 feet; double tape, \$4.35; single tape, \$3.45; Hemp, \$3; Cement No. 2, \$4.35; Cement No. 1, \$3.45.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9.

COAL.—San Francisco coast, yard prices:

| | | | |
|------------|-------------|------------|-------------|
| Wellington |\$8 00 | Cocos Bay |\$5 00 |
| Seattle |6 00 | Southfield |7 50 |

Cargo lots, Eastern and foreign:

| | | | |
|-------------------|-------------|------------------|-------------|
| Wallsend |\$7 50 | Cumberland |\$9 00 |

UNFAIR COMPETITION.

Our recent announcement that inferior goods had been sold and billed on the coast as our goods, and that our trade-mark numbers had been counterfeited, has disclosed an even greater extent of these practices than we had supposed to exist. To make the resulting damage to the reputation of our goods as small as possible and to protect our would-be patrons we repeat:

All our catalogue goods, except those listed by us as manufactured by others, are stamped with our name "Keuffel & Esser Co." or our initials "K. & E. Co." and where there is room for it, with our trade-

Our German drawing instruments bear only the trade marks  or  We never stamp our goods with catalogue numbers only, and goods so stamped are therefore not ours. All our goods are fully warranted to conform to the description we give of them in our catalogue and to be of the quality and grade specified. We make some lines of cheaper goods for the jobbing trade, but they differ from our catalogue goods in quality and appearance. These inferior goods are not stamped with any of our trade marks. Our catalogue goods are not furnished to any dealer or agent without our complete stamp as described above, and any claim that we furnish our catalogue goods by special arrangement without our stamp is therefore an attempt to deceive. Our special papers in rolls or sheets

Duplex Universal Anvil Baragow Normal

are watermarked or stamped along the edge with their name. Any claims that our papers are furnished by us in bulk without these names or that these papers have been obtained otherwise than through us, are absolutely false. We will thankfully accept any information bearing on the counterfeiting of our trade-mark numbers or the palming off of other goods as ours.

Very respectfully, KEUFFEL & ESSER CO.

FRESNO, June 25, 1898.

Assessment Notices.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill, Placer County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of October, 1898, an assessment (No. 14) of one-half of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 1209 Claus Spreckels building, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 25th day of November, 1898, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 14th day of December, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors.
J. J. CRAWFORD, Secretary.
Office—No. 1209 Claus Spreckels Bldg., San Francisco, California.

CONSOLIDATED ST. GOTHARD GOLD MINING COMPANY.—Location of principal place of business, 113 Crocker building, San Francisco, California; location of works, Nevada County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of November, 1898, an assessment (No. 16) of Ten Cents (10c.) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 113 Crocker building, sixth floor, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 14th day of December, 1898, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on FRIDAY, the 30th day of December, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors.
F. HOLLING, Secretary.
Office—113 Crocker building, sixth floor, San Francisco, California.

M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEO. W. FLEISSNER, Secretary.
Office—916 Market street, room 57, San Francisco, California.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over \$8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is today, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.
"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.18%."

February 19, 1897.
"Our furnace is now running very nicely indeed, averaging 80 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it."
"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The ROPP FURNACE is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (four furnaces); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Spelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

California State Miners' Association.

The seventh annual convention of the California State Miners' Association will be held in Native Sons' Hall in San Francisco, beginning on the 21st inst. Herewith appear portraits of some of its most prominent officers. Hon. Jacob Hart Neff has been president of the Association since it was first organized. To him, as much as to any one man, the Association owes its existence and whatever success has been secured. Mr. T. J. Parsons, president of the Del Monte Milling Co., has ably filled the office of vice-president, and on several occasions, when financial aid was needed, has been of valuable assistance in securing it. The same meed of honorable recognition is due Julian Sonntag, president Manufacturers' and Producers' Association, who, for three years as treasurer and two years as secretary, has labored for the advancement of the Association's interests. Mr. Samuel J. Hendy, president of the Joshua Hendy Machine Works, the Association's genial treasurer, has husbanded the Association's funds, and at the last meeting of the Executive Committee reported sufficient money in the treasury to meet the expenses of next week's convention.

It is believed to be the general wish of the miners of California that President Neff continue to fill that chair. He has just been elected Lieut. Governor of the State of California, and pleads that his time and approaching official duties preclude the possibility of further service. The MINING AND SCIENTIFIC PRESS is frank to say that it believes the Association can

not release Lieut. Governor Neff. His personal probity, great influence and powerful aid were never more needed than at present, and this paper but voices the sentiment of everyone, everywhere throughout the commonwealth in saying that he should continue in the position that he has so long adorned, and in which he can be of such benefit to the State. The recent

tremendous vote he received, leading his ticket many thousands, shows the esteem and confidence of the people, regardless of party or section.

If, however, it shall appear that President Neff continues positive in his refusal to serve longer than seven years, the Association will have to cast around for a chief executive officer, and in such an event it is believed that Mr. Wm. C. Ralston would be available timber. He is young, strong, physically and mentally equipped, enthusiastic for the Association and the principles it represents, has always been prominent in the councils of the Association, was long its efficient secretary, is a practical miner, and stands high in the estimation of his fellow working miners throughout the State.

It is very seldom that this paper gives place to portraits of individuals or has anything to say about any one, but on the eve of the seventh annual convention of the Association that represents 14,000 working miners and their allied interests it is in

order to say a little, solely for "the good of the order."

This paper considers that the secretaryship can be made the most important office in the gift of the Association. Like all the other positions, it has been ably filled by men who were proud to give their services without salary or hope of

J. H. NEFF, President.

T. J. PARSONS, Vice-President.

S. J. HENDY, Treasurer.

OFFICERS CALIFORNIA STATE MINERS' ASSOCIATION.

gain, but it is manifest that no capable man can be expected to give valuable time taken from the daily demands of private business. This journal believes that the horizon broadens; that the possibilities of the future of the Association grow wider, and that the California organization should reach out, enlarge its scope, secure new membership, increase public interest, call out its own latent resources, have county miners' associations in every county in the State, make it plain to every man in and around a mine or connected in any way with mining that it is a good thing for him, individually, to be a member of the State Miners' Association. One of the best ways to do all this is to get a suitable man for secretary, pay him a good salary, enough to justify the demand that he spend his whole time in developing interest in the Association, in securing membership, in pushing the work. That is the business view of it. It wouldn't be business to have a

mine superintendent or millman to whom no salary was paid, who worked just for the love of it, or the pride he felt in the success of the concern, and expect him to neglect his means of livelihood and give his time and efforts gratis; and it is equally impossible to expect to continue so fortunate as the Association has been in the past and get first-class service for nothing. Hence it looks to this journal that this matter of secretaryship is of prime importance, and in homely and honest phrase its opinion is so set down. The life of the Association depends upon renewed interest and increased membership. There is throughout a general friendliness expressed and there need be no insuperable obstacles to making the Association of greater scope and usefulness if it be made the constant business of some one competent man who is paid enough to keep at it all the time. It might be well to have it so arranged by the next State Legislature that the secretary have an office in or with the State Mining Bureau. This can be done. In any event he should have suitable headquarters with facilities for visitors, and when traveling around the State in the interests of the Association have suitable representation in his absence. The active membership of the Association needs to be increased and can be so augmented if miners in general can be shown that membership tends to their individual benefit.

The California Miners' Association is a non-political, non-partisan organization, devoted solely to the general interests of mining, with no reference to strikes, or wages, or sale of mines, or "booming" of mining property, or exaltation of any individual or section, but desirous of remedying any existing evils and advancing the general welfare of the mining industry. It is primarily based on the realization that, single-handed, the miner is handicapped and has little influence; but organized, with clear aims as to what is justly needed, and should be justly secured, common cause can be successfully maintained, and much general good

be resultant. It began at Auburn, Placer Co., Nov. 18, 1891; its first convention was held Jan. 20, 1892. It has done a great deal; allayed resentment; made dignified statement of its rights; has secured their partial recognition; has noted and observed the rights of others, and in a manly straightforward way has won the respect and confidence of the commonwealth. Its strength lies in the continuance of such policy, in the continued organization and maintenance of county miners' organizations, in careful selection of officers, in completing what it set out to do before taking up more complex propositions, and in securing aid from every honorable source without compromising itself or being tied up with any other interests than the great basic industry it represents. Though much has been done more remains to be done, that all forms of mining may go on in a manner that will work no injury to any man nor any interest, and aid the general progress and development of the State.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Officers California State Miners' Association—J. H. Neff, President; Julian Sonntag, Secretary; T. J. Parsons, Vice-President; S. J. Hendy, Treasurer, 501. Wm. H. Hoege's Establishment in Los Angeles, 507.
EDITORIAL.—California State Miners' Association, 501. Devoid of Mining Schemes; Achievements in Telephoning; Rapid and Profitable Precipitation; Newspaper "Science"; What Development Will Do; Labor and Machinery, 502.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 509-10-11.
THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 522.
MISCELLANEOUS.—Concentrates, 503. The Refining of Base Lead Bullion Containing Silver and High in Gold; The Present Conditions of Gold Mining in the Koochikara Region in the Gural, 504. Temperature of Battery Water; English and American Methods, 505. The Reduction Works for Silver Ores at Aduana, Sonora, Mexico; Tesla's Latest Claim, 506. List of U. S. Patents for Pacific Coast Inventors; Personal; Notices of Recent Patents; Coast Industrial Notes; Commercial Paragraphs; A Los Angeles, Cal., Establishment, 507. Horizontal Tubular Boiler; Storing Dynamite; Discrepancies in Slime Treatment; Meteorite Found in Oregon; Largest Freight Train Ever Hauled, 508. Recently Declared Mining Dividends; Recent California Mining Incorporations, 522.

THE London mining and financial journals are devoid of glittering prospectuses and advertisements of mining schemes. "The London & California Gold Mining & Milling Company," whatever that may be, has a prospectus setting forth the advantages of a mining property on "the Grizzly, Hog Eye and Alaska claims," near Pike City, Sierra Co., Cal. Shares in the scheme aggregate \$500,000, and the promoters want \$50,000 cash for working capital, which, under the special circumstances, seems reasonably dear.

A GOOD EXAMPLE of what development will do, and an object lesson in energetic working of promising mining property, whether gold or copper, is afforded in the case of the Calumet & Hecla, Mich., Copper Mining Co. In a brief note thereon, the Boston News Bureau of the 4th inst. says: "The present richness of the Calumet & Hecla mine was at one time entirely owned by President Mason of the Quincy Mining Co., and a large part of the richness of the Quincy was at one time in the control of the Franklin Mining Co. If either the St. Mary's Co. or its subsequent owner, Mr. Mason of the Quincy Mining Co., had kept the ground each at one time owned, the Calumet & Hecla mine would not to-day be in existence, and possibly the entire copper region of Michigan might be little more than a lumber camp. It is the wonderful manufacturing development made by the Calumet & Hecla Mining Co. with a dozen shafts and \$20,000,000 of machinery and plant that has given the impetus to Lake Superior copper mining."

Achievements in Telephoning.

Occurrences are now chronicled as ordinary, everyday matters that far exceed in wonder anything in the old legends of magic. This week a citizen of California talked from his residence at Santa Cruz to a friend at Boise City, Idaho—2100 miles. Between the two places stretches a copper wire, 436 lbs. to the mile, and over this are correctly carried all the tones of the human voice, inaudible twenty feet away from the transmitter. Elsewhere in this issue is noted the expectation this week in southern California of successfully transmitting electric energy eighty miles. And, probably, these things in the sunset years of the century are but foreshadowings of greater advances and achievements in the coming years.

Propheying the fruition of what is above chronicled as an accomplished fact, a telephone man recently wrote:

A little while hence, it will be possible for a man in Salt Lake, or Boise, or Helena, to talk with another man, as though face to face, in San Diego, Cal. The knowledge of that fact kindles a hope that by and by a line will cross that other Divide which lies in darkness under the shadow of the valley which we call Death, and that a "far-sound voice" will come to tell us of the beyond.

The suggestion opens up a new and interesting

field of scientific conjecture regarding a question of choice of future abode that has agitated the mind of man since the beginning, and is of overshadowing interest, even to those who have friends in both places.

Labor and Machinery.

An editorial paragraph in last week's issue made brief reference to the Government report of the Department of Labor, showing increased use of machinery and decreased cost of result. The paragraph is made the subject of comment in two of our contemporaries from what is believed to be a mistaken standpoint, and which is certainly a narrow one, the assumption being that the increased use of machinery "hurts labor." It does not. Nothing is more helpful to labor or more productive in affording increased employment than increased machine production at decreased cost; this, of course, not from purely a local standpoint, but in a broad, general way.

The usual argument in these cases is "by machinery one man does the work ten used to do; therefore, the other nine are thrown out of employment." "A new discovery of cheaper process destroys the vocation of a thousand willing workers, throwing them paupers on the community."

Some years ago when this paper, in an editorial article which led to the building of the road, pointed out the necessity and commercial profit of a narrow-gauge railroad to a point in Amador Co., Cal., a paper published therein inveighed bitterly against this paper and the proposition, asking, plaintively, what would become of the men who freighted in wagons, and the men who sold hay to the freighters, etc. So, generally, in the old countries, and in parts of this, where railroads were first introduced, coach makers, stage drivers, hostlers, blacksmiths, and many attendant workers, were thrown out of employment, horses were cheaper and horse feed slower of sale for a time. When a chemist found that a superior article of blueing could be made from coal tar, 100,000 Hindu workers in indigo plantations found their avocation gone. The use of the machine drill in our mines has caused many a man to lay his useless hammer by. The substitution of the linotype in many printing offices has given the faithful compositor an enforced rest. The use of electricity, gas and other modern forms of illumination has seriously interfered with the makers of candles. Columns could be filled with similar showing relative to the "displacement of labor by machinery" and by invention. But all this proves nothing. It only illustrates the spirit of progress.

The one undeniable fact, ignored by those who argue for stationary conditions, is that every new invention, or discovery, or use of machinery, leads to a new field for labor, a new demand for handwork, and calls into profitable employment a new lot of men. Our Amador Co., Cal., friend is now placated because of the increased prosperity of his town and county; more men are employed by the railroad than ever would be or could be by the "freighting industry." The Hindu indigo cultivators are inactive, but a million men are earning good wages in converting coal tar into aniline dyes; miners have in many cases ceased to pound the head of a drill, but they are getting better wages managing machine drills or opening up new mine values, while the manufacture of that class of machinery calls for skilled labor and makes possible a greater mineral development. And so it is in nearly every instance of the "displacement" of labor by machinery.

There is considerable foggy thought, or lack of thought, on this subject. The fact must be noted that where "by machinery one man does the work ten used to do," that ordinarily increases the product to a point where all the displaced workmen are needed to handle it, and that that particular industry soon needs more men than it ever did before. This is not theory; statistics, hard facts, cold figures prove it. It is also good to be remembered that labor-saving machinery increases the practical capacity of labor. If it does enable "one man to do the work of ten," then the labor of nine men had hitherto, in that case, been wasted, and they had to be supported without yielding adequate return, and their useless and unnecessary labor kept wages down. These nine men are now free to create new wealth or sell their labor or its product at increased figures in other departments of industry created and made possible by that

invention or discovery. Whenever one employment occupies the mind and muscle of two men, when one would suffice, one of these two is a drone and is being supported at the expense of that particular industry, and it is only when he is set free to earn a living that he begins to liquidate his account with the rest of his fellow-humans. In the long run, or the short run, no one need be idle unless he doesn't want to work.

Every advanced step in human progress creates a demand for labor; the vacancy is quickly filled; and in this way, labor-saving machinery is Labor's best friend. If any there be who read this and deny its truth, let them ask themselves this question: How does the life of the laborer to-day compare in comfort with the life of the laborer before labor-saving machinery came into general use?

Newspaper "Science."

The "scientific" articles that appear in sundry Sunday newspapers are of possible transient interest in whiling away hours of rest and relaxation on the part of their readers, but are not to be taken seriously. The articles and the illustrations indicate lively fancy and fertile imagination, but are not susceptible of confirmation or consummation. It is, of course, interesting to read that Sir Wm. Crookes has at last found how to talk to a friend in Melbourne, Australia, merely by thinking of him in London, England; that Thos. Edison is going to grind California gold ore and produce the metal 950 fine at a cost of 15 cents per ton; that Lord Kelvin has indorsed and advocated Prof. Emmens' plan for making gold out of silver; that Nikola Tesla has finally acquired complete control of the magnetic forces of the earth and can swing the planet into the sun or straight away from it as the notion takes him; that other men of equal note have discovered perpetual motion; the secret of human immortality; the way to produce "balls of electric light" anywhere, anytime by a wave of the hand; a mode of dispensing with water in all hitherto customary requirements of that useful fluid; the ability to go without eating, relying on absorption of tablets, and sundry other alleged discoveries. But all these imaginings while of pleasant interest are given publicity in the daily papers merely to sell. The paper is sold to the purchaser, and he in turn is "sold" if he believes the stuff. This is mainly in answer to sundry inquiries from Los Angeles, Cal., inquirers regarding some recent wonderful allegations as to ability to "see into the earth" by an ingeniously described "metallic indicator." The only trouble such silly statements can make is to cause those to go crazy who haven't far to go, and to cause credulous people to invest money in crazy schemes that can only result disastrously to all except those who sell stock or interest of any kind therein.

On page 506 appears, in the inventor's own language, the most astounding scientific claim of the year. Tesla has been so often "interviewed" that any of those wildly illustrated "scientific" articles in the Sunday papers alleged to be the result of an interview with him are usually productive of hilarity, but in this case the article on page 506 of this issue is the sober statement of Tesla regarding the patent issued to him last week. It is an interesting statement of an improbable possibility.

RAPID and profitable precipitation is claimed for a process in use by the cyanide manager of the Crown Deep mine, Johannesburg, S. A., a modification of the ordinary use of zinc shavings in securing precipitation of the gold from the cyanide solution used in testing slimes. The process specified occasions electrical action through galvanic couples primarily created by dipping the zinc shavings in acetate of lead. During the two months of experiment a percentage of extraction of 91.58 was secured, as compared with a previous percentage of 89.9. The total length of contact is but two and one-half hours, cyanide consumption .3 lb. per ton. Rand journals say that during the two months the profit from the slimes treatment by the new process at that mine was about \$17,000, more than twice the former profit from that source. If this be so, the system will of course be of universal adoption, not only in slime treatment but in sands solutions as well.

Concentrates.

CALIFORNIA miners are impatiently awaiting the fall rains. The Bodie, Cal., *Miner-Index* notes the success of leasers in that section.

COLORADO mining papers prophesy a '98 gold output in that State of \$25,000,000.

The Navajo hoisting works near Tuscarora, Nevada, were recently destroyed by fire.

MONTANA mining papers rightly think that that State should have a mining bureau.

In and around Fort Steele, B. C., the ruling rate of working miners' wages is \$3.50 per day.

MONTANA got the prize offered at the Omaha Exposition for the best State mineral exhibit.

CALIFORNIA's gold yield in '93 was \$12,422,811; in '94, \$13,923,281; '95, \$15,334,317; '96, \$17,181,562.

CINNABAR is reported to have been discovered in the Sevier M. Co.'s property at Gold Mountain, Utah.

An inventor who lays aside his discovery for years forfeits his right to a patent as against another who has obtained one.

No amount exceeding \$10 can be recovered from the U. S. Post Office Department for the loss of any registered package.

The deepest mine from the surface in Colorado is the California mine on Quartz Hill, near Central City, Gilpin Co.,—2200 feet.

SANDON, B. C., silver mines last week deported resident Chinese competitors. A few Chinese prospectors were allowed to remain.

The trustees of Nevada City, Cal., in response to a committee of citizens, donated \$75 to the Nevada County Miners' Association.

LEPIDOLITE was recently noted and described herein. There is a large deposit in San Diego Co., Cal. It is of little commercial value.

JOHANNESBURG, S. A., mill and cyanide men have organized a society, among other objects, to "stamp out and detect gold thieving."

SCIENTIFIC advertising is getting the largest circulation for the smallest amount of money among the class of people desired to be reached.

ANACONDA, Montana, miners offer a reward of \$10,000 for information that will lead to the conviction of the murderer of one of their number on the 8th inst.

An engine developing 100 H. P., with a mean effective pressure of 50 lbs. per sq. in., and a piston speed of 300 feet per minute, requires a cylinder with a diameter of 16.7 inches.

VISITORS to San Francisco from any part of the mining world are invited to consider the MINING AND SCIENTIFIC PRESS office headquarters, where the papers from their several localities may be seen, etc.

The Salt Lake City, Utah, ore sampling companies maintain that the output of the Utah mines will reach a large increase, some of them predicting that it will nearly double in '98 its previous figures.

The Marion Con. M. Co. at Leadville, Colo., owners of claims being worked through the 1400-foot R. A. M. shaft, have received in royalties from the Small Hopes M. Co. the past two years \$269,708.80.

A FUSIBLE PLUG is a threaded brass plug screwed into the shell of a boiler or into a flue, from the inside. It is filled with Banca tin, which melts at 420° F., or a composition metal melting at a still lower temperature.

The British Embassy has invited the U. S. Government to take part in the West Australian International Mining Exposition, which opens next March—a matter of interest to miners and mining machinery manufacturers.

The miner creates the greatest home market; he is no competitor, but a consumer at cash prices. Each underground quartz miner affords employment for ten men above ground. The mining industry patronizes all others and competes with none.

In Toronto, Canada, last week, was paid \$270,000 cash for 100,000 shares of War Eagle, B. C., mining stock. The purchase was not made for speculative purposes but as an investment. The property is paying dividends of 1½ cents a share per month.

A TRADING, mining, prospecting exploiting, land locating company for the Philippines, will shortly start from San Francisco. Several expeditions backed by Australian and English capital are also reported to be preparing exploiting expeditions.

A POWDER is "smokeless" which leaves no ash when burned, but is converted entirely into gases. A little more than 50% of the products of combustion of common black powder consists of solid matter or ash, and it is this solid matter which makes the smoke.

"The principal recent change in telegraphy" is the disuse of the voltaic battery and the substitution of a dynamo or dynamotor. The clippings sent regarding "transmission," "octoplex," etc., are from some imaginative mind, whose possessor could weigh the unexpressed thoughts of an infant.

In California a statute requires "a second mode of egress" by shaft or tunnel from a mine where there is a perpendicular shaft or incline 300 feet in depth from the surface, and where twelve men are daily employed. The tax on the issue of certificates of stock of stock corporations was repealed March 31st, '97.

At 425 California street, San Francisco, is a working model of the Evans hydraulic elevator, to be used by the Risdon Iron Works in unwatering the Comstock. The necessary apparatus is in process of construction and the work of unwatering the deep levels of the old bonanza lode is expected to begin the latter part of next month.

"A few days ago," writes an Eagleton, Oregon, correspondent, "as Major Frank McGee was climbing the side of a mountain near this place, he stumbled and fell. With the superstitious current among old prospectors, he began to dig, found rich float and a few hours later had uncovered, a short distance above, a 4-foot vein of quartz, liberally sprinkled with free gold."

In Colorado the gold ores of Gilpin county, the deeper ores of Leadville and all the mixed ores of the San Juan carry small percentages of copper. In some mines of the last region, notably the Gaston, the iron and copper pyrites alone carry the precious metals. Small as the copper contents are in such pyritiferous ores as the Gaston and some of the Leadville ores, it is sufficient to collect the precious metals in a matte. This

matte, low in copper and rich in iron, is, when roasted by some lead smelters, their most economical flux.

The next meeting of the California Debris Commission to consider applications to mine by the hydraulic process will be held at Room 59, Flood Bldg., San Francisco, on the 28th inst. To date the Board has received 399 applications, of which number 308 have been granted, 82 rejected and 9 remain to be acted upon. Of the entire number nearly all have been on the Sacramento river or its tributaries.

MANY tunnels, run as stock propositions, have been failures, but the economical features of the tunnel run by the practical miner to cut a known vein at greater depths than possible to reach by sinking without expensive machinery, makes it a favorite, popular and successful method of developing a claim, where the rugged features of a section give rapid depth by means accessible to every miner.

FOR 1898 the Director of the U. S. Mint calculates that the gold yield of South Africa will aggregate \$75,000,000; Australia, \$65,000,000; United States, \$60,000,000; Russia, \$30,000,000; other countries, \$45,000,000—a total of \$275,000,000 world's gold yield for the current year. He estimates the Klondike gold output for '98 at \$12,000,000. The world's '97 gold product was \$237,000,000. The Director figures the '99 output at \$300,000,000, a not unlikely event.

J. B. HASTINGS, manager War Eagle Co., Kossland, B. C., keeps an expense account of all workings on that property, figuring everything in detail. Regarding the relative cost of hand and machine drilling, Mgr. Hastings' figures on that subject in elaborate detail show that drifting by hand costs \$35 per foot; machine drilling under similar circumstances, \$17.50 per foot. Underhand stoping by machine works costs \$2.50 per ton; "the old way" \$7.50.

A GOLD PAINT or varnish may be made as follows: (1) Digest shellac, 16 parts, gum sandarac, mastic, of each 3 parts; gum gamboge, 2 parts, all bruised, with alcohol, 144 parts. (2) Pulverize 1 drachm of saffron and ½ drachm of dragon's blood, and put them into 1 pint of 90 per cent alcohol; add 2 ounces of gum shellac and 2 drachms of siccative aloes; dissolve the whole by gentle heat. Yellow painted work varnished with this mixture will appear almost equal to gold.

In this column last week was reported the statement of Supt. Harvey of the Republic mine, Republic, Wash., that in running a tunnel in October he averaged 13 feet per day, which "broke all mining records on the Pacific coast." N. A. Harris considers Mr. Harvey's record a good one, but cites the fact that while he was running the Big Bend tunnel in Butte Co., Cal. (which, by the way, was 12,012 feet in length), in one month—September, '85—he advanced the tunnel 405 feet, running twenty-nine days that month, nearly 14 feet per day. The tunnel was 8x16 feet, a phenomenal record.

At the Abbott Quicksilver mine, Sulphur Creek, Cal., globules of mercury are found in cinnabar rock with some interesting peculiarities. After exposure to the air for a certain time this cinnabar undergoes a transformation. Out of the rock seems to come a growth of silvery white hair, called epsomite. It is one form of crystallization. The hairy substance is 10 to 12 inches long, is very brittle and has a taste similar to epsom salts. It sometimes occurs that a drift through cinnabar rock, when not used for a time, becomes tasseled with this hairy substance and if undisturbed for years becomes almost choked up with it.

LAST WEEK a Salt Lake, Utah, man refused \$250,000 spot cash for a block of 10,000 shares mining stock. When he bought it, it cost him \$7.50 per share; it has since paid forty-seven consecutive monthly dividends of 25 cents each; at present he is receiving \$30,000 per annum on a \$75,000 investment, which is one of the reasons why, in these days of 3% per annum, that stock in a well-managed mine is a sought-for investment. This mine is now in receipt of twenty-five carloads, 500,000 lbs. machinery, over the carriage of which a contest between three railroads for shipment to Park City, Utah, resulted in the job being given the Rio Grande Western.

THERE is a large and steady export movement of tin scrap from the Atlantic coast to Europe. Some of the more extensive works in that line put out from 50 to 100 tons of scrap tin monthly, which, in most instances, is sold to exporters under a yearly contract. It is baled at the factory and shipped to Antwerp, from whence it is sent to a separating works in Holland, where, by a special process, the tin is recovered and made into pigs, while the steel scrap is sold for various purposes. The average value of the tinplate scrap, in bales, delivered at the dock in New York, is about \$5 a ton. Some of the smaller tinware factories, which have no facilities for baling their scrap, dispose of it loose to the manufacturers of sash-weights.

A GOOD FINE CLAY should contain about 45 per cent silica, about 40 per cent of alumina and 13 per cent of water. The best fire clays come from underlying measures of coal, and they owe their freedom from the alkaline constituents found in other clays to having sustained such a luxuriant growth of vegetation as to have had those alkaline constituents virtually sapped from them. Fire clay when first mined is found hard and stony. After exposure to the air it weathers. It is then ground fine, mixed with water and calcine, a previously burnt clay, and some plastic clay to serve as a bond. It is then moulded into fire brick and burned. "Refractory" brick contains 97 per cent of silica, the cement or bond holding this silica together being lime water. In treating a silicate of alumina the assayer has to use hydrofluoric acid or he fuses the material and proceeds with the ordinary analysis.

OSMI-IRIDIUM is a natural alloy of osmium and iridium, and is not infrequent in northern California and other regions. It is usually in small, ragged grains, flat and scaly, is of a bright metallic color, and in washing out gold concentrates with that metal. It is valuable and will find ready sale at the Selby Smelting & Lead Works, 416 Montgomery St., San Francisco. One of the latest uses for osmium, because of its great specific gravity, is as threads, which are to take the place of the platinum wire, and give an exceedingly bright light when the electric current passes through them. A patent thereon has been secured by Auer von Welsbach. The manufacture of these incandescent light tubes consists in covering a thin copper wire with osmium metal and annealing the wire at the highest temperatures. The copper evaporates, while the coating of osmium remains unchanged in the shape of a hollow thread.

LODES are of considerable variety. One may be no thicker than a knife blade, while another may be a hundred feet in thickness. A lode has been defined as a body of mineral or of mineral-bearing rock within defined boundaries in the mass

of rock, or as a continuous body of mineralized rock lying within boundaries clearly separating it from the neighboring rock. The term "apex" does not mean a point. It means the top of the ledge or lode, the point which comes nearest to the surface of the ground. The part from foot wall to the hanging wall at the top of the lode nearest the surface is the apex. As to the relation of the apex to side lines, it has been held that if one has parallel end lines for his claim his right to the lode extends an indefinite extent vertically downward from the end lines, no matter whether the vein crosses a side line or not; but if the apex of the vein crosses both a side line and an end line, the owner has the right to just as much of the lode as he had above.

In the Southern California Railway arrangement in using petroleum for fuel on some of its freight and passenger engines the oil tank holds five tons of oil and is inside the water tank—that is, the water surrounds the oil reservoir. There is 6 feet of water on the back end of the tank, 18 inches on the sides and front and 6 inches on top. It is provided with an oil-tight manhole and has a gas vent, so that any amount of shaking about or even upsetting will not cause the oil to escape. Provisions for safety from fire or explosions are further secured by two automatic safety valves, one on the top and the other on the bottom of the tank. In case of accident breaking loose the tank from the engine, a rope on the top valve and a chain on the bottom one shut the safety valves and cut off the flow of oil instantly, keeping it confined to the inside tank. Two burners are used with two steam jet atomizers, and the fireman controls the whole apparatus by handles within easy grasp.

A RECENT run of ore at the Sierra Nevada mine on the Comstock, Nev., lode deserves notice as compared with wasteful and destructive mill methods in that region heretofore. This crushing was 221 tons; battery assay, gold per ton \$24.00, \$5323.80; silver 10 ounces per ton, 2210 ounces, \$1326; total, \$6648.89. The returns of this ore were: battery cleanings to Selby 550 pounds, less for moisture 61½ pounds; total, 489½ pounds; gross returns, \$509.99; concentrates to Selby 24,720 pounds, less for moisture 2725 pounds, net weight 21,995 pounds; received: silver, 803 22-100 ounces at 60c, \$481.93; gold, 233 367-1000 ounces at \$19.50, \$4550.66; lead, 682 pounds at 3½c, \$23.55; total, \$5058.14. The amalgam from the pans was sent to the mint, from which the returns were: gold, \$395.03; silver, 491 2-1000 ounces at 59½c, \$294; total, \$689.03; chip, \$1.25; total, \$690.28; a total receipt from battery cleanup, \$509.99; from concentrators, \$5058.16; from pans, \$690.28; total, \$6258.43, over 94 per cent of \$6649.29, the battery assay of the 221 tons of ore crushed.

ABOUT the bottom fact now known about gold is that all original pyrites of small grain texture contain gold to a greater or less extent. Of course, this does not cover such secondary large crystal pyritous deposits derived from veins. It is not yet known whether the gold in this pyrites is in chemical combination with the sulphide of gold or whether each minute particle of gold is simply covered with a coating of sulphide of iron, or whether the particles of gold are in the metallic state but alloyed with silver or other metal which combines more readily with sulphur than the gold does, and consequently forms a coat of sulphide of silver over the gold. The particles of gold are so minute, and the combinations follow so rapidly during the splitting up of these pyrites, that the finest instruments and tests known to chemistry have as yet been unable to settle this part of the question to the satisfaction of all concerned, which goes to show how easy it is to put in a mill that will not save the values. If, however, proper caution be exercised, a plant can generally be secured that will give satisfaction without incurring useless expense and discouragement. Considerable money is often sunk in good mining machinery misplaced.

In boilers the proportionate strength of single and double-riveted seams is given by Fairbairn as about 56 to 70. As to why the longitudinal seams in a boiler are double-riveted, while the other seams are only single-riveted, the *Engineer* says this can be determined mathematically in the following manner: The shell of a ¼-inch iron boiler is 44 inches in diameter and the steam pressure is 80 pounds. To ascertain the strain to part the boiler, for 1 inch in length, the diameter should be multiplied by one and by the pressure per square inch—i. e., 80 × 1 × 44 = 3520 pounds. Since there is ¼ inch of metal on the other side, one-half a square inch of the boiler is subjected to a pressure or strain or 3520 pounds; or the total strain on the boiler acting in a longitudinal direction is 7040 pounds. To find the strain on the roundabout seams, the area of one of the heads is multiplied by the boiler pressure per square inch: 3.1416 × 44 = 138.2 inches, the circumference of one of the heads. The area is found to be 3.1416 × 22² = 1520.53 square inches, and multiplied by 80 = 121,642.4 pounds, the strain to part the boiler. To resist this strain there is 138.2 × ¼ = 34.5 inches of metal. This is subjected to a strain of 121,642.4 ÷ 34.5 = 3525 pounds per square inch. This is approximately half the strain to which the boiler is exposed in the direction of the longitudinal seam. It is for this reason that longitudinal seams are generally double and sometimes triple-riveted.

THE marvelous sensitiveness of the telephone, exceeded only by that of the galvanometer, has made it unusually subject to disturbing influences. Coming into public use at about the same time as the electric light, its lines were extended more rapidly at first and many towns had telephone exchanges before electric lighting plants. When the latter were put into operation, the telephone lines theretofore operating in blissful peace and quiet were seriously menaced, as one of their engineers aptly quoted, by a "pestilence that walketh in darkness" and by "destruction that wasteth at noonday." Hardly had the lines been freed from the disturbing influence of the direct current incandescent and the more troublesome arc circuits, when the alternating current system took the field with its widely scattered lines and its wider range of induction, and the way of the telephone manager was thereafter indeed hard. Hardly had the telephone adjusted itself to the new source of disturbance when still another enemy arose in the shape of the electric railway, which, metaphorically speaking, demanded that the telephone should "get off the earth." Many legal battles have been fought with varying success, but the general conclusion seems to be that no one interest owns the whole earth, and that in case of interference the weaker must look out for its own protection. The remedies proposed for obviating and neutralizing telephonic disturbances are many. As early as 1883 there were 200 patents for preventing induction, and the last fifteen years have been even more prolific.

The Refining of Base Lead Bullion Containing Silver, and High in Gold.*

NUMBER III.

By G. H. BLAKEMORE.

The following assays of the crust after it has undergone the liquation process, and assays of bullion made in the retorts from the dry liquated residue will demonstrate this very plainly.

| Liquated Residue First Silver Crust. | | Retort Bullion from Same. | | Retort Dross off Bullion. | |

In comparing the above table, it must be understood that the liquated residues assays represent three-ton samples, the retort bullion assays are made on about 450 lbs., and the retort dross is that actually produced from the bullion shown on the same line, the average quantity produced being about 30 lbs. weight per retort charge.

A careful study of the figures will show the uselessness of attempting to make a silver crust that will be free from gold; therefore, the shortest way out of the difficulty is to simply extract all the silver and gold together, run it up to dore bullion, and part it. Time and money are saved by doing thus, for I have proved to my entire satisfaction that the zinc will not take out the last traces of gold unless the whole of the silver is extracted with it as well.

After the silver and gold is all extracted from the kettle, the desilverized lead is syphoned off into the refining kettle with a 1½-inch diameter iron pipe, with a cast iron plug cock on each end. The syphon is made to fit inside the circumference of the kettle, so that ten minutes or so before it is wanted it is heated by placing it on the molten lead. When everything is ready, the syphon is turned up and filled with lead; both plugs are then closed, and one end of the syphon is passed over the side of the kettle into the launder which is to carry away the desilverized lead into the refining or steaming kettle: the plug on the other end, which is beneath the lead, is opened; then the one outside the kettle. The flow commences at once, and, if not let run too fast, the lead column in the syphon will not break, and in twenty minutes or so the desilverizing kettle will be emptied and ready for a new charge. It is first white-washed, this being done to prevent the zinc alloy from sticking to the side of the kettle.

The gold-silver crust obtained in the desilverizing process is then sent to the liquation furnace for further treatment.

Refining the Desilverized Lead.—As soon as the refining kettle has received all of the lead out of the desilverizing kettle, a movable iron hood is pulled down over it and the fire under it is urged a little. In about four hours the lead is all red hot. It is not advisable to heat the kettle to redness in a shorter time, because the kettles last longer if this heating up is done slowly. As soon as the temperature of the lead in the kettle is high enough to burn zinc, steam, delivered by a ¾-inch pipe, or larger if desired, is then turned on. Care must be taken with this part of the operation, or else some one will get hurt. The steam must be dry and the delivery pipe well warmed up by blowing steam through it. Also, it is advisable to have a drain cock as close to the kettle as it can be put, and this cock is left partly open during the whole of the steaming operation. With these precautions, no water can get into the red-hot lead and dangerous explosions in the kettle, resulting from water suddenly entering the lead, are avoided. It takes the least bit of steam to boil up the lead in the kettle, and care must therefore be taken in turning steam on, or else half the lead in the kettle may be blown out of it. The hood of the kettle has two doors in it, on opposite sides. By means of these doors the lead is stirred from time to time. Pieces of wood are also thrown on the lead to assist in the dezincing process and to keep down the quantity of litharge. In three and a half to four hours the lead will be quite soft and practically free from zinc, if proper care has been taken to keep the temperature to the point at which zinc burns. At this temperature, a cherry-red heat, the zinc in the lead has the power of decomposing the steam, forming zinc oxide, and this, together with lead oxide, which also forms, rises and floats on the top of the lead.

When the test strip of the lead shows that the lead is quite soft and clean, the steam is turned off, the movable hood removed, and the kettle allowed to cool somewhat before the scum of lead and zinc oxides is taken off. A scraper is passed down the side of the kettle to remove any clinging dross. The whole of this skimming is returned to the blast furnaces. After standing an hour or so, the lead has cooled down sufficiently to mold into bars. The tem-

perature should be such that the bar has a nice yellow luster on the face when set. If too cool, the face is white; if too hot, it is a deep blue. It is better to mold the lead too cold than too hot, because at the lower temperature it is more likely to be free from the last traces of copper.

The molding is done with a syphon, as before, the stream of lead delivering into a swinging pipe that lifts up or sideways, as desired. The molds are on wheels and are arranged in a semi-circle at the right distance away to suit the sweep of the swinging pipe. The operation of molding the lead is one that the workman needs a little practice at, to prevent delays through chilling of lead in the delivery pipe. The stream of lead should be kept constantly delivering from the syphon into a cup-shaped receiver on the swinging pipe, the size of the stream is regulated, of course, by a cast iron plug cock. The workman starts by filling a mold from the swinging pipe and then moves the pipe over the next mold. While the second mold is filling, he has a scraper in his left hand (if he is working from left to right, in his right hand if filling the opposite way), with which he gathers all the floating dross off the face of the bar in the first mold while the lead is still liquid. The dross is principally metallic lead formed into bubbles in the passage down the syphon and along the swinging pipe. It does no harm to the lead bar in reality, but spoils its appearance. If the delivery end of the syphon is kept below the level of the lead in the cup end of the swinging pipe, the production of dross is very much decreased. Another man comes after the molder, and, with a chisel-pointed bar, cuts off any pieces of lead which may have splashed over out of the mold. A third man wheels away the mold with the solidified bar in it, and, on tipping it up against the wall, the bar of lead comes out easily and stands on its end. With a swinging pipe 8 feet long about twenty molds will be required on the semicircle. As each mold is emptied, it is run back to its place ready for the next round. Usually the men take turn and turn about at the molding, as soon as a man fills one round he is replaced by another. All scrap lead and skimmings are thrown back into the kettle at the end of each round. Each mold holds about 80 lbs. of lead. The molded lead is now ready for the market.

Coal Used.—For the softening process the quantity of coal necessary depends entirely on the kind of bullion to be purified. An ordinary hard bullion produced from lead ores does not require very much coal, because this class of bullion takes very little time to soften. Hofman speaks of softening fifty tons of such bullion in six hours. I have had a 15-ton charge forty-seven hours in the furnace before it was softened. It is, therefore, difficult to give any set weight of coal as being the right amount to reckon on. The consumption depends on two things: the impurities in the bullion and the size of the plant. Working on very dirty bullion in a plant with 15-ton softening furnaces, the coal consumption in pounds per ton of unsoftened bullion may be taken as follows:

| | Pounds. |
|--------------------|---------|
| Softening..... | 180 |
| Desilverizing..... | 60 |
| Steaming..... | 40 |

The bullion that consumed this amount of coal produced 304 lbs. of softening skimmings from every ton of the unsoftened bullion, which will probably give an idea of its impurity. I have treated bullion producing 600 lbs. of skimmings per ton of unsoftened lead, but this bullion was exceptionally dirty.

The same dirty bullion worked in 50-ton furnaces and desilverized in 30-ton kettles would, of course, require considerably less coal to get the same work done, so it is plain that no set figures can be given to suit all the conditions met with in different works.

Life of Kettles.—This is also very uncertain. Those used in the desilverizing work last considerably longer than those used in the steam refining work. But in either case it is possible for a kettle to break during the first charge, or it may last for 10 charges. Good steel kettles are superior to cast iron, if they can be obtained, but it is a very difficult matter to make a good sound steel casting of the size of a lead kettle. The kettles I have used have been of steel of fourteen tons capacity, and they have stood over sixty charges each, both at desilverizing work and refining work, and, with the exception of pinholes that have appeared in the steaming kettles, the kettles are apparently as sound as ever. The pinholes were bored out, tapped and plugged, making a good, sound job. Naturally, the steaming kettles go first, because of the much greater wear and tear on them with the constant agitation of the lead and the temperature the lead is raised to in them. The best method to insure good kettles is to buy them on a contract, and agree to pay the iron founder so much a charge. If they break at the first charge the kettle costs you nothing, and if they last you 100 charges the kettles may cost you £50—but they have been worth it. It is really the only way to make sure of the best metal being put into the kettles, and even if the kettles in the long run cost a little more, still money is saved in the avoidance of the delay occasioned every time a broken kettle has to be lifted out and another put in place.

Zinc Used in Desilverization.—For 1775 tons of un-

softened bullion, 20.05 tons of virgin zinc and 8.09 tons of zinc recovered from the retorts were used, a total of 28.14 tons. This is equal to a consumption of virgin zinc of 1.13%, or, counting in all the zinc used, 1.59%. The average assay of the bullion was 14 ozs. gold, 131 ozs. silver per ton.

If an attempt is being made to extract the gold with as little silver as possible, the following general table will give the result of my experience in zinc consumption:

| Tons Lead in Kettle. | Total Gold in Kettle. | 1 Lb. Zinc Will Take Out. | |
|----------------------|-----------------------|---------------------------|---------------------|
| | | Au. Ozs. | Ag. Ozs. |
| 11 tons. | 300 ozs. | 1.30 | and 1 to 3 with it. |
| 11 " | 250 " | 1.00 | " 1 to 3 " |
| 11 " | 150 " | 0.75 | " 1 to 3 " |
| 11 " | 100 " | 0.50 | " 1 to 3 " |
| 11 " | 60 " | 0.45 | " 1 to 3 " |

Silver zincing gives the following general results:

| Tons in Kettle. | Total Silver in Kettle. | 1 Lb. Zinc Will Remove. Ag. Ozs. | Assay Per Ton of Lead After Zincing. |
|-----------------|-------------------------|----------------------------------|--------------------------------------|
| 11 | 1380 | 5.3 | 2.08 |
| 11 | 1450 | 5.6 | 3.44 |
| 11 | 1200 | 4.1 | 4.78 |
| 11 | 1110 | 3.9 | 0.70 |
| 11 | 775 | 3.5 | 0.69 |
| 11 | 930 | 3.8 | 1.59 |
| 11 | 616 | 3.4 | 0.54 |
| 11 | 560 | 3.2 | 1.70 |
| 11 | 1850 | 2.6 | 0.54 |
| 11 | 132 | 1.1 | 0.40 |
| 11 | 55 | .55 | nil. |

Results obtained when taking out all the gold and as much silver as possible in the first zinc:

| Tons in Kettle. | Total Contents in Kettle. | | 1 Lb. Zinc Takes Out. | | Assay Per Ton of Kettle After First Zinc. | |
|-----------------|---------------------------|------|-----------------------|------|---|-------|
| | Au. | Ag. | Au. | Ag. | Au. | Ag. |
| 11 | 494 | 3110 | 0.59 | 3.60 | nil. | 10.04 |
| 11 | 194 | 1663 | 0.34 | 2.83 | nil. | 3.88 |
| 11 | 296 | 1934 | 0.45 | 2.95 | tr. | 17.46 |

(To be Continued.)

The Present Conditions of Gold Mining in the Kochkara Region in the Oural.

NUMBER III.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by R. HELMHACKER, Prague, Bohemia.

The first reduction of the ores is done with a plant of jaw-crushers and afterward with crushing rolls. The vein stone, reduced to nut size, is conveyed on an endless belt with baskets to the third story, where it is thrown, passing meanwhile an inclined screen to another crusher, where it is granulated to the size of barley. These finer granulated savings, to which are added those which passed the screen, are crushed in chilled cast iron rolls to sand-like size. All these apparatus are connected with a succession of intermediary rotating drum sieves, by which the coarser sized particles are returned to the crushing rolls, while the fine grindings are fanned through tubes by means of a ventilator in a dust or grinding room, all these being conditions promoting uniformity of pulverization. The sizing drums alluded to are lined with copper screens with meshes, and then with punched or perforated sheet iron, exhibiting twelve meshes in the length of 1 centimeter. Thus the size of the grindings is ½ mm. The powdered stuff is then fed into a narrow trough with an Archimedian screw, which, when turned in one direction, conveys the stuff into a funnel and onto a small car on a rail track connected with the reverberatory roasting furnace. This is the case if the ore is high-grade in sulphurets, to be treated in the extracting plant without any further concentration. If the powdered vein stuff is of low grade in its content of auriferous sulphurets, it is conveyed, by setting the screw in opposite motion, into a deep mixing trough, where it is mixed with water. The powdered stuff with water flows as a turbid current through contrivances to intercept the free precious metal, and over gently sloping sluices covered with copper amalgamating sheets; and from them the disengaged suspended sediments in the water current are conducted on the rubber belt of vanners, where the tailings are concentrated to sulphurets and to waste. The copper amalgamating plates which caught the free milling gold are scraped of the accumulated gold amalgam and the sulphuret concentrates, which are to be treated chemically, are put with the roasting stuff.

All the plant, such as crusher and the succession of concentrating contrivances, with a daily treating capacity of fifty tons of vein stuff, was made in Eng-

land and is run by a 50 H. P. compound steam engine.

Other mills treat the friable vein stuff more simply. The vein stuff to be treated is put directly into the Chilean arrastras, in which is added some mercury, where it is crushed by the mullers to sand or to slime. The turbid current is then lead over the copper amalgamating plates to catch the free gold, and is then concentrated to sulphurets.

As already alluded to, the mill tailings from which the gold has been caught by dressing and amalgamation were heaped on tailing dumps as waste; but since the year 1886 they have been treated chemically. Now the old (not concentrated) tailings, regarded as waste, as well as the high-grade sulphuretted ores in pulverized form and the concentrates, are lixiviated; but first they are roasted to drive off the sulphur and arsenic—if not entirely so, to the greatest possible extent—and to oxidize the metallic bases, so as to obtain a product containing particles of free Au in the highest possible division. The first roasting furnace to treat the tailings had no flue-dust chambers, and had only a capacity to treat six tons of ore in twelve hours.

The present reverberatory roasting furnaces are two-staged, 15 m. long, 4 m. broad, with nine working holes on either sides. The bottom of the roasting furnace is made of talcstone. The ore is filled in at the furnace end on the opposite side of the fire room, through a funnel, to which the charges are brought in a car by a lift. In twenty-four hours 67 to 99 tons of tailings or concentrates can be roasted. Before the gases and fumes of As_2O_3 reach the chimney they pass through flue-dust channels 118 m. in length, where the dust and the As_2O_3 are condensed. The roasted mass is spread on the paved cooling mill floor and then sent to an elevator, which discharges it into the third or lixiviating story.

As one began to treat the roasted ores by lixiviation all methods proved unsatisfactory except the Plattner one of chlorination, which was still modified. The cooled roasted ore was run through funnels into boiler plate cylinders, coated inside with sheet lead, in charges of 16½ tons, from which daily (in twenty-four hours) 4 or 5 tons can be chlorinated. These rotating cylinders have a gas-tight, screwed lid. The ore within the cylinder is mixed with hypochlorite of lime and sulphuric acid, by which the disengaged chlorine gas unites with the Au to form soluble Au_2Cl_3 . The chlorinated content of the rotating cylinder is let out into a tank, then rinsed with water. The liquor in the settling tank is allowed to settle for four hours, and, when cleared enough, elevated through a lead pipe into other precipitating vessels or basins, either of wood or glass, to precipitate the Au from the gold-chloride solution. It is alleged that the precipitation of the gold with charcoal was not satisfactory, while the precipitation of gold metal with iron sulphate in wooden tanks, or of gold sulphite with sodium sulphite into glass balloons, gave good results.

But, besides this method, other modifications of it were tried, thus: to roast the ore in chlorinating manner with some salt, or to introduce the chlorine gas formed in an extra apparatus through lead pipes directly into a tank with the suspended roasted ore, or through a false bottom, and other treatments with other agencies, some of which are too slow or uncertain in their operation and others altogether conjectural.

In the roasting mill is a melting furnace to fuse the gold bullion and a muffle furnace for tests, in which 100 kg. stuff can be treated.

Some of these new methods, though they are theoretically well founded, gave no good results, as there were no trained engineers to handle these processes. From 1886 to 1895 were extracted, mostly from the dumped tailings, 497.2 kg. gold, in the extraction mill of the Russian mining engineer, Zelenkov, who first introduced this lixiviating process into Russia.

It would be of great interest to know exactly how much of the chemically bound gold contained in the tailings can be lixiviated by the chlorination method, and how much, on an average, rests in the water unextracted.

To lixiviate the tailings of other mining properties the first promoter of this chlorination method formed a company under the title, "The Russian Works for Chemical Extraction of Gold;" but as the new works were ready to operate the Government made trouble for them, as the Russian gold mining regulations prohibit one gold miner from selling his product to another gold miner. Therefore the company, to escape this point, was obliged to lease the mines, with their tailing dumps, and expressed a desire to have the tailings lixiviated. Thus the same thing, in spite of the mining regulations, was permitted.

In the meantime the cyanide process was introduced to recover the gold from tailings. The gold in the solution is precipitated with zinc shavings. In 1897 one of the largest producing mines was bought by a French-Belgian society for the somewhat high price of 3,000,000 francs, and this stock company is now erecting a great cyanide-lixiviation plant for treating the tailing dumps, with electrical precipitation of the gold in solution. It is expected to have the plant in operation the present year.

Temperature of Battery Water.

Written for the MINING AND SCIENTIFIC PRESS.

Some millmen claim the battery water in stamp mills may be ice cold without detriment to amalgamation. The greater number, however, seem willing to admit that a temperature of between 60° and 70° F. is best for amalgamation, but will deny that warmer than this is desirable. During the past two years the writer has had opportunities of noting some of the results of using warmer water, and submits a few of his observations, hoping some of them may find time and opportunity for making a thorough investigation of the subject by careful and conclusive experiment.

In one mill, of which we know, where the temperature could be readily changed from ice cold to hot, a saving of 90 per cent was effected with water of about 80°, as against a saving of 80 per cent with the water at about 60° under otherwise similar conditions. The use of water warmer than this was not attempted. The ore carried iron pyrites and some galena, which was concentrated on Frue vanners. For some reason unknown to the writer, the concentration seemed to be improved by using the warmer water. Battery amalgamation was practiced, the chuck blocks as well as the apron plates being cleaned up each twenty-four hours.

I noticed the warmer water seemed to increase the greenish film of oxide of copper on such portions of the plates as it appeared. At the same time the percentage saved in the battery was increased, which would partly account for it, less gold coming out on the plates to help it down; still this oxidization was probably increased somewhat by the warmth of the water. The mercury squeezed from amalgam carried more gold in solution than usual. After being cleaned with dilute nitric acid and cyanide of potassium, this mercury was used in the batteries and on the plates on account of it not draining off the plates as readily as that retorted. In dressing the plates the amalgam was left as stiff as it could be well worked with the broom, in order to overcome this difficulty. During cold weather a dribble of the warm water was allowed to pass over the plates while dressing them to keep it soft. The most striking instance, however, of the use of warm battery water was found at the mill of the Virtue mine, near Baker City, Oregon. The water left the lower levels of the mine at a temperature of 120°, and by the time it reached the batteries it was not less than 90°.

This was somewhat of a compulsory test of warm water, as there was none cooler available, and comparative results were not to be had. The following facts, however, of which we are credibly informed, make a very satisfactory showing: The ore milled from \$10 to \$25 per ton, the average for the year being about \$12. The tailings assayed from 40 cents to \$1 per ton, very seldom exceeding the latter figure, and only when milling unusually rich ore. The average assay of the tailings did not exceed 60 cents, showing a saving of 95 per cent, which was very good, especially as the ore, though considered free, carried a fair percentage of iron pyrites.

These were concentrated on vanners, much overloaded the greater part of the time. The twenty stamps, of 850 pounds each, crushed about sixty tons per twenty-four hours. As high as 90 per cent of the gold saved was found in the batteries—an unusually high percentage. There was much less mercury fed per ounce of gold than would have been required with colder water. The amalgam in the battery and on apron plates was kept quite hard, having a frosty appearance similar to that on the back of a mirror. To one accustomed to the usual appearance of amalgam on plates it seemed much too hard, but we were assured the best results were thus obtained, the mercury draining off the plates when it was softer. In his work on stamp milling of gold ores, T. A. Rickard mentions a mill in Australia in which warm battery water was used, accompanied by a less loss of mercury than in a neighboring mill using water at ordinary temperature, which would not be cold in that country. He attributes the difference to the lime used to take up the grease in the water condensed from the exhaust steam of the engine, which was allowed to mingle with the battery water. (We quote from memory.) While he is a close observer and usually draws correct conclusions, we are inclined to believe that at least a part of the difference was due to the temperature of the water. He also mentions placer miners in the mountains of New Zealand who claim their gold will not readily amalgamate in cold weather. This seems also to be the almost universal opinion of Snake river placer miners, some using burlaps in winter and amalgamated plates in summer for this reason.

In view of these facts, we may perhaps be permitted to briefly theorize upon the subject. Most chemical combinations are assisted by heat. We note the cyanide men are giving more attention to this fact. It may be objected that amalgamation is more in the nature of an alloy. Admitting this, gold being readily dissolved in molten lead would seem to favor the use of warmer mercury amalgamation. In making sodium amalgam it is necessary to heat the

mercury to assist the amalgamation or alloy of the two metals.

The amalgamation of gold is analogous to these processes. The surface of the gold being slightly dissolved by the mercury at ordinary temperatures, the process would naturally be assisted by heat. The greatest objection to its use seems to be the tendency of the mercury to drain off the plates on account of being thinner. This may be met, as at the Virtue, by keeping the amalgam harder. Mercury squeezed from the amalgam may also be used with advantage, provided it is not sickened by base metals or sulphur in the ore. In any case it would probably be better to clean it with acids at least before using. It is possible that ores carrying a higher percentage of sulphurets than in the above-cited instance (which was about 1 per cent) might sicken the mercury and cause loss in that way, but we have observed nothing which would support such a natural conclusion. Probably this difficulty would not appear save where an excess of mercury was present. We venture to conclude, however, that the use of battery water of a temperature of not less than 80° F. is helpful to amalgamation on free gold ores or those carrying sulphurets up to say 1 per cent. Further than this we leave to be determined by future experiment.

MINE SUPERINTENDENT.

Baker City, Or., Nov. 6th, '98.

English and American Methods.

There is material difference between American and English methods in furnishing account sales in copper purchases. Following are copies of two actual transactions; the first is from England:

The multiplied and complicated charges in the English system are noticeable. English smelters at a recent conference recognized this and propose to modify their standard terms for treating copper furnace material. They will abandon the "miner's

ton" of 2880 pounds and the draft. They retain the returning charge on silver, but have reduced this 6d. to 2s. per unit of copper and have agreed to buy at a price per unit of copper by assay. These changes will simplify English invoices and bring their terms of sale nearer to the simpler and more satisfactory American system.

The Reduction Works for Silver Ores at Aduana, Sonora, Mexico.*

M. TR. ARMAS.

Sulphides.—Twice a week all the accumulated sulphides are thrown upon a cloth filter in a vat with a false bottom, and dried. The sulphide is calcined in a reverberatory furnace at a very low temperature, and then incorporated in the cupellation with litharge. 11.75 pounds of sulphide treated with lime and boiled with steam for an hour gave 54 liters calcium polysulphide solution of 2° B. with 5.380 grams of sulphur per liter; the residue was incorporated in the cupellation without any difficulty, any excess of lime in the remaining sulphide coming out of the cupel with the litharges.

Concentration of the Copper in the Leaching Waters.—Experiments proved that the free iron, always found in mattes of lead smelting, would easily precipitate the copper found in the solution as chloride or sulphate, besides the silver that it may contain. Furthermore, the mattes were to be exported, provided they contained a sufficient amount of copper to pay the expense of freight and duties, the real profit coming from the silver contained in them. It was decided to enrich the mattes destined for exportation by allowing all the leaching waters to pass over them. The results were satisfactory, as mattes of 35 per cent of copper could be enriched to 40 per cent.

Concentration.—During the last half of 1897 we treated 2380 tons of ore, containing 65,321 ounces concentrates; obtained 410,972 pounds, containing 48,768 ounces concentrates. Cost per ton of ore treated:

| | |
|-----------------------------|-------|
| Labour in crushing | 80 \$ |
| Crushing | 87 |
| Labour at the concentration | 84 |
| Store expenses | 24 |
| Machinery, pumps, etc. | 58 |
| Total | 333 |

Smelting.—All the ores of a grade superior to 130 ounces per ton, as well as the concentrates, are smelted in a water-jacket furnace of the following dimensions:

| | |
|------------------------------------|---------------------|
| Diameter | 36 in. |
| Capacity | 40 T. |
| Number of tuyeres | 6 |
| Boiler pressure | No. 4 |
| Blow pressure | 4-1/2 in. |
| Number of revolutions per minute | Between 100 and 125 |
| Volume of air taken per revolution | 15 cubic feet |
| Diameter of blast pipe | 14 in. |

As we go deeper in the mine the ore is becoming more bluish. The concentrates are rich in zinc. No roasting of the ore could be done successfully as the losses in silver by volatilization were great, as is the case with rich ores.

For the zinc there was only one remedy in ordinary smelting, that of fluxing it with a large amount of slag. Slag containing more than 5 per cent of Zn did not give satisfactory results, but a large amount of slag, cost in fuel, time and iron, neither of which is cheap. On the other hand, as we had to contend with Indian unskilled workmanship, we were liable to be the victims of their carelessness, especially with ores containing such a large percentage of Zn and As.

The speiss formed (As, Fe) is not readily fusible and not liquid when melted, forms scum-like accretions, and prevents a good separation of lead. To prevent this it is necessary to select a slag that requires a great heat for the formation, and fuel is dear in Aduana. Furthermore, any neglect on the part of the Indian at the tap-hole, for instance, by not keeping it in the proper level and nearer to the hottest part of the furnace, is liable to cause the speiss floating on the lead beneath the matte to chill. The scarcity of iron ore and fuel, and the accidents mentioned above, compelled us to resort to matte smelting with as little flux as possible, trying, however, to obtain all the silver in the base bullion as long as the hearth was kept in good condition.

By operating in that manner we could get rid of the greater part of Zn and As. In the second operation, re-smelting the mattes, most of the lead and silver were recovered and the mattes themselves reconcentrated to about 40 per cent of copper, which would pay very well to export.

In direct smelting, causing accidents and the large consumption of fuel, about 26 per cent, to say nothing of the losses to silver by volatilization, the cost was greater than by smelting first for mattes and then re-smelting the same. Indeed, the latter required a lower temperature, was easier to smelt and did not cause important volatilization of silver.

The consumption did not exceed 23 per cent in both operations together.

In direct smelting, when it was attempted to extract the greater part of the silver, the matte could not be exported at a large profit. The figures below indicate the composition of mattes by the first and second methods of operation:

| DIRECT SMELTING. | | |
|------------------|-----------------|----------------|
| Mattes. | Per Cent. | Per Cent. |
| Cu | 35.0 | 27.5 |
| Pb | 38.1 | 27.9 |
| Fe | 12.9 | 15.1 |
| S | 22.7 | 30.9 |
| As | 5.3 | 4.8 |
| Ag | 27.5 oz. per T. | 168 oz. per T. |

BY THE METHOD OF SMELTING FIRST FOR MATTE.

| | Per Cent. | Per Cent. |
|----|-----------------|----------------|
| Cu | 42.8 | 41.9 |
| Pb | 21.6 | 21.4 |
| Fe | 9.2 | 10.1 |
| S | 22.1 | 23.4 |
| Zn | 3.0 | 1.9 |
| Ag | 97.5 oz. per T. | 130 oz. per T. |

No automatic separation of slag and matte was made. The slags did not carry more than 1.3 ounces per ton. The charge was prepared in stalls, in thin alternating beds, so as to insure a more nearly perfect mixture of the ore and fluxes. The charcoal was of mezquite wood and could stand well the crushing effect of the charge. Its price varied from \$2.50 to \$2.75 per 300 pounds. Iron ore cost from \$1.25 to \$1.75 per cargo of 300 pounds.

Cupellation.—For the extraction of the silver from the base bullion and the sulphides from the lixiviation, no modern methods could be applied on account of the local conditions and because of the first expense, which the company would not permit. Cupellation is an effective process, and the Mexicans are experts in handling it. The loss in silver did not exceed 0.7 per cent. We use the English cupel; dimensions: 46x59 inches. The lining was made of a mixture of limestone and decomposed rhyolite, in the proportion of 100 of the former to 46 of the latter.

Each cupel necessitates 1,379 pounds of the mixture, which was moistened very slightly and passed through a No. 4 mesh screen. The tamping is done by proceeding from the center in the form of a spiral. The circular indentations should overlap in part. At Aduana the tamping was done on a great number of layers. The cupel, once in place, is heated very slowly so as to avoid cracking, and towards the end, that is, after forty-eight hours, heated intensely and varnished with litharge, when it is ready for charge. The sulphides of silver are incorporated in the lead bath with twice as much litharge. The base metals and foreign matter of the base bullion are carried away by the litharge and the skimmings. Some of the copper, however, remains until the last moment, and only comes out with the last litharge, which is very rich, and, as a rule, is re-refined and treated in the cupellation.

Two tuyeres furnish from a small ventilator the blast at a pressure of 7 ounces per square inch.

The capacity of a cupel is 3,500 pounds. The duration of a cupel is forty days, if managed carefully.

| | |
|---|----------------|
| Losses in silver | 10.7 per cent. |
| Consumption of wood per twenty-four hours | \$7.50 |
| Labour per twenty-four hours | \$2.50 |
| Cost of cupellation per ounce of silver | 388 |

As the mint of Alamos accepted bars of silver with 955 fineness, we never tried to pass 992; the average, though, was 990. Our monthly production in fine silver could be increased considerably, since the construction of two more reverberatory furnaces was effected.

Mr. Dorton conceived the idea of the utilization of the bed of the river, which is dry most of the time, as a filter for all the water coming from the reduction works. A mile from the reduction works a well was dug, and the waters accumulated there. An electric pump pumped the water back, and thus the concentration could go on almost all the year without interruption. These two facts ought to increase the production considerably, if everything is managed skillfully.

During the year 1896 the cost of 1 ounce of fine silver can be stated as follows:

| | Per Cent. |
|---------------------------------|----------------|
| Cost in mining | \$ 321 or 35.0 |
| Cost in smelting | 286 or 25.4 |
| Cost in administrative expenses | 75 6.9 |
| Profit | 333 30.7 |
| Total | \$ 1015 100.0 |

Tesla's Latest Claim.

Following is a verbatim statement from Nikola Tesla, in his application for a patent which last week was issued to him:

The problem, for which the invention forming the subject of the present application affords a complete and practicable solution, is that of controlling from a given point the operation of the propelling engines, the steering apparatus and other mechanism carried by a moving object, such as a boat, or any floating vessel, whereby the movements and course of such body or vessel may be directed and controlled from a

distance, and any device carried by the same, brought into action at any desired time.

So far as I am aware, the only attempts to solve this problem, which have heretofore met with any measure of success, have been made in connection with a certain class of vessels, the machinery of which was governed by electric currents conveyed to the controlling apparatus through a flexible conductor. But this system is subject to such obvious limitations as are imposed by the length, weight and strength of the conductor which can be practically used, by the difficulty of maintaining with safety a high speed of the vessel or changing the direction of movement of the same with the desired rapidity, by the necessity for effecting the control from a point which is practically fixed, and by many well understood drawbacks inseparably connected with such a system.

The plan which I have perfected involves none of these objections, for I am enabled by the use of my invention to employ any means of propulsion, to impart to the moving body or vessel the highest possible speed, to control the operation of its machinery and to direct its movements from either a fixed point or from a body moving and changing its direction, however rapidly, and to maintain this control over great distances, without any artificial connections between the vessel and the apparatus governing its movements, and without such restrictions as these must necessarily impose.

In a broad sense, then, my invention differs from all of those systems which provide for the control of the mechanism carried by a moving object and governing its motion, in that I require no intermediate wires, cables or other form of electrical or mechanical connection with the object, save the natural media in space. I accomplish, nevertheless, similar results, and in a much more practicable manner, by producing waves, impulses or radiations, which are received through the earth, water or atmosphere by suitable apparatus on the moving body and cause the desired actions, so long as the body remains within the active region or effective range of such currents, waves, impulses or radiations.

The many and difficult requirements of the object here contemplated, involving peculiar means for transmitting to a considerable distance an influence capable of causing, in a positive and reliable manner, these actions, necessitated the designing of devices and apparatus of a novel kind in order to utilize to the best advantage various facts or results which, either through my own investigations or those of others, have been rendered practically available.

As to the part of my invention which involves the production of suitable waves or radiations and the conveying of the same to a remote receiving apparatus capable of being operated or controlled by their influence, it may be carried out in various ways which are at the present time more or less understood. For example, I may pass through a conducting path, preferably enclosing a large area, a rapidly varying current and by electro-magnetic induction of the same, affect a circuit carried by the moving body. In this case the action at a given distance will be the stronger the larger the area enclosed by the conductor and the greater the rate of change of the current. If the latter were generated in the ordinary ways, the rate of change, and consequently the distance at which the action would be practically available for the present purpose, would be very small; but by adopting such means as I have devised, that is, either by passing through the conducting path currents of a specially designed high-frequency alternator, or better still, those of a strongly charged condenser, a very high rate of change may be obtained, and the effective range of the influence thus extended over a vast area, and by carefully adjusting the circuit on the moving body so as to be in exact electro-magnetic synchronism with the primary disturbances, this influence may be utilized at great distances.

Another way to carry out my invention is to direct the currents or discharges of a high-frequency machine or condenser through a circuit, one terminal of which is connected directly or inductively with the ground and the other to a body, preferably of large surface and at an elevation. In this case if the circuit on the moving body be similarly arranged or connected, differences of potential on the terminals of the circuit, either by conduction or electrostatic induction, are produced, and the same object is attained. Again, to secure the best action, the receiving circuit should be adjusted so as to be in electro-magnetic synchronism with the primary source as before, but in this instance it will be understood by those skilled in the art that, if the number of vibrations per unit of time be the same, the circuit should now have a length of conductor only one half of that used in the former case.

(To be Continued.)

A curious state of things is said to have been observed in investigating the electrolysis of water pipes in Dayton, Ohio. It was found that stones and pebbles near the pipes in some cases seem to have been electroplated with the metal of the pipe, which one of the experts believes has never been observed before.—Electrical Review.

* Condensed from Journal Franklin Institute.

Coast Industrial Notes.

—Kittitas county, Wash., shipped 60,000 sheep this year.

—Among the imports from Hawaii last week were 19,332 bags of sugar.

—Over 20,000 boxes of oranges were shipped from Riverside, Cal., last month.

—The Los Angeles Co., Cal., exhibit at the Omaha Exposition received ninety-nine prizes.

—Forty-five carloads of goods have been shipped from the Pomona, Cal., cannery this season.

—The Great Northern Railway will build sixty miles from Bonner's Ferry, Idaho, to Nelson, B. C.

—At Anacortes, Wash., two canneries put up 24,000 cases of salmon this season, and at Fairhaven two firms put up 24,000 cases.

—The Southern Pacific Co. will rebuild the departments of its manufacturing plant at Sacramento, Cal., recently destroyed by fire.

—The Inland Co. has completed its telephone line into Northport, Wash., making it possible to send one's voice to San Francisco, a distance of 1,400 miles.

—The Pine Manufacturers' Association has again raised the price of lumber \$1 per M. feet, the reason given being the advance in logs on Puget Sound.

—The Santa Fe has secured a water-front freight terminal in San Francisco, the block bounded by Spear, Main, Harrison and Bryant Sts., at a cost of \$300,000.

—Three carloads of lumber and machinery have arrived at Johannesburg, Cal., for the California Borax Co. that is erecting works at Borax lake. They propose to erect a plant capable of turning out 100 tons of refined borax a day.

—California will produce more beet sugar in '99 than ever before in a year. The Union Sugar Company at Santa Maria and the Huemene factory will each use 1000 tons of beets daily; Spreckels' factory at Salinas, 3000 tons; the Los Alamos factory near Los Angeles, 700 tons; the Crockett factory 500 tons a day.

—J. A. Flicher of the Cal. State Board of Trade has a letter from the managers of the Commercial Museum, Lisie, France, offering free space and free care of any non-perishable products of California. The idea is to make a perpetual exhibit in that city of every unperishable article that can be produced in California.

—A rush of work is reported on the New Mexico divisions of the Santa Fe and on the whole of the Santa Fe Pacific. All the rolling stock at Albuquerque, Las Vegas and Raton is on the move, and double the present amount could be used to advantage. The road has given rush orders to hurry the completion of thirty new locomotives. The road is also short of freight cars at many points between El Paso and Topeka. The volume of freight and passenger business is greater than ever before at this season.

—Direct communication between South American markets and San Francisco will soon be established by a large French steamship company. The Chargeurs Reunis will start a monthly service next March between San Francisco and Liverpool, which will make stoppages at Mazatlan, Acapulco, Guayaquil, Callao, Peru; Valparaiso, Chile; Montevideo, Uruguay; Santos, Brazil; Liverpool, Havre and possibly a Belgian port. The company has been organized and operated since 1873, and is now having constructed three 6000-ton additional steamers for the Pacific trade.

—Next week the water will, for the first time, be turned into flumes and tunnels of the Southern California Power Company in the Santa Ana canyon, Cal. The plant has been two years in building, and has cost \$500,000. There are three and one-half miles of tunnels through solid granite mountains, and two miles of fluming. In this distance a fall of 75 feet is secured, and the water is conveyed from the canal line to the power-house in 30-inch steel pressure pipe 2000 feet long. A pressure of 310 pounds to the square inch is developed. This is turned on water wheels in the power-house. There are four connected directly with the generators. Each complement of machines is capable of developing 100 H. P. Electricity of a voltage of 33,000 is sent over the copper wire to Los Angeles, eighty miles away—the longest transmission of electricity in the world.

Personal.

J. SHAW is appointed Supt. Stanley mine, Jacksonville, Cal.

W. E. COUL is Supt. Philadelphia gravel mine, Columbia, Cal.

R. B. HARPER is Supt. Santa Clara Q. S. mine, San Simeon, Cal.

D. MOORE, Supt. Culbertson mine, Graniteville, Cal., is in San Francisco.

P. LANGDELL has been appointed Supt. Eureka mine at Middle Creek, Cal.

MAJOR A. G. METERS, a mine owner of Yreka, Cal., is in San Francisco.

C. B. WINGATE has returned to San Francisco from his mines at Dedrick, Cal.

GEO. BLAKE, a mining superintendent from Tuttletown, Cal., is in San Francisco.

CAPT. RICHARD A. PARKER has returned to San Francisco from Grant's Pass, Or.

S. NEWHOUSE has returned to Salt Lake City from his mining properties in Mexico.

P. G. GOW, Gen. Mgr. Jumper M. Co., San Francisco, has returned from Dedrick, Cal.

L. G. STEVENSON succeeds A. E. Dawson as Supt. Hearst mines, Santa Rita, New Mexico.

O. L. BARTON, Supt. Herman mine, Deadwood, Cal., has returned from San Francisco.

At a recent meeting of the San Francisco Co., Cal., Miners' Association, Julian Sonntag

was elected president and Chas. G. Yale secretary.

W. R. WOODWARD has been appointed Gen. Mgr. Barstow Reduction Works, Barstow, Cal.

E. K. STEVENSON of San Francisco has been examining mining properties in Shasta Co., Cal.

S. W. CHEVNEY, Gen. Mgr. Garfield Con. mines, Whitehouse, Cal., has returned to San Francisco.

D. M. DE LONG, managing owner DeLong M. Co., Oroville, Cal., has returned from San Francisco.

D. H. JACKSON, Gen. Mgr. Gold Bug M. Co., Placerville, Cal., has returned from San Francisco.

W. H. THOMAS, Mgr. Niagara mine, Bingham, Utah, is on his way from New York to San Francisco.

J. SONNAT, Secy. Cal. State Miners' Association, has returned to San Francisco from Nevada City, Cal.

W. P. HAMMON is elected Pres. Butte County, Cal., Miners' Association at Oroville and A. Ekman Treas.

E. L. BARNES, owner Falls mines Igo, Cal., passed through San Francisco on his way home from Pony, Mont.

C. E. LANGE, Mgr. Grand Central mine, Mammoth, Utah, is in San Francisco. He accompanies Mrs. Loese, who is in poor health.

J. T. DANNEHLAN has resigned as Supt. Boston & Methuen M. Co. of Twisp, Wash., to take a like position with the Black Warrior Copper Co. of Globe, Ariz.

At Nevada City, Cal., last week, F. Zeitler was elected Pres., G. Mainhart Vice-Pres., and W. F. Englebright Sec. of the Nevada County Miners' Association.

J. FETZ of San Francisco, Vice-Pres. Champion M. Co., Nevada City, Cal., is on his annual visit to the several mining properties in which he is interested in that locality.

A. M. McDONALD, Supt. Kanaka mine, Groveland, Cal., is in San Francisco. Mr. McDonald was elected recently to represent Tuolumne county in the State Legislature.

PROFESSOR VON OSTINGEN of Leipzig, Germany, has received official permission to go to the Transvaal to investigate the suitability of electric methods for the extraction of gold in the Johannesburg district.

MR. FRANK E. SHEPARD and MR. LEWIS SEARING, who for many years have been associated together, have assumed control of the Denver Engineering Works Co., Denver, Colo., manufacturers of mining, milling and smelting machinery. Mr. Shepard is a graduate of the Massachusetts Institute of Technology, member of Am. Soc. Mech. Engs. and member Am. Soc. Min. Engs., and will act as president and treasurer, and will also act as superintendent of the works. Mr. Searing, who is a graduate of the Stevens Institute of Technology, a member of Am. Inst. Elec. Engs. and a member of Am. Soc. Mech. Engs., will occupy the position of vice-president and general manager of the company.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MASSAGE MACHINE.—Dr. White Wolf, San Francisco, Cal. No. 613,559. Dated Nov. 8, 1898. This invention relates to an apparatus which is especially designed for the massage treatment of persons. The object of the invention is to provide an apparatus by which a rubbing, pressing and general massage treatment may be applied to various parts of the body and limbs of the patient without the exhausting work which is necessary when such treatment is effected by hand. The apparatus consists of a supporting stand having arms pivoted to and adjustable with relation to it, and rack and pawl mechanism by which these arms may be adjusted so as to raise or depress the outer ends, the arms remaining essentially parallel in the manner of a parallel ruler. At the outer ends of these arms are fixed the rubbers, and a mechanism is provided comprising a crank and pitman connection by which the rubbers are actuated. In conjunction with this are springs by which the bars carrying the rubbers are drawn toward each other so as to maintain a constant rubbing pressure during the movements of the rubbers. The rubbers may be either roller or frictional and are adjustable upon the movable arms. Mechanism is also provided by which the pressure of the rubbers may be regulated.

WIPE ROD HOLDING ATTACHMENT FOR GUNS.—D. L. Howard, San Francisco, Cal. No. 613,560. Dated Nov. 8, 1898. The object of this invention is to provide a convenient, removable attachment for wiping rods so that they can be carried in conjunction with magazine and other rifles or shot guns. It consists of one or more elastic plates curved to enclose more than half the circumference of the magazine with outwardly curving convex wings having the upper ends approaching the sides of a barrel so as to form channels between the wings and the interior meeting angles of the barrel and magazine, these channels being sufficient to receive the wiping rod sections which are held in place by grooves or notches which hold the magazine in place. The same construction adapted to clasp the barrels or shot gun will also form sockets for wiping rods of this class of guns.

PRUNING SHEARS.—J. Simon, Santa Rosa, Cal. No. 613,570. Dated Nov. 8, 1898. The object of this invention is to construct a pruning shears in such a manner that a positive drawing out of the blade is produced while the strength of the pivot joint is increased,

and in conjunction with this to provide an automatic opening or separation device for the cutters which will not be hard and tiring upon the hands of the operator. It comprises the moving cutting blade and pivoting magazine jaw, with extensions formed on each which cross each other rearwardly, the wing projecting from one side of the magazine jaw, and a corresponding jaw projecting from the base of the cutting blade supported upon and connected with the first named jaw and pivoting pivot pin so that the wings form a fulcrum at the side of the blade. A separating spring is fitted adjacent with the pivot pin and connected in a socket formed for the purpose which prevents its being moved or interfered with while the cut is being effected.

MAHINERY & CASTING LEADS IN FIRE-NEW LINES.—Erik Magnus, Astoria, Oregon, No. 613,581. Dated Nov. 8, 1898. The object of this invention is to provide a machine which is designed to cast leads or solder upon distances of several feet apart as may be desirable and with accuracy, at the same time making said leads so that the ownership of the net can be readily determined. It consists of mold sections having semi-circular formed upon their outer faces, guides upon which the sections are slidable toward and from each other, with means for regulating the opening of the sections, a horizontally disposed transverse bar by which the sections are movable, with other bars extending horizontally upon each side of the sections having grooves formed in them, removable disks with projecting lugs within which the notches are in position to engage when the molds have been closed and a lever connecting with the disks whereby the molds are secured, clamped after being closed. The set line is passed backward and forward through the channels and molds and hook-shaped vertically movable appliances are adapted to engage the rights of the line to produce a tension while the casting of the lead upon it takes place.

ALMOND HULLER.—Walter G. Read, Colusa, Cal. No. 613,587. Dated Nov. 8, 1898. The object of this invention is to provide an apparatus for removing the hulls from almonds and separating them and dirt, leaves, sticks, etc., so as to deliver the almonds in a substantially clean condition. It comprises a rotary cylinder formed with open spaced parallel peripheral bars, interior arms fixed to a central shaft and rotating therewith, means for delivering the unhulled almonds to the cylinder, the almonds and hulls discharging from the opposite end and rubbing boards or flaps supported so as to press against the bars of the cylinder to loosen the hulls from the nuts, the loosened hulls being drawn through between the cylinder bars. Beneath the cylinder are pans which receive the nuts and constantly remove them. The unhulled almonds are delivered by a suitable feed device into one end of the cylinder and the greater part of the almonds and hulls are discharged at the opposite end. A blast appa-

atus forces a current of air across the falling mass of the almonds and directs away, before they reach the discharge, leaves, sticks, the shuckers, and a large portion of the husks and light refuse a blow down and is carried away upon a traveling water. The discharged almonds and hulls are received upon a pan and separating rider formed of wire mesh and having the curved bars through the wires of the rider, while the almonds discharge from the upper end and are carried to the bottom upon a traveling bar, where they are separated from the few remaining hulls.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOV. 8, 1898.

413,581—LAWSON MACHINERY—W. G. Read, Colusa, Cal.

413,582—STATIONARY ENGINE—J. H. Hart, Bridgeport, Cal.

413,583—WATER PUMP—J. C. Brown, Fresno, Cal.

413,584—MACHINE—J. E. Brown, Fresno, Cal.

413,585—TANK—J. C. Brown, Fresno, Cal.

413,586—WATER PUMP—W. G. Read, Colusa, Cal.

413,587—HEATING AND COOKING APPARATUS—A. H. Brown, Fresno, Cal.

413,588—SAFETY VALVE—J. S. Brown, Fresno, Cal.

413,589—MASSAGE MACHINE—W. G. Read, Colusa, Cal.

413,590—WATER PUMP—J. C. Brown, Fresno, Cal.

413,591—HEATING AND COOKING APPARATUS—A. H. Brown, Fresno, Cal.

413,592—BRIDGE—A. E. Brown, Fresno, Cal.

413,593—DENTAL CHAIR—J. W. Brown, Fresno, Cal.

413,594—CANNING LEADS IN FIRE-NEW LINES—E. Magnus, Astoria, Ore.

413,595—TIRE TIGHTENER—Macdonald & Everett, Spokane, Wash.

413,596—FIREARM—M. Magnus, Astoria, Ore.

413,597—PORTABLE SHED—H. E. Brown, Los Angeles, Cal.

413,598—BAR SHAKER—H. J. Brown, Fresno, Cal.

413,599—ALMOND HULLER—W. G. Read, Colusa, Cal.

413,600—SMELTING FURNACE—J. H. Brown, Fresno, Cal.

413,601—CRIBBAGE BOARD—R. S. Brown, Fresno, Cal.

413,602—ENGINE—J. P. Brown, Fresno, Cal.

413,603—ENGINE—J. P. Brown, Fresno, Cal.

413,604—PRUNING SHEARS—J. Simon, Santa Rosa, Cal.

413,605—DILLON FACTORY—J. Brown, Fresno, Cal.

413,606—RAILROAD SWITCH—J. H. Brown, Fresno, Cal.

413,607—ADVERTISING DEVICE—T. Brown, Fresno, Cal.

413,608—FIREARM—J. Brown, Fresno, Cal.

413,609—SHED—A. Brown, Fresno, Cal.

413,610—DILLON FACTORY—J. Brown, Fresno, Cal.

NOTE.—Plans and Copyright Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., special agents for the Pacific Coast, American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

A Los Angeles, Cal., Establishment.

Southern California is developing the mineral wealth of that section, and its business men are realizing the opportunities therein. Among prominent Los Angeles firms is to be noted the handsome establishment of William H. Hoegge, 136 South Main St., Los Angeles, Cal., wholesale and retail dealer in texts, drawings, maps, hammocks and mining supplies, occupying the great hall formerly the site of the Hall of Industry, with a frontage of 61 feet, where he is utilizing every day 50,700 square feet of selling space. A chief

feature of the business is miners' supplies, his stock and assortment embracing about everything that a miner may need. Mr. Hoegge's factory for the manufacture of canvas articles is thoroughly and modernly equipped for promptly making anything from a feed bag to the "largest" tent. Sporting goods and coating supplies each share a generous amount of floor space. By the way, the clause used in Mr. Hoegge's advertisements, has become proverbial in that region, through the popularity of his factory prices. Mr. Hoegge has studied the needs of the general prospector, and in the knowledge that he was able to furnish many men to better advantage than at some points nearer these gold fields.

Horizontal Tubular Boiler.

The essentials of a good steam boiler may be enumerated as follows: The heating surface must be ample, and must be so arranged as to promote a free and rapid circulation of water and absorb the greatest possible amount of heat; the steam room and the evaporative surface must be large, so as to allow of an easy release of the steam from the water, and afford a steady supply, of uniformly dry quality; all parts of the boiler should be as accessible as possible for examination, repairs and cleaning; the structure should expand as uniformly as possible, so that there shall be no severe strains produced when the temperature of the boiler varies from any cause; the boiler should be durable and should possess an excess of strength, when new, in order to provide for wear and other deteriorating influences; it should not be liable to expensive repairs, and its first cost should be as low as is consistent with the other requisites already mentioned.

The horizontal tubular boiler has been considered to conform very closely to these requirements, and for this reason it came into general use. The best methods have not always prevailed either in the design or in the erection of this type of boiler; but this is no fault of the type itself. Fewer tubes should be used than was formerly the custom; ample space should be left between the tubes and between the tubes and the shell; and the feed pipe should be so disposed that the entering water might not cause severe strains in the shell plates. The evaporation of two pounds of water per hour per square foot of heating surface (or a duty of one nominal horse power for each 15 square feet of heating surface) was realized as an average performance with this type of boiler, before the recent improvements in its design, and these data were used in computing the commercial rating of such boilers; but owing to the lack of uniformity in design there was a corresponding variation in the economical results that were obtained.

The advent of high pressures has called for a stronger mode of construction and thicker shell plates, and some engineers and boiler makers have feared that the thicker plates would reduce the efficiency of the heating surfaces by diminishing their power of absorbing heat in a marked degree. It has also been feared that the thick plates would deteriorate rapidly under the action of the high temperatures to which they are exposed. Many boilers constructed of half-inch plate have been in constant operation for the past ten years, however, showing good efficiency and so little deterioration that not one dollar has been expended for repairs. While the thickness of the plate must necessarily have some influence on the heat-transmitting power, it is so small that it may be neglected in practical work. Engineers experimenting with plates ranging in thickness from one-eighth to three-eighths inch have found that when all other conditions are the same the heat transmitted through a given plate in a given time is sensibly independent of the thickness. Experience indicates that these results are true for a considerable distance beyond the range indicated above. The resistance of a plate of metal to the passage of heat through it appears to lie principally at the two surfaces of the plate, where the heat enters and leaves it. Rankine calls this skin resistance the "external thermal resistance" of the plate, to distinguish it from the resistance opposed by the body of the plate, which he calls the "internal thermal resistance;" and he says in his *Steam Engine*, Part 3, Chapter I, Section 3, that "the external thermal resistance of the metal plates of boiler flues and tubes and other apparatus used for heating and cooling fluids is so much greater than the internal thermal resistance that the latter is inappreciable in comparison, and, consequently, the nature and thickness of these plates

have no appreciable effect on the rate of conduction through them."

Heat transmitted through a given heating surface may be considered to be independent of the nature and thickness of the plate through which it is to pass and to be simply proportional to the difference in temperature between the water that touches the plate on the one side and the hot furnace gases that touch it on the other. The temperatures of the gases and water in contact with the respective sides of the plate will vary with the circulation in the furnace and in the boiler; for, with poor circulation on both sides, the gases in immediate contact with the plate are cooler than the average temperature of the combustion chamber, and the water in contact with the plate is warmer than the general mass of water in the boiler, so that the temperature difference between the two surfaces of the plate is smaller than it would be if the circulation were good, and the heat transfer is correspondingly less. In well-proportioned boilers having free circulation and large evaporative surfaces, the steam bubbles that form on the heating surface are rapidly disengaged or thrown off and rise quickly to the surface. Where the circulation is poor, or the steam bubbles have a long distance to travel before they can escape from the water, the steaming qualities of the boiler are necessarily impaired. The horizontal tubular boiler, when properly constructed, fulfills these desirable conditions.

The setting of an externally fired boiler has an important influence on the efficiency of the boiler, and hence it is necessary to design and construct the setting intelligently. If the specific heat (at constant pressure) of the furnace gases be assumed to be sensibly constant, it follows that the maximum efficiency will be realized by securing the highest possible furnace temperature, simultaneously with the lowest admissible temperature of the gases that escape to the chimney. To secure this combination, the proportion of grate surface to heating surface must lie within certain limits, and the coal consumed per square foot of grate per hour must also be carefully considered. In certain experiments with a small horizontal tubular boiler, in which the ratio of the grate surface to the heating surface was as 1 to 25, the highest economy was obtained when eight pounds of coal were burned per hour on each square foot of grate. With a more rapid rate of combustion, the capacity of the boiler was increased, but the economy was diminished. This result appears to be well substantiated by many boiler trials that have come under our observation. When the grate area stands to the heating surface in the ratio of 1 to 50, the rate of combustion can be increased to fifteen or sixteen pounds of coal per square foot of grate per hour, and the heating surfaces, if well arranged, will absorb and utilize the heat. By an increase in the ratio of heating surface to grate area, it is therefore possible to burn more coal efficiently on each square foot of grate area. This means that a greater intensity of combustion—or, in other words, a higher temperature—may be realized in the furnace, without a corresponding increase in the chimney temperature; and in accordance with the principle laid down at the beginning of this paragraph, this means that the efficiency of the boiler would be increased.

Storing Dynamite.

The question is often asked, "How long can dynamite be kept if properly stored?" Prof. Prister of Johannesburg said that temperature had the greatest influence on the stability of nitro-glycerine. The first condition was that the nitro-glycerine used in the manufacture of dynamite should be absolutely pure and free from any acid, and from mono and from dinitro-glycerine. Pure nitro-glycerine supported only for a few hours a temperature of 212° Fahr. Kept at 158° Fahr., it gave off acid vapors after ten to

fifty minutes. At 113° Fahr. to 122° Fahr., its stability was greatly impaired in a few weeks. At 112° Fahr. it could be kept unaltered for months. Traces of nitric acid or nitrous acid favored its decomposition.

The absorbing powders employed in the manufacture of dynamite were of great importance. Two years ago a decomposed dynamite exploded and destroyed a store merely in consequence of the bad composition of the absorbents which were sulphur, nitrate of soda, collodion-cotton and coal. It was well known that sulphur should be excluded from these mixtures as it might become acid, especially if sublimate sulphur were used.

In the above mentioned case probably the small quantity of pyrites in the coal initiated the decomposition of the whole.

Chlorides and chlorates, as well as the organic acids formed in drying woodmeal, reduce the stability of dynamite. Prof. Prister recommended that a certificate be obtained from the manufacturer guaranteeing the good quality of the explosive, as it was impossible for each mine to afford to pay an explosives expert to examine it. Uncartridge dynamite No. 1, exposed to wet air, might absorb $\frac{1}{2}$ per cent of moisture per day. The average amount of moisture in good dynamite was $\frac{1}{2}$ per cent. If, on entering a dynamite store, the smell of nitric acid was noticed, the explosive should be destroyed without delay.—Mining Bulletin.

Discrepancies in Slime Treatment.

At the last reported meeting of the Chemical and Metallurgical Society of South Africa, as set forth in the Journal of the Society for September, in a discussion of the paper on "Discrepancies in Slime Treatment" by W. A. Caldecott, A. F. Crosse said that the only correct way to estimate the total gold in a sample containing dry moist slimes containing dissolved gold would be to dilute a weighed portion of the sample having estimated the moisture. To two litres with water take one litre off by decantation. Estimate the gold by precipitation with silver nitrate and fusing with lead oxide and cupellation. Double the result. Then pour the bottle into a large cone having an opening at the bottom and one or two openings at the side.

If the slimes be now diluted with several litres of weak lime water they will soon settle, and the clear solution containing the dissolved gold can be drawn off. If this operation be repeated twice, there will be practically no dissolved gold left.

The washed slimes can now be dried in a prospecting pan, without any danger as regards loss of gold; but when slimes are dried in contact with a solution of gold, the result of the assay is not to be relied on and a check assay from such a sample will be equally valueless.

The object of the following experiments was to find out the loss of gold, if any, on scorifying and cupelling large buttons of lead with very small quantities of pure gold, such as would be obtained in a fusion assay with slimes or tailings. The gold was in the form of very fine wire. Pure grain lead was taken and wrapped in lead foil, a small piece of pure silver wire was added to each lot, equal to five or six times the weight of the gold.

The first five lots were scorified down to a moderate size (about 34 grammes), then cupelled.

| Weight of lead. | Weight of gold. |
|-----------------|--------------------|
| 1. 90 grammes. | 1.25 milligrammes. |
| 2. 90 " | .50 " |
| 3. 90 " | .30 " |
| 4. 70 " | 1.25 " |
| 5. 50 " | 1.25 " |

The next lot were cupelled, the heavier ones in extra large cupels.

| | |
|----------|---------|
| 6. 50 " | 1.25 " |
| 7. 50 " | 1.25 " |
| 8. 33 " | 1.00 " |
| 9. 33 " | 2.00 " |
| 10. 33 " | 5.00 " |
| 11. 33 " | 10.00 " |

In each case, after parting the little button of gold and silver, the exact weight of gold was obtained, which had

been originally added. Accurate assays can be made of slimes containing a solution of dissolved gold, and if large buttons are obtained in a fire assay, it does not effect the result nor cause any loss of gold.

W. Bettel: I should like to ask Mr. Crosse to explain why in the last sentence he said that the soluble gold in the sample of slimes could be readily estimated and in an earlier part of his remarks says that if solution of gold be present in the sample of slimes it should be washed out and separately assayed to get at the correct original gold contents.

A. F. Crosse: I meant to say that the fact of the gold being in solution did not affect the assay in any way; it only affected the sampling. There was a mechanical loss, but if one has five assay tons of matter containing gold in solution dried on a filter the assay of this small quantity is a different thing from drying moist slimes in a prospecting pan.

W. Bettel: So far as my experience goes there ought to be no loss in evaporation. If the slimes were put over a furnace and boiled recklessly there would be loss; but if placed on a water bath in a porcelain dish there would be no loss of gold. If assays were properly done, from 95 to 97 per cent of the actual amount of gold in the material should be obtained.

The President: I understand that Mr. Crosse explained for the loss in evaporation on account of the gold which was contained in the solution sticking to the vessel and it being difficult to remove it. If the operation is performed in a pan there will be a loss on account of the rough surface.

W. Bettel: I evaporated in large porcelain dishes. With regard to Mr. Caldecott's paper, I am sorry it has been put forward, because if the results he gave were the average results on the Rand it would be a disgrace to the society. But I hope that not many assayers on the Rand will turn out such bad results. I have never found assays so very incorrect. But if assayers melt at a high rate of speed all the gold would not be brought down and the assayer doing it cannot swear by his results.

I do not see why accurate results should not be obtained in every case except where the general manager overburdens the assayer with work so that he has no option but to work at high pressure without giving thought to refinements in assaying which ensure accuracy.

Meteorite Found in Oregon.

TO THE EDITOR:—In September Jas. Arthur was excavating a ditch on his placer mines near Cornucopia, Or., and came in contact with what seemed at the time a cigar-shaped bunch of brown clay; to get grade, half of it was removed, which took off 18 inches from the top of the bunch, which was 4 feet long. The grade was changed last week in the bottom of the ditch by the heavy current of water, but the "clay" remained as left when the ditch was completed. Mr. Arthur, seeing the obstructions, took his pick to remove the clay, and found a hard substance imbedded in the clay, which was removed with ease and nothing thought of it. The frost acted on the clay and also on the ditch bank, and the whole of the clay and hard substance was caved into the ditch and received a thorough washing. Then it was discovered that it was a meteorite, 9 inches wide, 22 inches long and 4 inches thick, with sharp edges on two sides and one end. The other end looks as if broken. The surface on both sides is covered with something like pointed warts.

MINER.

Cornucopia, Or., Nov. 10th, '98.

The largest freight train ever hauled went eastward from Altoona, Pa., to Columbia, on the 8th, over the Pennsylvania Railroad, 130 cars coal, a train 3877 feet in length. The total weight of the train behind the tender of the engine was 5212 tons.

Mining Summary.

ALASKA.

Juneau Miner: The Comet mine, one of the Berners Bay Co.'s group, continues profitable. The tunnel driven last season intersects the vein at a depth of 1000 feet. Up-raises are being made. Seventy feet above the 1000-foot level in the upraise a valuable body of ore was encountered, which will average 6 feet in width. The mine alone supplies twenty stamps. In the Kensington mine, a quarry, a tunnel has been run to facilitate winter work. The ore body is 80 feet wide. This mine supplies twenty stamps. The new 20-stamp mill being built by Mellen M. & M. Co. on its Berners Bay property will soon be ready for the machinery. A gravity railway 4000 feet long has been constructed and two wire trams connect this railroad with the upper workings of the mine. A force is employed driving tunnels and sinking the shaft, and the machinery has already been landed on the dock at Seward preparatory to being taken to the mine.

ARIZONA.

The Sheeptrail mill near Kingman is turning out a good amount of bullion monthly. The Old Dominion Copper M. & S. Co. at Globe employs over 300 men. The Black Warrior Copper Co. has resumed hauling ore to the Globe smelter. The daily shipments amount to sixteen tons.

At the Barrett copper camp there are 1000 tons of ore ready to smelt and the smelter will be blown in. On Gum creek, in Gila county, Gowan & Prantz are developing a gold and copper claim. A. Solano bought the old Diana mine at Chloride for \$8000. W. J. Murphy is developing a property near Chapparral which is producing good ore. The development of the mine will be continued during the winter. Col. Brodie will place a 10-stamp mill, a steam hoist and other equipment on the Crown Point mine in Castle Creek district, Yavapai county. At the 300 level the ore chute had 2 feet of quartz which contained good values.

Yuma Sun: A cyanide plant of 160 tons daily capacity is being put in by La Fortuna M. Co. for extracting the gold from the tailings accumulated in two years at the 20-stamp mill at that place. These tailings, according to conservative estimates, will go from \$3 to \$5 per ton. The ore is said to have paid for two years 10 per cent per month on the money invested by the stockholders of La Fortuna Co.—The Daisy Dolores near Tyson's Wells, owned by E. Steward and associates is being successfully developed. A large body of ore has been opened and the lowest assays received are \$10. Much of it will be shipping ore.

Tucson Citizen: Jacobs & Childs sold to W. Shotwell of Denver, Colo., the Cardinoff mine in the Ojo district, Pima county, for \$100,000. A 40-ton plant is to be erected and will be enlarged till it reaches a capacity 300 tons daily. The ores are copper and gold. The owners receive \$100 each every month and 30 per cent of the gross proceeds.

Mohave Miner: At the Klondike mine near Mohave the mill is crushing ten tons every twenty-four hours. The cleanups are satisfactory.

Globe Times: A. Heller has in operation a water power arrastra on Spring creek near Payson. The ore is hauled two miles. The returns of this arrastra are good.

Tucson Star: The mill connected with the mining department of the University is being put up for a test on a couple of carloads of wolframite ore from the Dragoon mountains. T. L. Ayres has several men at work on the Golden Gem mine at Cerbat.

CALIFORNIA.

Amador.

Jackson Ledger: Scarcity of water causes the Kennedy mine at Jackson to use steam at both hoists.—Sinking at the Zeila continues. Two and one-half feet is made daily. Sinking has reached 1310 feet and 100 feet more will be sunk before drifting begins at the new depth. Fifteen stamps are operated, daily crushing from sixty to seventy tons of ore.

Jackson Republican: The Keystone mine and mill at Amador City have been running with a full force, but owing to a scarcity of water the mill will be idle about a week. The ore runs \$6 per ton.—The lease on the Median mine to J. A. Bennetts has been extended to May 1, 1899. The South Spring Hill mill is being used to crush the rock.—A San Francisco mining man is building a small mill on the Empire mining property in Plymouth.

Jackson Dispatch: The Cooper gold mine at Oleta has a 20-stamp mill to crush the gravel, and work proceeds with favorable prospects.—The Kennedy Co. at Jackson has decided to sink a new shaft as soon as the necessary machinery can be placed. The shaft will be a half mile east of the present works, and intersect the vein at a depth of 3500 feet. It will be a vertical shaft, with three compartments, 4½ feet each in the clear. At first it is intended to put hoisting machinery in place that will permit of sinking the shaft to a depth of 1500 feet, and then to put in engines that will hoist ore at a high speed.

Butte.

Oroville Register: The Sunnyside mill, near Oroville, owned by McClung & Co., started up last week. There is enough ore to keep the mill running steadily.

Calaveras.

San Andreas Prospect: A 4-foot vein of good ore has been found in the Paragon mine at West Point.—The Bonanza, New Discovery, Wonder and Washington quartz mines near San Andreas have been bonded to M. C. Hawes of San Francisco for sixty days. Work has begun on the Bonanza and Washington. The Bullion has an 8-foot ledge. The Wash-

ington has a 4-foot ledge and in the Bonanza there is a 4-foot ledge.

San Andreas Citizen: L. Emery Jr., of Bradford, Penn., has seventy-five men digging a water ditch 5 feet wide and 2 feet deep from the Little Mokelumne river to El Dorado, whence another ditch will be dug to the Rose Hill mines near El Dorado. Mr. Emery will expend \$50,000 before any returns can come from the outlay. Along the route of the ditch are mines now idle which will begin operations when water is secured which is promised this month.

Angels Echo: The Utica Co.'s mines and mills will not start up till the rains set in.

Jackson Dispatch: At the Gwin mine, Mokelumne Hill, work is progressing. Shifts are drifting south on the 1000, 1200 and 1400 levels, working from the north shaft, and taking out a good quality of ore in sufficient quantity to keep the 40-stamp mill running day and night. The pump and air compressor have been transferred from the south to the north shaft, and all the work is being done through the latter. The mill is run by water power and the hoist by steam. Circular saws and machinery for framing timbers are being put in the timber yard, and other important improvements are in contemplation.

El Dorado.

Work has resumed at the Miller mine near Diamond Springs.

Placerville Nugget: W. C. Greene & Co. have bonded the Atlantic mine in Placerville and are developing the property.—On the Gold Bug, D. H. Jackson is sinking a new shaft.—F. Staples at Logtown is opening the old Capital claim and will soon start milling. He has opened on paying ore in a 2-foot ledge. The Capital has lain idle for many years.

Georgetown Gazette: In the El Dorado Gravel M. Co.'s property, near Josephine, development work is in progress. A channel has been struck by boring and a tunnel will be driven.—Hayward & Lane have bonded the Phillips claim near Mt. Gregory, and preliminary work has begun.

Kern.

G. M. Rose and partners, working a group of claims seventy-five miles east of Johannesburg, will build a stamp mill the first of the year.—Shipments of lumber and machinery are being made to the California Borax Co.'s new plant near the old Seales works. They expect to turn out borax Jan. 1st.—The Bordon Borax works have also a large property of borax and mineral lands, on which they are doing development.—The Red Dog mill is running on ores from the Butte and Wedge mines.

Los Angeles Review: It is estimated that the clean-up of the Yellow Aster mines at Randsburg for October will be \$50,000.

The Red Dog mill is running on ore from the Butte and the Little Butte mines.—A. W. Collins has bought the O. K. group of claims and will immediately begin development work.—The new pump at the wells of the Yellow Aster M. Co. has been set to work, and the lumber is on the ground for the tank, which will contain 100,000 gallons.

Randsburg Miner: In excavating for the walls for the Yellow Aster 30-stamp mill at Randsburg they encountered the 15-foot Olympus ledge in decomposed quartz gravel.

The Rand tunnel, in crosscutting to the Tribby ledge, encountered the Vertical ledge and two other ledges which ran high in value. The whole Tribby mountain in this crosscut is intersected with ore seams. Wherever this company has excavated for hoists, magazines or mills they have encountered pay ore. Supt. Singleton will sink a shaft at the mill, with 30 H. P. hoist and double-decked cages. This will explore the whole underground workings of the Olympus and Tribby mountains at 2500 feet deep, besides saving all surface tramways and handling. All ore will come direct from this incline, which will have two compartments and a manway. The electric plant of the mill will furnish 500 incandescent lights.—The Eureka mill has been running recently on a number of small lots of ore, in nearly all cases rich. They are now at work on Wedge ore.

Mariposa.

(Special Correspondence).—Capt. A. H. Ward has arranged to work his Spencer and Grub mines, adjoining the Tendon, at Whitlocks, and arrived here last week to begin operations. Good ore bodies are in sight in both claims.

The Egenhoff Bros. are taking out high grade ore from their claim on Quartz mountain, near the Merced river.

The mines and mill of the Merced Co. at Coulterville closed on the 5th, the water in the reservoir being exhausted. It will not be possible to resume till the fall rains set in. The Mary Harrison mine is in excellent shape at present, the main ore shoot being opened up from the 400 to the 700 level. This shoot is about 300 feet in length and 6 to 12 feet wide, and is said to mill "better than \$10 per ton." Since the cost of extracting and milling this ore is somewhere between \$3 and \$4 (exclusive of the cost of development work of the past year, which was between \$1 and \$2 per ton of ore blocked out), the stockholders may at last look forward to some return on their investment. A crosscut is being run through the big ankerite vein on the 700 level in the hope of encountering another ore body on the hanging wall.

The Golden Crown Co. has between thirty and forty men working at the Big Betsey. Large hoisting works have been erected and a mill is soon to be placed on the property. The ore is base, carrying a high percentage of iron pyrites.

J. H. Galey of Pittsburg is working the Murphy mine, half a mile south of the Mary Harrison, at Coulterville. New machinery is being put up. Some rich ore has been taken out and the present workings show 5 feet of high grade milling rock on the 100 level. Mr. Galey has also secured an option on the Por-

ter mine, near by, from which the manager and the clean-up recently disappeared.

The California Exploration Co. is making preparations in a small way to resume work on the Virginia about Jan. 1.

The Merced Co. and an outfit said to be in the interest of the Shawmut Co. of Jacksonville are digging ditches on the South Tuolumne. Five years ago the former bought the old Oak Flat ditch, which had then been abandoned a score of years. They did nothing with it, however, till recently, when the water was relocated, presumably for the Shawmut people. The water right is considered valuable, as during a large portion of the year there is considerable water, and the stream has a great fall. Both sides announce the purpose of building electric plants. The matter will probably reach the courts.

Mariposa, Nov. 15th, '98.

Mono.

Bodie Index: The Bodie tunnel mill is running on ore extracted by leasers; there is a good quantity ready for crushing.—E. Juhl, at the Little Stranger mine, took out eight tons of ore, of which he is making a test crushing.

Bridgeport Union: At the Arnot and Par-value mines, near Green Creek, a 4-foot ledge has been struck which is said to yield \$60 a ton. Twelve tons of ore have been daily taken out and hauled to the Dunderburg mill. The mines have closed down for the winter.

Nevada.

The old Home M. Co. at Blue Tent have again struck the ledge. It is about 4½ feet in width.

Grass Valley Union: W. L. Wallace contemplates the erection of a small mill on his mining properties near Graniteville.

Nevada City Transcript: There is only 6 feet of water in Fordyce reservoir, the usual amount at this season of the year being 40 feet. Unless rain falls this week the South Yuba Co. will completely shut off water supply to the mines, which will necessitate stopping the pumps, which up to the present have had power supply.

Transcript: In Washington and Maybert districts the Grey Eagle, the Lindsey and the Ocean Star are all making a good showing.

Placer.

Colfax Sentinel: The mill at the Herman mine near Deadwood is running day and night. Thirty-five men are employed. The ledge is from 10 to 12 feet wide, all milling ore.—The Golden West quartz mine near Blue canyon has 700 feet of tunnel on the ledge. A new tunnel will soon be started 200 feet lower on the river, 32 feet above high-water mark.—The tunnel of the Blue Canyon M. & D. Co. is in 1150 feet. The company uses a machine drill and employs five men.—J. W. Schmutzler, with seven men, is working the Dardanelles and Big Spring gravel mines near Forest Hill.

Plumas.

At the DeLong mine, near Long Bar, forty men are employed. The preliminary work for working the bar and river banks has been completed. Heavy machinery has been brought in.

Quincy Bulletin: At the Nugget mine, near Granite basin, J. Peppin is hauling 150 tons of ore from his mine to the Robinson mill for crushing.—See & Jolly are opening a good ledge in their mine. The ore body is large.

San Luis Obispo.

The San Francisco company operating the Santa Clara quicksilver mine at San Simeon has four retorts of five tons capacity running and twenty men employed.

Shasta.

Connors & Son are getting out high-grade ore from their Salt Creek property in Lower Springs, and at the first rain will start their quartz mill.—The mill at the Spanish is silent for lack of water, but the force is getting out ore.—Capt. Roberts of Harrison gulch has secured a controlling interest in the White Oak at Lower Springs, and it is locally reported that he will sink a shaft soon.—Near Shasta the Shurtleff Hill mine is doing development work.—The Mt. Shasta has thirty men taking out ore.—Pugh & Menzell are hauling ore to their mill on Clear creek. The country is filled with prospectors.

Redding Free Press: Salee & McDonnell have resumed shipping ore from the Bully Hill mine at Copper City to the smelters at tide water.—E. P. Conner, near Shasta, has men developing a new property.—The mill at the National mine, near Buckeye, has resumed operations. The power for the mill is furnished by the Paul and Garlick electric plant near Copley. The water supply has increased. There are 300 tons of ore ready to be worked.—The Gopher mill, near French Gulch, owing to a lack of water, has closed until the rains come.—A. Halen has sold to T. Anderson the Santa Claus quartz mine in the Buckeye district.—Mullen & Blackwell sold to L. H. Snell for \$500 a one-third interest in the Golden Eagle quartz mine, Harrison Gulch district.—G. Reinhaus bought from T. J. Montgomery the Fisher and Pick Up quartz mines, French Gulch district.—L. Thompson, for \$300, sold to T. F. Morrissey the Gray Eagle quartz mine, Harrison Gulch district.

Redding Searchlight: The Eureka mine at Middle Creek, which has been idle over two years, will resume, litigation having been settled. The property has about 3000 feet of surface cuts, from which high grade tellurium has been taken. Under the present ownership, development work will determine values at depth.—Near Delta, the Advance M. & M. Co., a corporation of San Francisco and Oakland capital, has erected a 15-ton cyanide plant on the Tought mine. Tests prove the practicability of the cyanide process on these ores.—On the Bard & Hunter mine, at McCall's, the owners are putting in a Hunting-

ton mill. The owners of this property recently bought the Delta mine.

Sierra.

Grass Valley Union: Near Alleghany everything in the mining line is looking well. New claims are being opened and improvements going on in every direction.—The Plumbago mine is said to be yielding \$25,000 per week. The ore is more gold than quartz. Two years ago this mine was idle for the want of capital to develop it.

Siskiyou.

M. Souther, managing agent of the Eastern company prospecting Yankee creek basin, near Yreka, the past summer, is expected to close for the land next week and work the same on an extensive scale. The ground has been prospected by steam augers, but the success obtained is only known to the men superintending the work.—Fry & Macauley's mill on Cherry creek will soon begin crushing quartz from the Ironside ledge, recently bought by them. They will also crush prospecting quartz from the Hunter & Co. ledge, until the latter puts up a mill.—B. G. Reeder is getting good quartz from his ledge in Fool's Paradise district, Shasta river.

The miners feel hopeful of having a good winter season for rain and snow, and are prepared for extensive operations. A good deal of prospecting has been done during the past summer.

Yreka Journal: A Boston company is finding good prospects at the old Eagle mine on Indian creek. The Grizzly, or old Bonanza, ledge, in same vicinity, is to be worked again next spring.

Yreka Reporter: The King Solomon mine on Canyon mountain has again started up.—The Wilson Bros. have resumed work on their claim on Eddys gulch, in the Salmon country.

Yreka Journal: The new owners of the Commodore quartz mine at Barkhouse are working twenty men and taking out good quartz. The 6-stamp mill has been running for several weeks.—The quartz miners in Quartz valley are making preparations for carrying on work during the winter.—At Oro Fino the Eastlick and Wright hydraulic mines are being fixed up for extensive operations.—The cold mornings make trouble in working at the river claims on the Klamath, as the melting of frosty ground during the middle of the day causes caves of banks.—W. A. Chamberlain has been prospecting in the McCloud mountains, at the Siskiyou and Shasta county boundary line, and found some good quartz, which he intends developing.

Tuolumne.

The Santa Ysabel mine, near Quartz, struck the central ore chute at the fourth level. It is estimated that the ore can be treated at a profit of \$10 per ton. The mill will be started when water supply can be had.—The Trio property, in which owners of the Santa Ysabel are interested, is said to be showing well, and the erection of a mill is contemplated.

Sonora Democrat: Forty men are employed at the Densmore mine near Sonora. Mechanics are putting up a mill of four 1000-pound stamps, triple discharge. This is supposed to give a crushing plant equal to an ordinary 10-stamp mill. Enough ore has been taken out to run for a long while. Water will be piped from the Tuolumne Co. Water Co.'s ditch.—On the old Excelsior mine sinking the new shaft continues.—In the Cave Diggings district of the East belt several claims are being opened up.

Jamestown Magnet: The Dutch mill, at Quartz, began dropping fifteen stamps last week. The management hope to keep the mill running to at least half of its capacity.—The Stanley mine and adjoining properties near Jacksonville are being retimbered.—At the Mazepa mine, near Stent, a 4 H. P. engine, to operate the blower, is being set up. Sinking the shaft continues.—At the Rappahannock mine eighteen men are employed.—At the Bonita mine a shaft will be sunk 300 feet. Hoisting works will be erected.—At the Philadelphia diggings, near Columbia, ninety men are at work on the ditch and flume from the Stanislaus river.—The Jamestown Light & Power Co. have completed their plant and are ready to begin operations as soon as water is available. The completion of the reservoir at Hale's mill, on Herrin creek, makes the water supply reliable. The contemplated reservoir at Strawberry is to be built of masonry 100 feet high and will assure a supply to generate 300 H. P. at their power plant with two dry seasons in succession. The starting of this plant insures a permanent supply of water to the Mother Lode regions, as the water, after passing the power house, is retained in Phoenix lake, where it can be distributed as required. Motors have already been installed at the App and Rawhide mines, where the lines have been run, and extensions will be commenced on the pole line from Rawhide towards Angels, Coulterville and the Black Oak district.

COLORADO.

BOULDER COUNTY.

A drift was started from the 600 level in the B. & M. mine at Boulder on a body of ore 44 inches wide of a smelting quality. Supt. Bosson has forty-one men employed.

The Mogul tunnel at Eldora has cut several veins, and two of them, the Somerset and the Little Stranger are producing ore. The Little Stranger has recently been bonded for \$25,000.—The mining activity in Boulder county continues. A larger number of new mills are in operation all over the county and a larger amount of ore is being shipped out than ever before. Conservative estimates place the yield of this county for this year at \$2,000,000.—The old Pennsylvania mine at Sunnyside will resume operations immediately, the final payment of \$20,000 having been made by the Eastern purchasers.

CHAFFEE COUNTY.

The ninety-day bond and lease on the Independence mine at Whitehorn has been taken

up and \$25,000 cash paid for it. The deal was made by O. W. Crawford, who is one of the owners of the Golden Eagle. W. H. Welch of Chicago is at the head of the new company. He is also at the head of the M. J. King G. M. Co. that is operating extensively at Turret. The Waverley mine at Turret City, owned by the King G. M. Co. of Chicago, is said to have ore that yields \$125 to \$175 a ton in gold. —O. W. Crawford has bought the Independence mine, Whitehorn district, and made the first payment of \$5000. The mine will be worked in connection with the Golden Eagle, Cameron and Eastern View. Twelve men are employed and the first shipment has been made. The vein has been opened 1257 feet and ranges in width from 8 to 54 inches, the ore carrying values of from \$20 upwards.

CLEAR CREEK COUNTY.

The Pelican-Dives and Seven-Thirty group at Georgetown, which turns out a very large percentage of silver ore in the district, made heavy shipments last week, almost every lessee on the mine making a shipment. The mine employs 125 men and has over eighteen miles of underground workings.

At Idaho Springs lessees on the Champion have opened into copper ore in the fourth and fifth levels and made a shipment that netted \$45 per ton. The Dove's Nest has begun shipping ore, the first in six or seven years. They have cleaned out the levels and find a big body of mill dirt from the surface down.

EAGLE COUNTY.

From Red Cliff were shipped last week eight carloads of ore, making a tonnage since Jan. 1st of 10,580.

The Eagle River M. & M. Co. of Red Cliff is driving a tunnel to develop 1000 acres of mineral territory. The tunnel is in 300 feet and is to be driven two and one-half miles farther, which will take five years.

EL PASO COUNTY.

The output from the Legal Tender at Victor last month averaged ninety tons per day. The greater portion of it was low-grade mill ore. The Vindicator is one of the big shippers of Cripple Creek district. Last month from the company's workings 1500 tons were sent out and by lessees 1100 tons, making the total for October 2600 tons. When the new ore bins are completed and the spur of the Golden Circle Railroad is in operation to the mine the Vindicator will ship at the rate of 150 tons per day. The Keith & Grube lease on the Vindicator produced 800 tons in October, with an average of \$40 to the ton. Two new shafts have been started on the lease.

The Victor Record announces that Eastern capital within five months will have in operation in Victor a plant with a capacity of 500 tons a day, to handle low grade ore exclusively. The plant will be erected by the Oneida Co. at a cost of \$200,000. The Murphy electrical process will be used, which, it is claimed from experiment, will save 37 per cent of the values.

Victor Record: Lessees Miller & Co., on the Black Belle, Victor, received returns from a shipment of 9½ tons of ore at the rate of 7.77 ounces to the ton, and, after deducting treatment and transportation charges, netted over \$1000, after paying a royalty of 20 per cent to the owners of the mine and 5 per cent to the original lessee. There are eight sets of lessees developing the Black Belle and every one in ore. The lease has but a few weeks longer to run. Keith & Grube, the heaviest shippers of the Vindicator lessees, started for a new level. The shaft is down 125 feet. Ore production will be curtailed during development.

GILPIN COUNTY.

C. H. Werdnhoft has leased to S. Johnson the Lillian group, near Central City, for \$12,000.

Central City Observer: Two hundred and fifty pounds of ore from the Topeka mine, Russell district, gave 305.28 ounces gold and 27.94 ounces silver per ton. For the bar of bullion was received at the mint \$5146.96.

GUNNISON COUNTY.

The Black Queen mine of Crystal is being developed with thirty men. The mine was formerly a heavy producer of silver.

HINSDALE COUNTY.

The Lake City M. & L. Co. are erecting an electric hoisting plant on their Wisconsin mine. Sinking will be continued to 400 feet. The Varden Belle mine of Lake City has been leased to W. A. Bial for \$3000. It has an 8-inch pay streak which runs high in silver.

LAKE COUNTY.

The Maid of Erin Silver Mines Co.'s output at Leadville for October was over 3000 tons. About sixty men are working as leasers and employees. Seven shafts are in operation. The output is principally oxide iron. A lead carbonate, carrying iron, is also being shipped.

The Fanny Rawlings output in October 1000 tons of gold-copper oxide and sulphide ore. The Leadville Pumping Association is throwing 2100 gallons of water per minute with the four large special Snow sinking pumps hanging in the Penrose and Bon Air shafts. Three additional sinkers will be put to work. The water has been lowered 90 feet. The work is progressing satisfactorily. When the two station pumps are recovered at the Bon Air and Penrose the levels will be rapidly cleared. The recent manganese discovery made on the Modoc mine promises to be a steel iron mine. Twenty-five tons daily are shipped in developing this deposit. The ore is sent to Chicago. One of the next large undertakings to be got under way is the sinking of the three-compartment shaft on the Wolfstone, which is at present 600 feet deep. This will necessitate the unwatering of the miles of workings in the Maid of Erin, Adams and Wolfstone mines. This is said to be one of the requirements of the new lease that will be given by Pres. Hendrie of the Wolfstone Co.

The Resurrection M. Co. of Leadville is making extensive improvement about the mine. New ore houses with a capacity of 500

tons have been erected, and the shaft is being retimbered. More than 100 M. feet of lumber was used. The new mill will be begun next spring.

Leadville Miner: At the Union smelter at Leadville are roasted sixty tons daily of lead and iron sulphides from the R. A. M., Mahala and A. Y. and Minnie. They contemplate having the Denver & Rio Grande build tracks to the works in the spring. They also intend to rebuild the present furnaces, four in number, and add six new ones.

PITKIN COUNTY.

The mines at Aspen have not been worked so steadily since the fall of silver in 1893 as at present. They are largely worked on the leasing system, but some of the big companies are operating with fair success. There are very few, if any, good miners in the camp that are not at work.

SAN JUAN COUNTY.

The Excelsior of Silverton district has opened a 3-foot vein of galena. A streak of sand carbonates alongside the galena yields thirty-six ounces silver and 60 per cent lead.

The Ridgeway mine, Silverton district, shipped two cars of ore last week which netted \$1300 per car.

SAN MIGUEL COUNTY.

The U. S. & B. C. mill at Telluride is completed and will be in operation soon. About 100 tons of ore is ready for the mill.

SUMMIT COUNTY.

In October forty cars of ore were shipped from Breckenridge district, besides that treated at the different mills.

IDAHO.

A strike is reported from the Lone Star mine near Salmon City. This property is owned by the Bell M. Co. of Denver. The vein is extensively opened and yields \$8 to \$10 ore, most of which is base, carrying lead and copper concentrates and irregular bunches of rich ore.

Near Wallace the Hecla mine, in the last 400 feet of the 1400-foot drift, has been in continuous ore, and the face is in 7 feet of shipping ore, which assays 65 per cent lead and fifty ounces silver. J. A. Finch, A. R. Campbell and P. Clark of Spokane are the chief owners. The workings are at a vertical depth of 700 feet. The company has been shipping ore for some time, and it is locally reported here is planning to build a mill.

Pres. I. E. Blake of the Northwest Railway Co. and associates were at Seven Devils, where they bought the Peacock mine and let a contract to sink a 100-foot shaft and to run 200 feet of tunnel on the property. The Blue Jacket mine, near Seven Devils, has thirty men employed and is showing good copper ore. A new strike is reported near the Peacock, made by Rogers & Gardner. It is said the lead is from 4 to 12 feet wide and can be traced for half a mile.

The new dredge on the McNutt placers, at Moose creek, was started Oct. 29th to test the machinery, which was found to work in perfect order. The scow and metallic sluices are being attached, and the boat will be ready as soon as the ground thaws in the spring. This is said to be the largest placer dredge machine built. It has a capacity of 5000 cubic yards a day; it has been constructed under the supervision of H. J. Reiling. There are several patent appliances for catching the drippings, and it is estimated that the machine will save 96 to 98 per cent of all the gold contained in the gravel. The pay streak is from 100 to 300 feet wide, and runs from 60 cents to \$1 per cubic yard.

Hailey Times: Three carloads of ore were shipped from Hailey last week. There are 500 sacks of ore from the Narrow Gauge mines in Hailey for shipment. W. H. Wickham, Mgr. Cyanide works on the Hailey gold belt, has shut down for the winter. Work is progressing at the Tiptop mill and the pipe line is completed.

Idaho City World: In the Klondike quartz claim, near Idaho City, the ore continues to improve, the ore chute is 120 feet in length and the ore mills at the rate of over \$100 a ton.

Florence Miner: The Jumbo claim, in Robbins mining district, has a ledge from 12 to 24 feet wide and runs from \$15 a ton upwards.

Salmon Recorder: The carload of ore recently shipped to Butte from the Copper Queen mine at Salmon yielded \$16 in gold per ton, five and one-half ounces in silver and 2.78 per cent copper.

MONTANA.

Blewett & Cobb shipped eighty sacks of ore from Copperopolis that runs 30 per cent copper. They will soon ship 600 sacks of the same grade.

The East Helena smelter plant is being operated by the electrical plant at Canyon Ferry, on the Missouri river. All the machinery formerly run by steam power is now driven by electricity. The blast furnaces were shut down but four hours while the steam power was being cut out and the electricity installed. There are a number of motors, two of 175 H. P. each, three of 100, one of 50, one of 30 and one of 20.

The new Diamond shaft of the Anaconda Co. was begun two years ago to develop to the 2000-foot level. Work has been in progress since the shaft has reached 1700 feet, and will be continued until the 2000 level is reached. It is said to be the quickest work in sinking mine shafts in the history of mining. The shaft cuts the mammoth copper ledge at a depth of 1650 feet, where the ore showed an average value of 50 per cent copper and high in gold. A monster engine, similar to the one at the Anaconda, is being constructed in San Francisco for this shaft. At the Copper Jack mine, Butte, drifting has begun at the 100 level, where there is 18 inches of ore. At the 200 a crosscut is being driven.

Garnet News: The steam shovel on the Summit placer mine, near Garnet, is working successfully, handling and washing from 500

to 800 cubic yards of dirt in ten hours. The placer deposit is at an elevation of 6000 feet. Water is pumped to a perpendicular elevation of 1000 feet.

Winston Prospector: The East Pacific mine at Winston has been increasing its output for several months, and the ore is piling up in the bins. The new bunk house, 50x100 feet, for 150 men, is nearly finished.

Garnet News: The shipment of high-grade ores from this district to the smelters continues. An attachment was placed on the Silver Butte mine and plant, near Vermilion, by J. Willis, to secure a claim of \$6148 for merchandise. The Kentucky & Montana M. Co. of Louisville, Ky., owns the Silver Butte properties.

Ciancy Miner: At the B. & G. ore hauling has been resumed and the tramway project has been for the present abandoned. Three cars of ore per week are produced.

Basin Progress: H. L. Frank of Butte has bought a controlling interest in the Basin G. & C. M. Co. At the Eva May the mill is running night and day and ore and concentrates are being shipped to the smelters. At the Bobby Burns the tunnel has reached 600 feet. Out of this mine eighty-four tons of ore brought \$3200.

Virginia City Madisonian: The German Bar Placer M. Co., near Virginia City, closed down for the winter after a successful season's operations. The Conrey Co. will also close. During the season the two companies have acquired a large acreage of placer mining ground, which would indicate that their new devices for mining flat placer ground are commercial successes. They will resume operations with the early spring.

NEVADA.

The West Walker River G. M. Co. in Lyon county has bonded its mines for six months to J. S. Cain of Bodie and R. L. Laws of Hawthorne.

The Dexter of Tuscarora has another shipment of gold bullion and auro-cyanides on the road. The power plant is nearing completion, and the forty stamps will soon be in motion.

The North Mountain M. Co., in White Pine county, shipped 340 pounds of auro-cyanides, valued at \$5600.

At Virginia men are placing the pipe to convey water to the pump at the C. & C. in condition, and the work will be completed before the pump arrives. Supt. Edgar of the Occidental, at the Utah, put six men to work last week. They are running a drift and have struck some good ore.

Pioche Record: Work has resumed on the Peck mill at Bullionville, and it will be ready for operation within thirty days.

Hawthorne Bulletin: The Drinkwater tunnel at Silver Peak last week cut through the big ledge. At the point of crosscutting, the ledge is 60 feet wide, and the ore is estimated to go \$20 per ton. In J. Chiatovich's mine at Silver Peak the ledge is about 6 feet thick, and ore is being extracted.

Virginia Enterprise: A force is employed at the C. & C. shaft, Comstock, overhauling the hoist engine. The machinery is to be placed in good condition, as the lowering of lumber for the drainage boxes will soon begin. A few men have been put to work at the Utah.

Virginia Chronicle: The south lateral branch of the Suro tunnel is to be extended to Silver City to drain the mines of that district between 500 and 600 feet below the present workings. Draining to 500 feet below the present workings of Silver City and Devil's Gate district mines will admit of the extraction of large ore reserves known to exist below the present deepest workings, which are only 200 feet below the surface, the heavy inflow of water causing a suspension of work below that level. The sale of the Golden Eagle mine in Humboldt county to Salt Lake and Chicago mine is about completed. The price is not given.

NEW MEXICO.

Hillsboro Advocate: At Hillsboro the Porter mill is working on seventy tons of Richmond ore. Six dry washers were started in the Hillsboro placers last week. The Eureka Co. is making a sample run of thirty tons of its first class ore at the Porter mill. A thirty-five-ton lot of Freiburg mine second grade ore is being treated at the Charter Oak mill. At the Andrews cyanide mill work began on 500 tons of custom ore from different mines in the district.

Santa Fe New Mexican: The Santa Rita Copper and Iron Co., near Silver City, is shipping 100 tons of iron ore daily to the smelters.

The Cochiti G. M. Co., from one week's run, shipped a gold brick weighing twenty-five pounds. The present capacity is 125 tons daily. Six leaching tanks are being added.

The Snake mine, near Hillsboro, made an eighty-ton shipment to the smelter. The Tripp mine, of Hillsboro, shipped fifty-five tons of \$110 ore. The Mills Tunnel Co., in Grant county, has finished its New Moon shaft at a depth of 175 feet, and are in solid ore. Another shaft of 150 feet will be sunk elsewhere on the property.

The Santa Fe New Mexican states that the most encouraging features in the past year in the advancement in growth and wealth of New Mexico is the increased output of ores from the mines in the Territory, and a consequent development of mining properties.

Silver City Enterprise: At Central the shaft on the Texas mine has reached 485 feet. The mill is working satisfactorily. At Santa Rita on the Hearst mining properties the force will be increased immediately and developing the ore bodies will be pushed.

OREGON.

F. S. Lewis bought the Deer Lodge mine, near Baker City, for \$100,000. There has been 800 feet of work done on the mine and it shows a vein 16 feet thick. It is the purpose of the new owner to drive a tunnel on the vein 2000 feet, securing 1400 feet of overhead stoping. A 40-stamp mill is to be erected.

The Bellvue in Granite county made its last shipments for the season in marketing 950

sacks of concentrates carrying good values in gold and silver.

Canyon City News: The Prairie Diggings property, near Canyon City, has been sold to P. Helmer, who says he will erect a 10-stamp mill and make other improvements early in the spring. There are between 500 and 1000 tons of ore on the ground ready for the mill.

Ashtland Journal: The gold output for Jackson county this year is \$150,000—two-fifths less than last year on account of scarcity of water. Ferguson & Sorrick, who bought the Miller & Dysert and other placer claims on Jump-off-Joe, have incorporated under the name of the Jump-off-Joe G. M. Co. Their new ditch is completed and everything will soon be in shape for the winter's run. Godfrey & Tabor, owners of the Red Boy mine in Baker county, brought into Baker City last week the first clean-up of their new 20-stamp mill, amounting to \$10,000. The mill has been running about two months. H. B. Compton and others recently bought the General Sheridan and Custer quartz claims in the Wolf Creek district, Josephine county. The price is not made public. The ledge shows 12 feet of ore, which is high-grade concentrating. The new owners will begin operations in the spring. The Vindicator M. Co. has made application to the Government for patents to 220 acres of mining ground in Grave Creek district, Josephine county.

Ashtland Tidings: The Lewis mine at Leland is working twenty men. Operations will shortly be resumed on the Basin mine on Briggs Creek. A. Carter has bonded the Anderson mining property on Williams creek for Colorado people. The cleanup at the Sterling hydraulic mine on Alieague is just being completed and operations will soon begin on another season's run. The Booth & Carter mine on Grave creek received a carload of iron pipe last week.

SOUTH DAKOTA.

Deadwood Times: The Garden City cyanide plant is in operation. The ore supply is from the Garden City M. Co.'s ground and from the Rainbow property.

UTAH.

The strike made in the Golden Gate mine at Logan runs \$20.40 in gold and 2½ ounces of silver.

The Sunbeam of Tintic shipped twenty-eight tons of ore last week that yielded \$40.50 per ton.

The Silver City Star reports the shipments of thirty-four carloads of ore from that district for last week. The electric power plant at the Overland mill at Sunshine is finished and the crushing and leaching of ores has begun. The crushers have a capacity for 300 tons a day, though Mgr. Peyton will start with 100 and increase the amount gradually. The present hoisting plant will be replaced by a larger one. On the ore bodies over 2000 feet of work has been done. The assay register shows an average of \$6 per ton in gold and the ore is free from refractory properties. At Marysvale 200 tons of gold ore valued at \$15 a ton are on the Dalton dump, and the amount is increased with each shift. From 50 to 100 tons of red oxide of iron are brought monthly from Monroe, Piute county, to Salt Lake, whence it goes as a pigment to Eastern paint markets. The producers get \$5 per ton for it. About sixty tons of antimony per month are marketed by the lessees of the Antimony mine, near Marysvale. Markets are found at San Francisco on the west and Chicago on the east. The lessees realize a good margin despite the long hauls. The Albion M. Co. at Alta will continue marketing ore through the winter. The lowest returns from the furnace show 18 5/8 per cent lead and 22 ounces silver per ton, while the highest show 63 per cent lead and 67 ounces silver. The ledge is 26 feet.

The Niagara mine at Bingham is marketing 300 tons of good grade ore a month. Mgr. Schenck of the Dalton & Lark bought the Howell placer, Bingham, and work will begin soon.

C. Lammerdsdorf, manager of the Sevier M. Co. of Gold Mountain, reports more activity there in mining than at any time in twenty years. The development of the Holland group will be resumed at once and continue until ores have been blocked out for a mill.

The Red Wing M. Co. has bought nine claims near Bingham. The price is said to be \$100,000.

The Tintic Miner says that eighty cars of ore were shipped last week, and five of concentrates and two bars of gold bullion.

The Bingham Bulletin says the strike at the West Mountain placer is yielding profitable returns. The Dewey mill finished a 200-ton lot of ore from the Red Wing and started on 2000 tons from the Old Telegraph. C. B. Allen is starting work under a lease on the Morning Star No. 2, near Bingham. They have been idle a long time, and the old workings are caved. Hirsh & Snow will do continuous work this winter on the Rosa group. It is giving good milling ore. Crouch & Benedict of the Zelnora are in a body of high grade ore. The York made a 50-ton shipment last week.

The Silver City Star reports shipment of thirty-two carloads of ore.

Tintic Miner: At the Jo Bowers, Eureka, a station has been cut on the 300 level and drifting begun. There is a 2-foot vein of high-grade galena, besides a considerable body of jiggling ore. A shipment of ore was made that showed 41 per cent lead, forty-one ounces silver and 60 cents in gold per ton. This is followed by two others in transit. At Death Canyon in the Happy Jack is a good showing of silver-lead ore, and a shipment is en route. In the Silver Bell in Silver City a vein of high-grade ore has been found which will probably run 200 to 300 ounces to the ton. In the Albion at Alta an 8-foot breast of ore has been opened. At the Bullion-Beck of Eureka in the 1300-foot level the winze is being continued down and is in ore that is good and indicates that it will continue to great depth. On the south the chute in which copper predominates yields an average better

than \$7 in gold, with some silver, per ton.—At Park City the Silver King, supposedly a silver property, outputs over \$11 per ton in gold, and the ore bodies in which it occurs are said to be ten years ahead of the means of smelting and milling them.—At the Star Co.'s mine and mill near Bingham the leaching of ore is in progress. A good percentage of the metal is being saved. The company hope to keep the mill in operation through the winter.—At Mercur the Sacramento has for some time been blocking out ores equally as productive of gold as originally found in the north workings of the Mercur. The company has exposed five ore chutes whose values run \$27 gold per ton.

Park City Record: Supt. Curtis of the Massachusetts started the pumps and power drills last week.—Shipments of ore from the Mackintosh sampler for the past week were 1,438,410 pounds.

WASHINGTON.

Near Kettle Falls the Northport Smelter Co. is doing development work on the south half of the Colville reservation. They are working copper and galena indications with a view to supplying their smelter from this section.—Considerable prospecting is being done on the placer locations on the west banks of the Columbia river near Kettle Falls. The black sand and gravel runs well in colors and an effort is being made to save the fine gold which is readily washed away in the panning process. Preparations are being made to work the property all winter.

At Republic the Golden Harvest is again in ore which yields \$17.50 per ton from average sample. The tunnel is in 305 feet and is 147 feet below the surface. The ledge 7½ feet wide.—The Butte & Boston tunnel continues to give the workmen much trouble on account of the slide rock and slow progress is made.

The Princess Maud tunnel is progressing at the rate of 4½ feet per day.

Near Boundary the Lakeview mine is taking out ore.—J. F. Hall has a force on the White Cap drifting on the ledge, the crosscut having tapped the ledge at 150 feet. The ledge is 3 feet wide with 3 inches of solid ore.

Everett News: F. J. Scougale and J. J. Sheehan returned from Ruby creek, where they have been at work on the placer mines owned by the Everett Hydraulic G. M. Co. of which Mr. Scougale is president. Owing to the wet weather the company stopped on the flume until spring when it will be resumed.

FOREIGN.

BRITISH COLUMBIA.

(Special Correspondence).—The B. C. Ex. Co., Ltd., which acquired the Slough creek

gravel property for \$165,000, has started a three-compartment shaft at the old camp. The ground near the mouth of Slough creek will be tested this winter by a series of bore holes.

A contract has been let to run a drainage tunnel 1600 feet in length on Cornish creek. The owners of this ground are F. C. and H. W. Laird, W. C. Fry, and Eastern people. Mr. Fry is superintending engineer. Laird, at Willow creek, is installing more powerful pumps to replace those drowned last winter.

F. T. Hamshaw has sunk a shaft 80 feet on Summit creek between the Hauser ground and Van Winkle lease. A shaft house, wheel and pump will be completed this winter, and an effort will be made to reach bedrock next summer.

Development is nearly finished on the Burns creek hydraulic, under the management of S. Medlicott. The Slough creek bench hydraulic between Nelson and New creeks, under the same management, is ready for piling early next season. W. Thompson will be in charge this winter while Mr. Medlicott is in England.

On the Bradford, Cariboo & Yukon Co., Ltd., ground on Antler creek, the old channel has been found 19 feet deeper than the present channel, and a drainage and working tunnel started to tap the deep ground; this is in 135 feet. Mgr. H. E. C. Carry has returned from the Yukon and will go to England this winter. In the meantime work is suspended on this property.

The Slocan & Cariboo Co. is putting in a tunnel on Canadian creek, near the mouth. Two shifts are working with M. Windt in charge.

Work will soon be resumed on the Devil's Lake Mining Co., Ltd., placer.

The Cariboo Gold Fields, Ltd., elevator on Williams creek had a very short season, notwithstanding the fact that the season throughout the district was fully up to the average. It is now seen that the volume of water required for elevating 97 feet through a 14-inch throat can be obtained for a period of more than six weeks in the year. As the ditch will furnish a minimum flow of 300 inches at 700 feet head, the company will probably put in an electric power and lighting station and dredge the ground. In this way the working season would be lengthened to six months.

Between Cariboo and Cassiar the vast auriferous area known as Omenica is again coming into prominence. In '71-'72, when labor was from half an ounce to \$20 per day, and transporting supplies from Victoria cost \$1 a pound, about \$2,000,000 was taken out by rocking, drifting and windgunning. Under these conditions only the richest and easiest ground

was worked, and the district was all but abandoned in '73 for the richer diggings in Cassiar and remained so until two years ago. In '96 the 43rd Mining Co., Col. Wright Mgr., and the Victoria Co., Cap. Black Mgr., began work. The efforts of these two companies have been so encouraging that the Hudson's Bay Co. has established a store at Manson creek; the Government is reopening old trails and building new ones, and next summer will expend \$50,000 in making the Fraser, Nechaco and Stewart rivers navigable for steamboats as far as Tatla landing. The cost of transporting supplies from Victoria is now down to 17 cents per pound and next season will be cheaper via Quesnelle. About 100 prospectors were in the district this summer and some good discoveries made, notably on Black river, where 40 rocker diggings are said to have been found, and on the west branch of the Findley. All the prospectors in the vicinity of Fort Graham have gone to the latter strike.

T. R. Moore and C. E. Perry of the St. Anthony Mining Co. have secured an option on the Victoria Co.'s property on Manson creek at \$130,000.

C. McKinnon sold his claim on Lost creek to D. Cumberland for \$5000.

The Chinese Co. on Vital creek sold to Victoria people for \$12,000.

The 43rd Mining Co. will have one elevator at work next spring on Kildare gulch.

J. Kavanaugh worked the Victoria Co.'s hydraulic this season and cleaned up \$1.08 per cubic yard of gravel.

There were three railway surveying parties in Omenica this summer. If a railway enters that field the output of gold from the district will be large within a few years.

Barkerville, B. C., Nov. 5th, '98.

The Rossland Miner is informed that the Second Relief mine at Erie has been sold for \$300,000.—Shipments from the Bosun mine, Slocan, amount to 220 tons.—Ore shipments from Sandon for the week ending Nov. 12th were 805 tons.—The ore shipments at Rossland the past week amounted to 3800 tons. Of that the Le Roi furnished 3000 tons, while the War Eagle contributed 800 tons. For the same period last year the shipments amounted to 1035 tons, and the increase in the twelve-month is over 300 per cent.—Near Nelson, F. W. Garland has been ground sluicing on the Hattie N. claim for twelve months with success. His is the only claim on the creek upon which ground sluicing has been tried.

The Fort Steele Prospector says that the Regina claim, owned by Bracebridge & Co. has been bonded to M. Thompson of Nelson for \$12,000. It is a copper property with a ledge varying from 10 to 20 feet in width.—R. Jaffray of the reorganized Toronto Co.

which controls the Cariboo, camp McKinney, mine, reports that the first two weeks' run of the 20-stamp mill resulted in saving of 870 ounces of gold.

LOWER CALIFORNIA.

The San Juan gold and silver mines on the gulf coast were brought into prominence by the Crazz Bros. of San Jose, Cal., who disposed of their interests several years ago. The present owners are Moraga Bros. of Santa Barbara, Cal., J. A. Altamirano of San Diego, Cal., and H. W. Schramm of Burlington, Iowa. The mines are several hundred miles south of Yuma, on the summit of San Juan mountain, and eighty men are on the payroll. A cable takes the ore from the top of the mountain ten miles to the 25-stamp mill at the coast. The cable system cost \$50,000. The ore contains \$13 to \$14 in gold and about forty-one ounces of silver to the ton. The company is working 132,000 tons of tailings by the bleaching process. The mines are said to have always paid well.

MEXICO.

Globe, Ariz., Times: At Nacosari, Sonora, work has been stopped in the shafts of the United Globe mines on account of water. A tunnel is being run 5000 feet to tap the ore body on which the shafts were being driven. This will cut the ore body 700 feet below and drain the mines. The contemplated railroad which runs to the Sonora line will run to the tunnel. Air drills will be used in the tunnel. A 400-ton smelter is being erected and eight 100 H. P. gas engines will furnish the power.

Nogales Oasis: The Tucaba mine, near Magdalena, Sonora, has a group of claims through which several ledges run. The largest varies from 60 to 150 feet in width and the ore runs from \$7 to \$10 per ton. Another ledge is 16 feet wide, a third 12 feet wide and a fourth 8 feet wide. Over 2000 feet of development work has been done.—Development work in the Animas mine, near Llano, is progressing. High-grade ore is being extracted.—Unwatering the Ahogado mine is in progress.—The Apache mine, near La Dura, is owned by D. A. Richardson & Co. The ledge is about 4 feet in width and the ore is chloride of silver and is paying all costs of development work.—El Cielo mine, near Hermosillo, is being worked with good results by J. Grant & Co. There is a 5-foot ledge which assays \$25 in gold per ton, \$140 silver and a large percentage of lead. A shipment made recently yielded \$16 gold, about \$300 silver and considerable lead. A tunnel has been run on the vein 250 feet long.—The Pan-American M. Co., which bought some years ago the tailings dump, deposited by the old Prietas mill, have worked out all their ground and suspended operations.

5000 lbs.

The weight of the heaviest piece is
1300 lbs.

Capacity, five tons per day.

WHITE, ROGERS & CO.,

Consulting Engineers and Millwrights,

OFFICE, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, \$450, F. O. B., San Francisco.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

— SEND FOR CIRCULARS. —

These Machines are Kept in Stock Ready for Immediate Shipment.

GAS A_ND GASOLINE ENGINES

— FOR —

Pumping, Milling, Lighting, &c., &c.

This cut represents a New and Improved Combined Geared Gasoline Engine and Hoist with Friction Clutch, Differential Band Brake, Speed Regulator Indicator, and all appliances found in Modern Steam Hoists.

For Efficiency, Economy and Durability It is Unequaled.

Hoisting capacities from 1150 to 6000 lbs.; cost of operation, with gasoline at 10 cents a gallon, 1 cent per H. P. per hour. Also furnished in friction if desired.

Special Descriptive Catalogue of Engines -- Pumping, Hoisting, Electric Lighting, Air Compression.

DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can

be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

FRASER & CHALMERS, 155 Fulton St., Chicago, Ill.

The Comet is the best Crusher on account of its range of adjustment. All patent claims of other parties affecting the Comet have been put to rest by final decision of the highest courts.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 17, 1898.

SILVER.—London, 28d; New York, 60½; San Francisco, 60½; Mexican Dollars, 47½@47¾. New York exchange, sight, 15; telegraphic, 17½ cents premium.

LEAD.—New York dispatch, dull, \$3.70 bid, \$3.75 asked. The firm naming the settling price for leading miners and smelters at the West quotes Lead \$3.50.

Local, pipe, 6@6½c; sheet, 6½@7c; pig, 5½c; bar, 6c.

COPPER.—New York reports Lake firm, \$12.87½@12.95 asked.

Imports of copper into the United States for the first nine months of this year compare with the same period in two previous years as follows according to official Government returns:

| | 1898. | 1897. | 1896. |
|--------------------------|-------------|--------------|-------------|
| Ore and regulus, tons. | 1,848 | 3,516 | 1,979 |
| Bars, pigs, ingots, etc. | | | |
| Total value of above | \$9,858,909 | \$10,649,675 | \$8,334,847 |
| Imports | \$3,266,518 | \$1,477,223 | \$950,592 |

The bulk of this year's copper imports was Mexican copper in transit via Arizona for re-exportation to Europe.

IRON.—American, soft, \$21.75 and \$23.75 per ton; Scotch, \$24.25.

SPELTTER.—5½@5¾.

TIN.—Mento Roofing, redipped, \$7; English, to arrive, \$4.50; Pig, 18c; Bar, 19c.

"Although it has attracted less attention than the rise in copper, tin has made a rapid advance in price recently, and, while opinions are divided, there are people in the trade who are predicting a 'boom' in the article," says *London Money*. "The curious thing about the rise in price is that it has been brought about in the face of a smaller export trade, not only for last month, but for the nine completed months of the year, while there are no indications of any increase in consumption in the near future. In other words, the rise is the result of market manipulation, and as the rise is having the effect of bringing the old works into operation again, it appears fairly safe to say that we shall see lower prices for tin in the reasonably near future."

ANTIMONY.—9½, 10.

BABBIT METAL.—10-12-14—best 16c.

QUICKSILVER.—Local dealers report an advance to \$42; export, \$37.00@37.50; carload lots, special rates.

POWDER.—F. o. b., San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1* 60%, carload lots, 13½c; less than one ton, 15½c. No. 1* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

FUSE.—Triple tape, \$5.10 per 1000 feet; double tape, \$4.35; single tape, \$3.45; Hemp, \$3; Cement No. 2, \$4.35; Cement No. 1, \$3.45.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9.

COAL.—San Francisco coast, yard prices:

Wellington.....\$8 00 Coos Bay.....\$5 00
Seattle.....6 00 Southfield.....7 50

Cargo lots, Eastern and foreign:

Wallsend.....\$7 50 Cumberland.....\$8 00
Brymbo.....7 50 Cannel.....9 50

Assessment Notices.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of October, 1898, an assessment (No. 14) of one-half of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 1207 Claus Spreckels building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of November, 1898, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 11th day of December, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. J. CRAWFORD, Secretary.

Office—No. 1209 Claus Spreckels Bldg., San Francisco, California.

CONSOLIDATED ST. GOTHARD GOLD MINING COMPANY.—Location of principal place of business, 113 Crocker building, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of November, 1898, an assessment (No. 16) of Ten Cents (10c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 113 Crocker building, sixth floor, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of December, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 30th day of December, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. F. HOLLING, Secretary.

Office—113 Crocker building, sixth floor, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of November, 1898, an assessment (No. 85) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of December, 1898, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 23rd day of December, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. FRED K. DORROW, Secretary.

Office—Room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of November, 1898, an assessment (No. 2) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 214 Jackson St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of December, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 17th day of January, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

Lunkenheimer's "Clip" Gate Valve.

Single Disc
DOUBLE SEATED.

Made with Screw Ends from 1" to 6",
Flange Ends 2" to 6" sizes.

BEST IN QUALITY.
LOWEST IN PRICE.
THE ENGINEERS' FAVORITE.

These Valves are made of cast iron and all wearing parts of gun metal. They are superior to the common cheap brass valves with which the market is flooded.

WHY?

BECAUSE they possess all the advantages of a cast iron pipe fitting (Elbow, Tee, Coupling, Union, etc.) namely—are heavy and rigid—not injured by expansion and contraction or rough handling in pipe fitting. TAKE PRESSURE FROM EITHER END. Body and hub are held together by a steel clip, consequently always easily taken apart. Joint between body and hub made permanent by an imbedded seamless oval copper wire washer. If you desire the BEST, STRONGEST and MOST DURABLE valve for general purposes on all ordinary pressures, use this valve. IT IS A STANDARD FITTING OF GREAT APPEARANCE and FULLY WARRANTED TO SATISFY. Made also in All Iron for Cyanide Plants. Try them and be convinced. Specify them and order through your dealer. Our Catalogue of superior Steam Specialties FREE for the asking.

UNFAIR COMPETITION.

Our recent announcement that inferior goods had been sold and billed on the coast as our goods, and that our trade-mark numbers had been counterfeited, has disclosed an even greater extent of these practices than we had supposed to exist. To make the resulting damage to the reputation of our goods as small as possible and to protect our would be patrons we repeat:

All our catalogue goods, except those listed by us as manufactured by others, are stamped with our name "Keuffel & Esser Co." or our initials "K. & E. Co." and where there is room for it, with our trade mark.

Our German drawing instruments bear only the trade marks  or . We never stamp our goods with catalogue numbers only, and goods so stamped are therefore not ours. All our goods are fully warranted to conform to the description we give of them in our catalogue and to be of the quality and grade specified. We make some lines of cheaper goods for the jobbing trade, but they differ from our catalogue goods in quality and appearance. These inferior goods are not stamped with any of our trade marks. Our catalogue goods are not furnished to any dealer or agent without our complete stamp as described above, and any claim that we furnish our catalogue goods by special arrangement without our stamp is therefore an attempt to deceive. Our special papers in rolls or sheets

are watermarked or stamped along the edge with their name. Any claims that our papers are furnished by us in bulk without these names or that these papers have been obtained otherwise than through us, are absolutely false. We will thankfully accept any information bearing on the counterfeiting of our trade-mark numbers or the palming off of other goods as ours.

Very respectfully, KEUFFEL & ESSER CO.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all.

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

Yours respectfully,

ROBT. WALKER, Superintendent.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt.

Very truly yours,

Per G. M. WILDE, Acting Superintendent.

Mining and Marketing Mica.

In the construction of electrical machinery and other industries, the use of mica is increasing. Like

is placed over the mouth of each pit, upon which a man sits, awaiting the signal from below to haul up the basket containing the mica and refuse dug from the pit by a rude pick. On arrival at the surface

thrown in another heap. The tests as to whether the mica is good for anything, or whether, as the natives say, "it is alive," are its firmness, specific gravity, and the power of reflecting the countenance free of contortions. The latter test shows the perfect parallelism of its individual plates and consequent likelihood to split well. The heavier the mineral and the more perfect the reflection, the more valuable is the mineral considered. All the plates not standing the necessary test are of a soft and flimsy nature, without any of the brilliant sparkle of the better sort, and is called by the natives "dead mica."

When the vein of mica-bearing quartz, lying between rocks of different formation, has been found, little "nigger-heads"—small lumps of crumbling mica mixed with slate and other rock—are plentiful. The rock is examined by a native miner, a blast is made, the rock and debris are cleared away, and, ordinarily, appears a block of mica, a ragged corner showing black and glittering in the white quartz in which it is imbedded. With his fingers the miner brushes away the dirt and small stones which partly cover it. Its thickness is carefully noted, its position in the rock is slowly and patiently discussed, no one is in a hurry, and many a speculation is indulged in as to its size and quality. A hole is quickly drilled, and all eagerly crowd around, as one of the men with his pick pulls away the broken stone—a good-sized block, and if solid and of perfect cleavage, will be worth many dollars. The excitement is not allayed, and will not be until the block is split open and they know how it looks on the inside. It is considered bad to split open a block at the mine and contrary to all rules, for there is danger that the fine, polished faces will be scratched and a sheet—thin, indeed, but valuable—will have to be taken off

SCENE AT A MICA MINE IN INDIA, SHOWING LABORERS AT WORK.

other mineral products, its development in the United States is retarded by the ability to import it cheaper than it can be locally produced. Mica is found in California, Idaho and other States, the chief supply, so far as this country is concerned, being from New Hampshire and North Carolina. Its commercial value, especially for electric purposes, lies in the size of the sheets, and for this reason, as well as the cheapness of production, the bulk of the world's mica is brought from India. Behar mica from Hazaribagh, Gaya and Monghyr, in India, was exported last year to the amount of 2,000,000 pounds, of which the greater part was exported from Calcutta, chiefly to Great Britain and America.

Herewith are presented two engravings graphically portraying the general appearance of an East India mica mine and manner of preparation. These engravings are from photographs "taken on the spot." As will be seen the method of mining is primitive. The wild hill tribes ascend to the top of a selected hill and sink a series of pits the whole way down the profile of the hill, about 3 feet in diameter each, a few feet apart. These pits are not continued vertically downwards, but in a zigzag shape, but not so much out of a vertical line that a basket containing the mineral can not be hauled up from the bottom of the pit. The zigzag shape of the shaft is formed by sinking the shaft, first inclining to the left a few feet and then to the right, the head of each cut or notch forming a landing place or step. The projecting of salient angles of the notches form a flight of steps from the top to the bottom of the pit, which seldom reaches to a greater depth than 40 feet, when, as darkness interferes with the workman's progress, the pit is forsaken and another begun a few feet farther down the hill. A slight framework of faggots, cut from neighboring trees,

the good and bad materials are separated. The earth and rubbish are shot down the precipitous side of the hill, and the good mica, in ragged masses

NATIVES TRIMMING MICA IN AN INDIAN MINING VILLAGE.

about 1½ feet in length, 6 inches broad and 3 inches in thickness, after having its ragged edges trimmed off with a reaping-hook looking instrument, is placed by itself in a heap, and the poor or softer kind

and thrown away. The plates of mica are generally brought to the miners' village, and there, after being slightly trimmed with grass-cutting knives (which are not particularly adapted to the purpose,

but are probably the only ones the people are able to purchase), are sorted into different heaps, according to quality and size. The quality depends on the mineral being in a perfectly unaltered condition, its transparency and freedom from cloudiness caused by internal foreign matter, the absence of minor cleavages which render it liable to split into ribbons and triangles and the planeness of its fissile surfaces.

Under the present system of working, the blocks of mica raised from the mine are cleaned of all extraneous matter, such as quartz and feldspar, in the stripping room; and when split, either for convenience of size or for the removal of material included along the cleavage planes, the sheets are sent to be "scribed" and afterwards cut with a pair of shears into rectangular shapes along the scribing. Sheets, tin, zinc or iron are used as patterns in scribing.

The mines are near the interior and are almost inaccessible. The Abruker mine produces the finest mica, both for lamination and color. That mine has been sunk about 200 feet, following the dip of the vein. As elsewhere, no machinery of any kind, except drills and hammers, is used in the mining operations. The refuse and the mica are placed in baskets, which hold about ten pounds, and are passed from hand to hand by women who stand in line on ladders. When the top is reached the baskets are dumped and returned down the ladder in the same manner, but by another line of women. Water is taken out by jugs. There is reason to believe that there has not been any change in this method of operation for many hundred years, except that more care is taken to protect the miners.

As in this country and Canada, mica occurs in small plates in many of the crystalline and metamorphic rocks of India, but the large crystals of commercial value occur associated with felspar and quartz, forming an excessively coarse-grained granite, or pegmatite, and frequently intruded into older granites, or into metamorphic rocks. The felspar, which is often orthoclase, but sometimes oligoclase, occurs in large crystals, while the quartz, which was the last formed mineral in the group, occurs in large crystalline masses, but without crystalline outlines. It was moulded around the pre-existing mica and felspar crystals, and frequently are found striated surfaces in the shafts, which are in reality the casts in quartz of mica-bundles. That these intrusions have been affected by subsequent earth movements seems undoubted, since the mica sheets are so frequently crumpled; but, at the same time, it does not seem likely that these movements could have been of very great magnitude, otherwise the delicate sheets of mica would have been still more distorted; neither the very flexible mica nor the friable felspar could resist any serious earth movements.

The Miners' Convention.

The seventh annual convention of the California State Miners' Association met in San Francisco this week. It was called to order on the 21st inst. by President Neff, who read a review of the record of the Association, and made pleasant reference to the future. Secretary Sonntag and Treasurer Hendy made their annual reports, which showed that at the beginning of the year there remained unexpended in the treasury \$777.09; during the year receipts were \$2322.50, expenses \$1450.06, leaving \$1649.53 on hand to date and all bills paid.

There was much enthusiasm among the 570 delegates and an earnest of hearty co-operation. The usual committees were appointed and the chairmen of the several standing committees reported progress during the year. On the 22nd inst. the Committee on Resolutions reported recommending the appointment of a committee of five to consider the question of storage of water; the creation of a committee of seven to arrange for appropriate representation of the mineral industries of California at the Paris Exposition in 1900; again urging the passage by Congress of an Act creating the Department of Mines and Mining, the Secretary to be a member of the Cabinet; requesting the co-operation of the Association with the State Mineralogist in the preparation of county maps, etc.; thanking President Neff for his services; referring to the Committee on Legislation the report of the Mineral Lands Committee; urging the Speaker of the House of Representatives and the House Committee on Rules to set a day at the coming short session of Congress for the consideration of H. R. 3655, and asking the next California Legislature to pass a similar resolution. The report was adopted as read. Several speeches were made, and the Committee on Debris Dams made the following report:

Mr. President.—The Committee on Debris Dams respectfully submit the following report:

Since the adjournment of the convention of 1897, considerable progress has been made by the various officials whose duties involve action under the mining bill of 1893, providing for the building of restraining barriers and the resumption of hydraulic mining. Soon after the committee was appointed, a communication addressed to Senator George C. Perkins and Congressmen De Vries and Hilborn bearing date of January 7, 1898, emanating from General John M. Wilson, Chief of Engineers, U. S. A., was received; and as it involved matters of great interest, a special meeting was held to consider its contents.

After reciting the history of mining legislation, both national and State, Gen. Wilson gave the assurance that "the Debris Commission are pushing their surveys and researches as rapidly as is consistent with the thorough investigation necessary for a full and careful consideration of this most important and complicated problem," and that he would "impress upon the Debris Commission the importance of advancing the work assigned to them by law as rapidly as is consistent with its importance."

Reference was also made to the peculiar wording of the Act of Congress of June 3, 1896, which authorized the Treasurer of the United States to receive from the State of California any and all sums of money that have been, or may be hereafter, appropriated by this State for the construction of restraining barriers. And in this connection he says: "While it is stated that \$250,000 has been appropriated by the State of California, it is not known that such sum has been deposited with the Treasurer of the United States, or made available in accordance with the terms of the law."

As this seemed to be one cause of delay, the committee submitted a reply, setting forth the provisions of our Constitution and of the law passed at the last session of the Legislature, in which it was clearly shown that California had done all it could to make the appropriation available, leaving with the Federal authorities the choice of time for drawing the same by commencing the building of the much-desired dams.

The California delegation took up the subject immediately and caused the passage of a law which removed all impediments and made it practicable for the United States to then proceed with work with every assurance that the cost thereof would be promptly shared by our State to the extent of the sum mentioned.

Following this and in accordance with the assurances we have referred to, surveys and investigations were commenced and were actively in progress, when the late war with Spain called the officers engaged therein to other and for the time more important duties.

The cessation of hostilities brought about a resumption of the researches of the Commission. This morning your committee in a body, accompanied by the distinguished Congressman from the Second Dis-

trict, Hon. Marion De Vries, called upon Major W. H. Heuer of the California Debris Commission, for the purpose of discussing the situation, as far as it was consistent for him to do so. We found Major Heuer disposed to assist the committee to the extent that circumstances permitted.

Work is now under way which, it is hoped, will be completed in time to present an early report to Congress.

So far as outlined, surveys have shown that there is at the Narrows on the Yuba river, one of the proposed sites for a restraining dam, a varying depth of from 50 to 80 feet from the present bed of the river.

The present appropriation would construct the foundation and probably raise the dam about 90 feet above the bed of the stream.

We are informed that a project is now under investigation contemplating a ditch and tunnel 50 feet in width for diverting the water from the Yuba river at this proposed dam and carrying same to Reed creek, about twelve miles distant, at which place there exists capacity for the impounding of a vast amount of debris, running into hundreds of millions of cubic yards. The feasibility of this project has not as yet been demonstrated.

From all the committee can gather, an additional appropriation will certainly be needed, either for the construction of a dam higher than 90 feet, as above indicated, or for the proposed ditch and tunnel and restraining barriers on Reed creek.

In our judgment this amount cannot now be fixed at less than \$500,000. This, of course, it must be understood, is not based on official information.

At this time the Committee cannot state, even approximately, the date of the transmission of the report of the California Debris Commission to the Chief of Engineers, for action. Several causes have unfortunately caused unavoidable delay. The war has already been suggested as one; the other is found in the change of the personnel of the Commission lately made by the transfer of Col. Suter to Boston, and the assignment of Col. Mansfield for duty on this coast and as a member of said Commission.

We feel, however, that the utmost haste consistent with a proper consideration of the work to be done, is being made by the Commission. Hasty work often delays progress, and as often defeats the object sought to be attained.

That the Department and the Commission appreciate the necessity for action is apparent; and that progress has been, and is being made, is certain.

Patience and a continuation of the efforts made up to the present should be our aim for the future.

We are pleased to note the existing good feeling among miners and those interested in the industry, as well as the confidence they possess in the ability of the Commission to deal with the difficult problems committed to its charge for solution.

This feeling should be supplemented by an endeavor to remove all possible difficulties that may arise. One that now occurs to us as a result of our conference is that of vested rights in the streams and lands where the proposed dams are to be located.

Action should be taken by this Association to bring about an understanding with all the owners of such rights, and such steps as may be necessary should be inaugurated at the next session of the Legislature.

We also recommend that efforts be made both in Congress and in California to secure the additional amount hereinbefore named.

The report was adopted.

During the session addresses were delivered by the Mayor of San Francisco, the Governor of the State and other distinguished men. On the afternoon of the 22d officers were elected as follows: President, Jacob H. Neff of Placer; vice-president, W. C. Ralston of San Francisco; treasurer, Samuel J. Hendy of San Francisco; secretary, E. H. Benjamin of Alameda. The last-named office was the only one for which there were two candidates, there being a good-humored contest between the adherents of Mr. Benjamin and Mr. Turner of Nevada. The vote stood: Benjamin, 320; Turner, 249; and on motion the former's election was made unanimous.

The State Mineralogist's proffer of the free use for the Association's secretary of a room in the new quarters of the State Mining Bureau in the Market Street Ferry Building was accepted with thanks. After the usual complimentary resolutions, presentations, etc., and the appointment by the respective counties of their membership on the State Executive Committee, the convention adjourned.

The work of the California State Miners' Association goes on through the year, through the executive committee, the special and standing committees and the officers, and the annual sessions of the convention are mainly to hear reports, note necessities, make mutual suggestions and determine collectively upon the general outline of needed work for the coming year.

Concentrates.

CALIFORNIA miners welcome the rain.

COLORADO calls Gilpin Co. "the Cornwall of North America." In the Gillen placers near Elizabethtown, N. M., last week a \$100 gold nugget was found.

TWENTY-FIVE tons antimonial ore from Marysville, Utah, arrived in San Francisco this week for reduction.

THE War Eagle mine at Roseland, B. C., marketed in the past year \$700,000 worth of ore and paid \$151,500 in dividends.

THE deepest vertical shaft in Montana is the Green Mountain at Butte. It is 2100 feet, and is being driven still deeper.

THE Smuggler-Union mine of Telluride, Colo., took the prize at the Omaha Exposition for the best display of a free gold specimen.

ELECTRICIANS in general know of but three ways of producing a current—connection, electrolytic conduction, and metallic conduction.

NEARLY every mine in Marshal, Savage and Gold King basins, San Miguel county, Colo., are connected with Telluride by telephone.

THE Rio Grande ore sampler at Cripple Creek has installed electricity, the first sampler introducing it, from the Colo. Electric Power Co.

At Halley, Idaho, local mining men estimate that J. L. Packard, in developing the Tip Top mine, will have spent \$300,000 before getting any returns.

By the falling of a 4000-pound rock on the 700 level of the Strong mine at Victor, Colo., this week, O. C. Wood was crushed to almost instant death.

GENERALLY speaking, a mill test is more for the purpose of determining the best way to work the ore, while the assay is to determine the value of the ore.

THE statement in the daily press this week that agents of the Rothschilds had bonded a portion of the Mariposa grant is denied by those in best position to know.

THE Meldrum tunnel at Telluride, Colo., being driven from both sides of the mountain, is making 10 to 15 feet every twenty-four hours. Air drills are in use.

WINTER posts, thirty miles apart have been established by the police from Lake Bennett to Dawson, N. W. T. Dog trains will travel between them and carry mail.

THE output per miner in the different coal fields of Prussia in 1897 were as follows: Upper Silesia, 353 tons; Lower Silesia, 220 tons; Ruhr, 282 tons; Saar, 241 tons.

OLD miners say that it is practically impossible to prospect in the Yukon region during May and June, owing to the swarms of mosquitoes that harass one day and night.

A PUMP is being placed in the Butte & Boston mine at Butte said to be the largest in Montana. The water cylinders are 17 in. diameter, 21 in. stroke, and the weight is 70,000 pounds.

THE use in public for the benefit of others of an invention, the success of which is previously demonstrated, made more than two years before the application, bars the grant of a patent.

THE new three-compartment Diamond shaft of the Anaconda, Montana, Co. is to go 2000 feet deep, and a third monster hoisting engine is now being built in San Francisco therefor.

THE Creede, Colo., *Candle* says that the mines of that camp are mostly worked on the leasing system and are all successful; under former management they were run in debt and passed into receiver's hands.

THE British American Corporation has acquired the 205,000 shares of the allied Turner interests in the Le Roi M. Co. of Roseland, B. C., at \$7.25 a share, paying \$1 in cash, \$2.62½ in thirty days, and the balance July 1, '99.

WHEN a river forks into two or more branches, some miners say that the source of the gold is often found in the right hand branch. Another theory, not uncommon, is that the spots upon which the sun shines before noon are richest in gold.

THE largest tin mine in the world is situated on Sulo Brani, an island in the bay of Singapore. It turns out monthly 1200 tons of tin—more than the product of Cornwall, and more than that of Australia. The ore comes from Selangor and Perak in Malacca.

OUR "candid opinion" regarding Tesla's claim as set forth in last week's issue, and on page 530 of this issue, is that while such fanciful hypothesis fascinates the mind, yet rigid ruling of scientific analysis precludes permanent place for so romantic an idea.

"FORCE" may be defined as action between two or more bodies causing, or tending to cause, rest or motion: "work" is the combination of force and motion: "power" the speed of doing work. A "machine" is a device that will transmit and modify motion and force.

THE museum of the California State Mining Bureau on Fourth street, San Francisco, is open daily, (Sundays excepted), free to all from 10 A. M. to 5 P. M. The museum is an exposition of the mineral wealth not only of California, but of the Pacific coast generally.

THE Denver, Colo., *Republican* says that the mixture for preventing fumes in mining powder which has been patented by R. Crowe of Georgetown, Colo., consists of 50 per cent unbolts wheat flour, 25 per cent common salt finely ground, and 25 per cent pulverized bicarbonate of soda.

THE amount of dividends paid incorporated mining companies in the United States and British Columbia for the first ten months of '98, is \$17,685,150, which probably represents about one-third the total amount of dividends for mining properties in those countries for that time.

THE production of German coal in six years has increased 30 per cent; coke 50 per cent, and fuel 80 per cent. In the Ruhr basin the coal output in 1897 was 48,424,000 tons; number of miners 176,101; output per miner 275 tons. The output of coke was 6,872,000 tons, and of patent fuel 944,000 tons.

TOTAL credence can not be given technical books on mining, so far as data or details of mining operations are concerned in connection with present working; for, however accurate or reliable they may have been at the time of their preparation, the great advance in economic methods rapidly makes such works obsolete.

THE Salt Lake *Tribune* says that G. S. Peyton was the first to master the ores at the Mercur, Utah, mine, and laid the

W. C. RALSTON, VICE-PRESIDENT CALIFORNIA STATE MINERS' ASSOCIATION.

foundation for the introduction of the cyanide process in Utah, and, with the knowledge that many years of experience have brought him, promises to show even further reductions in the cost of treating a ton of Mercur ore.

REPORTS from Tacoma, Washington, are that the Rothschilds (as usual) and D. O. Mills will reorganize the Tacoma Smelter & Refining Co. and increase the capacity of the plant to four times its present size, the work to begin shortly. It is further stated that the smelter will be controlled by the Bunker Hill and Sullivan mine of Wardner, Idaho, and the Alaska-Treadwell and Alaska-Mexican mines of Alaska.

RECENT discoveries of free-milling gold ore in the Buffalo Hump and Thunder Mountain districts in northern Idaho have caused a stampede of miners from Florence, Marcus, Elk City, Lewiston and adjacent districts. These discoveries have been made along the old trail leading to the Florence and Marcus diggings, over which many miners and prospectors passed during the excitement of '62.

A NEW compound of aluminum and zinc, called "alzone," is said to possess some excellent qualities. The tensile strength of the material is from 24,000 to 25,000 pounds per square inch. It is rigid, and possesses very little ductility. It may serve as a substitute for cast brass in nearly every instance where cast brass is serviceable, but cannot take the place of soft brasses, since it possesses little ductility.

THE eight Lake Superior producing copper mines in Houghton Co., Mich., are Calumet & Hecla, Quincy, Osceola, Tamarack, Wolverine, Centennial, Franklin and Atlantic; in these there are 9266 shareholders. The aggregate market value of these eight mines is about \$85,000,000; to date the total dividend disbursements amount to \$73,782,000, with the present rate of distribution about \$5,500,000 per annum.

ABOUT as good a record as any in shaft sinking was made last July by F. C. Roberts and E. H. Garthwaite, two California miners, at the Nigel Deep mine in Heidelberg district, S. A. R., driving a 14x7 shaft from 946 to 1206 feet depth—260 feet—in thirty-one days from July 1 to July 31 inclusive. The vertical depth of the shaft at the latter date was 975 feet. After leaving the incline the rock was hoisted up 700 feet vertically.

IT is the opinion of some who have studied the subject practically that the idea generally accepted that because an ore deposit has been formed on what may be called a "true fissure-vein," it necessarily has an indefinite extension in depth, is in the nature of a fallacy, and that the extension in depth of ore in a fissure is as likely to terminate within a measurable distance as the extent of ore deposition on what are generally called "blanket deposits."

THE Banner mine at Oroville, Cal., is said to be the deepest mine in the State, taking sea level as the base. The bottoming of the contemplated 3500-foot shaft on the Kennedy mine at Jackson, Cal., will be 1500 feet below the sea level. "Concentrates" believes, however, that Supt. Gassaway at the Magalia mine, Butte Co., has gone deeper than, so far, any miner in the State, a portion of his workings now being nearly 4000 feet below the surface.

THE recent sale of Russian platinum mines to French purchasers was on the basis of productiveness; estimating a ton of platinum from \$798,250 to \$957,900, a mine yearly yielding 360 lbs. was considered worth from \$123,750 to \$154,500; a mine with an annual output of 625 lbs. was valued at from \$309,000 to \$386,250. During '97 a platinum group in the Urals yielded about six tons. Of Russia's seven platinum deposits, five are now under French ownership.

Industrielle Nachrichten says that boring for brine at Darnstedt, in Saxony, has been resumed after an interval of two years. The bore hole was begun in 1890, and has attained a depth of 3280 feet. It yields thirty-three litres per minute of brine, containing 27 per cent of salt. Boring operations are to be continued until the bed of rock salt, from which the brine must be derived, is encountered. The cost of the bore hole has already amounted to £5000.

The world production of nickel in 1889 and 1896 is given as follows:

| | 1889, Tons. | 1896, Tons. |
|-------------------------------|----------------|----------------|
| Sweden and Norway..... | 89 | 20 |
| Germany..... | 282 | 822 |
| United States and Canada..... | 409 | 1700 |
| New Caledonia..... | 1050 | 1950 |
| Totals..... | 1830 | 4492 |

COPPER mines which a few years ago were practically aban-

doned as being too poor and expensive to operate at a profit, are now yielding good returns to their owners. Instead of operating on a small scale with the rich ore-streaks in a vein, it is now found much more profitable to work the whole vein, notwithstanding the fact that the average yield of copper throughout a deposit so worked may not yield over 3 or 4 per cent., and even (in the case of the Atlantic mine at Lake Superior,) does not reach 1½ per cent. The average present cost of producing copper is under nine cents a pound, and many of the larger mines are able to furnish it at a cost of less than 6 cents. It is to-day quoted at 13 cents.

THE former government ruling admitting patent on groups of mining claims, on one of which \$500 worth of work or improvements had been done, was superseded on Dec. 17, '97, by a new ruling from the Secretary of the Interior and the Commissioner of the General Land Office making it necessary to have \$500 work done for each claim before patent could issue. Subsequently the operation of that latter ruling was suspended, upon numerous requests from miners everywhere, to go into effect July 1, '98. Since that date it is necessary to make satisfactory showing that for each claim in a group for which patent is asked, \$500 in work or improvements has been expended, though, as before, all the work may have been done on one claim for the joint improvement or development of the specified group.

QUESTIONS of fact regarding general mining law are cheerfully answered, but it is obviously impossible to correctly or satisfactorily solve special problems herein involving ownership and property rights in individual cases. In such cases arbitration or expert legal advice is suggested. In the case of the Altona Q. M. Co. vs. Integral Q. M. Co., 114 Cal., 100, Aug. 20, '96, which is similar to the instance regarding which query is made, the Supreme Court of California held that where a mine is idle the services of a watchman in looking after the property and taking care of the same may constitute work upon the claim sufficient to hold it, if such care was necessary to preserve tunnels, buildings or any structure erected to work the mine. But if there was only the naked claim to be looked after and a watchman was placed there merely to warn prospectors and thus prevent a relocation, it would not be labor upon the mine in the sense of the statute.

WHEN a casting cools off, its uneven shrinking sets up internal strains which are finally balanced against each other, so that the casting will, after that, retain its form. The interior portion of a lathe-bed, for instance, may, when the bed has cooled, want to shrink more than the previously cooled upper and lower edges will allow it to do, and the different portions of the casting will be all the while trying to stretch or to compress each other, and the final shape which the casting will take if left to itself is that in which the different portions are balanced. The fight between them is, however, not settled as soon as the casting is cooled by any means, but it continues for a long time afterward and dies very gradually, the form of the casting continuing to change slightly for a long while, in some cases for months. The molecules composing the iron are simply settling into their final places and it takes them a long while to do it.

THE U. S. Geological Survey at Washington, D. C., desires it said that the geologic folios now being issued (and which have been editorially noticed herein) are sold at 25 cents each, remittance of that exact amount to be made by money order payable to the Director of the U. S. Geological Survey, or by currency. Postage stamps, checks or drafts will not be accepted. The folios should be ordered by number. No. 1 is the Livingston, Montana, folio; No. 3, Placerville, Cal.; 5, Sacramento, Cal.; 9, Anthracite-Crested Butte, Colo., (the price of this folio is 50 cents); 11, Jackson, Cal.; 15, Lassen Peak, Cal.; 17, Marysville, Cal.; 18, Smartsville, Cal.; 24, Three Forks, Mont., (50 cents); 29, Nevada City, Cal., (50 cents); 30, Yellowstone National Park, Wyo., (75 cents); 31, Pyramid Peak, Cal. The following more recent issues are unnumbered in the circular: Bidwell Bar, Cal., folio; Boise, Idaho; Butte, special, Mont., (50 cents); Downieville, Cal.; Pueblo, Col.; Sonora, Cal.; Telluride, Colo.; Tenmile Dist., Colo.; Truckee, Cal. All communications should be addressed: The Director, U. S. Geological Survey, Washington, D. C.

In pamphlet form has been issued the recent reports of superintendents of Comstock, Nev., mines to the Comstock Pumping Association, the expert testimony on which the Association largely based their project. In the pamphlet is an excellent illustration of the Evans hydraulic elevator, and a brief description of the plan by which it is proposed to unwater the old bonanza lode to a point 500 feet below the present water level. The brief business proposition of the Risdon Iron Works of San Francisco was a pleasure and a surprise in cost to the Pumping Association, which had secured pledges of \$100,000 as a preliminary. The Risdon Iron Works offered to essay the work for \$30,000, contingent upon success, and are going ahead, incidentally receiving considerable advertising therefrom, as the proposed drainage has attracted considerable attention and there is naturally curiosity regarding the apparatus with which it is proposed to do the work. The pamphlet gives a good deal of interesting data as to the condition of the Comstock, from men well qualified to write concerning it.

A GOOD test for oil is to place single drops of different oils in line upon a piece of plate glass about 2 feet to 2 feet 6 inches long, one end being raised about 6 to 8 inches to form an inclined plane. This test should be conducted in a room where there is little or no dust. The drops of oil start from the top of the inclined plane upon a race with each other. The first day sperm oil will be found in the rear, but after a time it will overtake the others, and be found in motion even after some others have dried up. An oil having a light body runs quickly and dries quickly, but an oil that has both a body and a free flow will readily be detected by this test. An oil may have a good body and yet tend to gum badly, which quality will also be easily detected on the glass. A test for the presence of acids is to put small quantities of oil in copper dishes, which are easily made by depressing bits of sheet copper with round-faced hammers. If acid is present, it will attack the copper and produce verdigris. As a result of experiments carefully made and extending over a year, it was found that iron was least affected by seal oil, and most by olive oil. Mineral lubricating oil has no action on zinc and copper, acts least on brass and most on lead. Lard oil acts least on tin and most on copper. Sperm oil acts least on brass and most on zinc.

Some Notes on the Recovery of Gold from Cyanide Solutions.

Written for the MINING AND SCIENTIFIC PRESS by SHERARD COWPER-COLES, Assoc. Inst. M. M., London, Eng.

One of the chief difficulties appertaining to the economical recovery of gold from weak cyanide solutions by electrolysis has been the electrodes.* If several lead anode sheets are cut superimposed, the strips cling together, and have to be carefully spread out one by one, so that the surface may be exposed to the solution. A clean-up is made every seven or eight weeks, when the wood frames carrying the lead strips are withdrawn, the lead strips removed and new substituted, the auriferous lead being ultimately melted down and conveyed to a central works to be cupelled. This method is both crude and expensive; the labor of fitting the strips into the frames is considerable, and the consumption of lead is a considerable item, having been computed by Mr. Von Gernet at the Worcester mine at 1.10 of a penny per ton of ore treated, and by Mr. Williams at the Crown Reef Gold Mining Company at 1.75.

The cathode should fulfill the following conditions: I. The gold should be adherent during the process of decomposition. II. The gold should be capable of being readily stripped after removal from the electrolyzing cell. III. The cathode should be electro-positive to the gold in solution, to ensure the cathode being coated with gold on immersion.

These conditions are fulfilled, I find, by substituting an aluminum cathode for a lead one, advantage being taken of the fact that a loose film of oxide is very rapidly formed on aluminum, the difficulty in soldering and electroplating aluminum for this reason being well known. The substitution of aluminum for lead foil, or strip, enables the gold to be obtained as pure gold, and daily returns to be made of the amount of gold recovered; it also has the additional advantage of reducing the cost of labor and economizing the amount of cyanide of potassium used, as the solution is not contaminated by any base metal such as zinc. The deposition of gold from a cyanide bath on to an aluminum plate proceeds in a uniform manner, but in such a way that the gold is deposited as a metallic sheet, which is easily detachable, when desired, from the aluminum cathode by stripping or peeling, or rubbing, almost as soon as it is formed, and if the aluminum cathode consist of a sheet of the metal fixed to a revolving drum or cylinder, by varying the rate of rotation the film of gold can be brushed or removed from off the cathode continuously, so that the process is an automatic one, resulting in the immediate and continuous recovery of the gold without any subsequent cupellation of the lead as in the older electrolytic process.

The process has therefore in it the elements of economic working coupled with the quick recovery of the valuable gold. In the Siemens-Halske process the lead cathodes remain some weeks in the bath, and the gold, which only then amounts to about one-tenth the weight of the cathode, is only recoverable therefrom after a second further operation of smelting and cupellation. In the Siemens-Halske process lead was chosen as the cathode, as it has the property of allowing the gold to adhere to it. In the aluminum process aluminum is used as the cathode, as it permits of the easy removal of the gold film. In the former process the gold has to be won from the lead by a secondary operation; in the latter the gold is directly obtained in the form of a pure foil without any further expense or trouble. Gold by this process has been successfully extracted from cyanide solutions containing only 0.01 per cent of cyanide of potassium and 2½ dwts. of gold to the ton of solution. The best results are obtained when the solution is raised to a temperature of about 100° F. It is also found advantageous to use a greater current density with the necessary increased voltage when the aluminum plates have been freshly placed in the solution, so as to ensure their being covered with a film of gold as quickly as possible, otherwise there is a tendency for aluminum hydrate to be formed. In about ten hours an extraction of 95 per cent was obtained by the use of aluminum cathodes, the amount of gold in solution before electrolysis being 2½ dwts. to the ton of solution and the strength of cyanide 0.01 per cent and the rate of flow about 15 gallons per 100 hours for every cubic foot of electrolyzing cell, or 3 square feet of cathode service. Gold has been deposited on aluminum cathodes from solutions containing only 0.0075 per cent of cyanide of potassium, the current density per square foot being 0.03 and the E. M. F. at the poles of the generator 6 volts.

The following are the results obtained from gold cyanide solutions of varying strengths with aluminum cathodes and iron anodes:

First Experiment.—A cyanide solution containing 3.2 grams 2 dwts. gold per gallon and 22.71 grams per gallon of potassium cyanide, or 0.5 per cent solution, was electrolyzed. The aluminum cathode had an area of half a square foot, and two similar-sized iron plates

formed the anodes, placed 1½ inches from the cathode, the amperage being 1.50 and the voltage 1.40 at the terminals of the electrolyzing cell. The gold began at once to deposit on the aluminum cathode as a bright coherent coating, and the deposition was allowed to continue for fifteen minutes, when the amperage was found to be 2.0 and the voltage 3.40. The layer of gold could be completely and easily detached by rubbing gently with a piece of india rubber tubing fixed on a glass rod. A fresh cathode was then inserted.

| | P. M. | Amperes, per sq. ft. | Volts. |
|------------------------|-------|----------------------|--------|
| Time of immersion..... | 1:05 | 3.10 | 4.40 |
| Taken out..... | 1:20 | 3.20 | 4.60 |

The gold was removed from this cathode, and a fresh one inserted without changing the conditions.

| | P. M. | Amperes, per sq. ft. | Volts. |
|----------------|-------|----------------------|--------|
| Taken out..... | 1:50 | 2.60 | 4.70 |

As gold still continued to be deposited, the experiment was continued.

| | P. M. | Amperes, per sq. ft. | Volts. |
|------------------------|-------|----------------------|--------|
| Time of immersion..... | 2:20 | 2.80 | 4.70 |
| Taken out..... | 2:55 | 2.60 | 4.80 |
| Time of immersion..... | 3:00 | 2.30 | 4.60 |
| Taken out..... | 4:00 | 2.20 | 4.90 |
| Time of immersion..... | 4:15 | 2.60 | 4.90 |
| Taken out..... | 5:15 | 2.00 | 4.90 |

The whole quantity of gold recovered in these six experiments was well washed to remove traces of potassium cyanide and then weighed.

| | Grams. | Per cent. |
|-----------------|--------|-----------|
| Gold added..... | 2.200 | 100 |
| Gold found..... | 2.7108 | 84.70 |

It will thus be seen that 84.70 per cent of the total gold was recovered from the solution in 3 hours 35 minutes, using an average amperage of 2.51 per plate, or a current density of 5.02 amperes, and an average voltage of 4.63.

Second Experiment.—In this experiment a weaker solution of potassium cyanide, containing 11.35 grams per gallon = 0.25 per cent solution, was employed. The percentage of gold was nearly doubled, viz., 91 grains = 5.94 grams = 3.80 dwts. per gallon.

The experiment was divided into two portions, the yield of gold at each stage being determined:

| | Amps. | per sq. ft. | Volts. |
|------------------------|------------|-------------|--------|
| First Stage— | | | |
| Time of immersion..... | 11:15 a.m. | 3.00 | 4.75 |
| Taken out..... | 1:05 p.m. | 2.00 | 5.10 |
| Second Stage— | | | |
| Time of immersion..... | 1:20 p.m. | 2.10 | 4.90 |
| Taken out..... | 3:40 p.m. | 2.00 | 4.80 |

The experiment had to be discontinued at this stage, owing to a short circuit taking place within the cell. The gold recovered:

| | |
|------------------------------------|------------------------------|
| First stage, in 1 hr. 50 min..... | 3.005 grams = 50.59 per cent |
| Second stage, in 1 hr. 20 min..... | 0.875 gram = 14.73 per cent |

A total quantity of gold amounting to 65.32 per cent was, therefore, recovered in 4 hours and 10 minutes, although it will be noted that the greater part of the gold was deposited in the first two hours.

Third Experiment.—A solution containing 6 dwts. of gold per gallon and 32.71 grams of potassium cyanide, being a 0.5 per cent solution, was employed. The gold was deposited in three stages, and weighed separately, as follows:

| | P. M. | Amps. | per sq. ft. | Volts. |
|---|-------|-------|-------------|--------|
| First Stage— | | | | |
| Time of immersion..... | 5:30 | 6.25 | 4.30 | |
| Taken out..... | 6:00 | 5.20 | 4.10 | |
| Gold deposited, 2.930 grams = 32.02 per cent. | | | | |
| Second Stage— | | | | |
| Time of immersion..... | 6:12 | 4.80 | 4.10 | |
| Taken out..... | 6:45 | 4.20 | 4.30 | |
| Gold deposited, 1.340 grams = 14.68 per cent. | | | | |
| Third Stage— | | | | |
| Time of immersion..... | 6:55 | 2.20 | 2.30 | |
| Taken out..... | 8:45 | 2.10 | 2.30 | |
| Gold deposited, 2.085 grams = 22.46 per cent. | | | | |

Thus 69.13 per cent of gold was recovered in 3 hours 33 minutes, and the greater part was also deposited in the first half, viz., 32.02 per cent.

The experiments demonstrate that the process affords a quick method for depositing gold from its cyanide solutions, and also show that it is easy to remove the film of metallic gold from the aluminum cathode by mechanical means.

In another experiment some gold tailings were carefully assayed, and found to yield a button of gold equivalent to 1.4 gram gold per 1000 kilograms, or, approximately, 1 dwts. per ton.

The quantity of tailings used for the experiment was 90 lbs. This quantity was placed in a suitable vat and treated by the well known methods for extracting the gold by means of a cyanide solution. The tailings were first leached with a weak caustic soda solution containing 4 ozs. caustic per ton of water, and after its removal, a cyanide solution containing 0.5 per cent KCN was added. This solution was allowed to leach the tailings for several hours, and was then drawn off into an electrolytic vat. The tailings were then leached dry for some hours, in order to ensure a complete solution of the gold, and the double cyanide so formed was leached out with a weak cyanide solution containing 0.18 per cent KCN. After this solution had been drawn off into the electrolytic tank, the last traces of the gold solution were washed into the vat with water. The time occupied for the whole operation was 50 hours, so that it represented the same time as is used in actual practice on a commercial scale. The total amount of liquors obtained in this way and submitted

to electrolysis amounted to about 50 litres, or about 11 gallons, or about half the weight of the tailings treated.

From the above assay the theoretical quantity of gold which should be extracted from the above weight of tailings is 0.056 gram, or one-thirtieth of a dwts. On submitting the solution to electrolysis a current of 0.29–0.31 ampere was employed, at a pressure of between six and seven volts. As the area of the aluminum cathode was approximately one square foot, the current density corresponds to the amperes. The electrolysis was allowed to proceed for seven hours, and at the end of that time the gold was seen covering the whole of the cathode as a very bright golden deposit of extreme thinness. Notwithstanding the thinness of the film it was found possible to detach it mechanically.

Report of the War Eagle Mine.

Jno. B. Hastings, manager War Eagle mine, Rossland, B. C., reports that from October 1, 1897, to October 1, 1898, the following work was done:

| | |
|---|---------|
| 3,480 feet of tunneling, average cost per foot..... | \$21 15 |
| 451 feet of raising, " " " " " " " " " " | 29 78 |
| 185 feet of sinking, " " " " " " " " " " | 96 25 |
| 4,117 feet total. | |

From driving these headings 2316 tons of ore was produced and shipped.

The work done during the past year added to former headings makes a total of:

| | |
|------------------------------|-------|
| Tunneling, feet..... | 3,304 |
| Raising, " " " " " " " " " " | 851 |
| Sinking, " " " " " " " " " " | 665 |
| Total..... | 4,820 |

This does not include 250 feet of the main work shaft timbered through the stopes from the 250-foot level to the surface.

The smelting conditions were such that regular stoping in the mine and ore shipments were not begun during the year until May. Besides the ore above mentioned, there were produced and shipped from stopes 26,559 dry tons at an average cost per ton of \$3.24; the total shipments for the year aggregate 28,875 tons.

| | |
|----------------------------------|------------|
| Average gross smelter value..... | \$ 20 01 |
| Total smelter's gross value..... | 570,744 23 |

The gross market value per ton of the ore in metals were: Gold, \$18.90; silver, \$1.15; copper, \$3.46½. Total, \$23.52.

The following table gives the total production of the mine. The gross market value is the actual value of the gold at \$20.67 per ounce, silver at New York quotations, and copper at New York price for casting, the difference between this column and "smelter's gross value" being a smelting and marketing charge; the amount is shown under the heading of indirect smelting charge.

PRODUCT OF THE WAR EAGLE MINE, CHARGES AND VALUE PER TON.

| Year. | Net Value. | Direct Smelting Charge. | Smelter's Gross Value. | Smelting Charge Indirect. | Actual Total Smelting Charge. | Gross Market Value. |

SOME valuable tests have been recently made by La Chatelier, of Paris, in connection with the combustion of acetylene and air mixtures. He has found that a mixture containing less than 7.7 per cent of acetylene burned with a yellow flame, the brightness increasing with increased acetylene contents, and the combustion being perfect. A mixture which contained above 7.7 per cent and up to 17.3 per cent of acetylene burned with a blue flame, the products of combustion being, besides water and carbonic acid, carbonic oxide and hydrogen. With contents of 17.3 per cent, a part of the mixture remained unburned and carbon was separated. The separation of 25 per cent took place in the form of a dense black vapor. With increased acetylene up to 57 per cent the mixture remained explosible, explosibility beginning with 2.7 per cent, while a coal gas and air mixture required at least a gas proportion of 8.1 per cent in order to be explosive.

*The cathode is usually lead, and the anode iron, but in Mr. Andred's process he has reversed the order, the anode being peroxidized lead plates, and the cathode iron.

The Refining of Base Lead Bullion Containing Silver, and High in Gold.*

NUMBER IV.

By G. H. BLAKEMORE.

Weight of Crusts.—The following series of figures show what amount of alloy is found in the various crusts, from the zinc added:

FIRST GOLD CRUST.

| Actual Weight of Charge, Tons. | Assay Value Per Ton. | | Weight of Zinc Used, Lbs. | Weight of Crust Skimmed Off, Lbs. | Per Cent of Crust on Charge. |
|--------------------------------|----------------------|--------|---------------------------|-----------------------------------|------------------------------|

| 12.01 | 12.25 | 143.03 | 495 | 3894 | 14.47 |
| 11.05 | 24.04 | 246.98 | 667 | 6154 | 24.85 |
| 10.21 | 13.34 | 154.52 | 480 | 4016 | 17.54 |

Sample assays of the first silver crusts have been previously given to show how some gold always remains behind with the silver crust. For this reason, efforts to make a "gold" crust (as distinguished from a "silver" crust) are not advisable in bullion rich in gold. The limit of gold that will pay to separate out of fine silver by parting small quantities, in Australia is about 8 ozs. of gold in every ton of silver, anything under that will not pay to extract, and is therefore lost to the producer. In parting very large quantities of dore, say 12,000 ozs. daily, about 4 ozs. of gold would pay to work for.

The next part of the refinery work is that of

Liquating the Crusts.—In many of the old plants, the liquating of the crusts was done in kettles, built in alongside the desilverizing kettle. There were two of them, one to receive the crust and the other to hold the lead as it separated out from the crust in the first kettle. A glance at such an arrangement will show its faults. As soon as the lead began to separate out from the crust in the first kettle, the dry alloy had to float on top of a bath of molten lead until skimmed off, and it was therefore undergoing all the time it lay there a gradual impoverishment of its gold and silver values, and necessarily enriching the lead below. The want of sense in this is plain, because after having gone to the expense of taking the gold and silver out of the bullion, it was a queer thing to go to some bother in driving a portion of that silver and gold back into the bullion again.

In modern plants the "liquating" or "sweating" or "drying" of the crusts is done in small reverberatory furnaces. The hearth is formed of cast-iron plate, set on a slope, with the edges of the long sides turned up some 4 inches. The plate is cast slightly "V" shape, so that, as the lead separates out, it can run down the sloping bottom and deliver into a kettle separately fired, which stands outside the furnace. The plate is laid on a brisque bottom and has a fall of about 4 inches in its length, the fall being from the fire bridge to the catchment kettle. The size of the furnace, like all the rest of the plant, depends on the work it has to do. A furnace capable of working half-ton charges is quite large enough for a refinery handling about 100 tons of bullion weekly.

After the furnace is charged with the crust to be liquated, the heat is raised to just the melting point of lead, and kept below the point at which the zinc alloy will melt.

In half an hour, lead begins to drip from the delivery spout. The latter is kept heated by a fire built round it to prevent the lead solidifying in the chan-

nel and blocking it. At intervals the crust in the furnace is well turned over to expose fresh surfaces to the heat, and in about two hours the crust is as "dry" as it is advisable to make it. Making the crust too "dry" interferes afterwards in the re-torting operation. As the catchment kettle fills up, the "sweat lead" is baled out into bars and stacked until enough has gathered to make a kettle charge. It is then melted up and desilverized; the crust from this poor lead being too low in silver to liquate, it is therefore returned to the next charge of rich bullion as part of the zinc necessary for its desilverization.

As soon as the charge in the liquating furnace is "dry" enough, it is raked out and let fall over a slanting, perforated plate to break it up into small pieces about marble size. It is then weighed and tipped into the "alloy bin."

The following figures will show how the crust loses in weight on liquating. Each charge was 1120 lbs. and the figures given are the weights of "dry alloy" obtained from each charge:

| Dry Gold Crust Alloy Obtained. | | Dry Silver Crust Alloy Obtained. | |
|--------------------------------|--|----------------------------------|--|
| Lbs. | | Lbs. | |
| 510 | | 487 | |
| 450 | | 484 | |
| 520 | | 560 | |
| 542 | | 480 | |
| 633 | | 422 | |
| 666 | | 348 | |
| 707 | | 504 | |
| 646 | | 519 | |
| 661 | | 524 | |
| 595 | | 404 | |
| 672 | | 448 | |
| 600 | | 323 | |

Slightly more alloy is obtained from gold crusts than silver crusts, and it is particularly advisable not to sweat the gold crusts too much, more so than with silver crusts for the reasons before given.

Assays of the alloy and "sweat lead" obtained from same in the liquation process are as follows:

| Assays from Gold Crust. | | Sweat Lead from Gold Crust. | | Remarks. |
|-------------------------|--------|-----------------------------|------|----------------------------------|
| Ag. | Au. | Ag. | Au. | |
| 1047.66 | 209.45 | 6.92 | tr. | |
| 1105.66 | 329.12 | 17.07 | 4.20 | Overheated in liquation furnace. |

| 1513.64 | 298.15 | 21.68 | .01 | |
| 1064.10 | 307.25 | 7.22 | .04 | |
| 1439.96 | 149.10 | 7.04 | tr. | |
| 2014.85 | 164.55 | 15.53 | tr. | |

SILVER CRUST ALLOY AND SWEAT LEAD ASSAYS.

| Alloy. | | Sweat Lead. | | Remarks. |
|---------|------|-------------|-----|-------------|
| Ag. | Au. | Ag. | Au. | |
| 2077.61 | 0.25 | 3.98 | tr. | |
| 2010.41 | 0.27 | | | |
| 1765.64 | 0.10 | 11.94 | tr. | |
| 1949.12 | 0.18 | | | |
| 1351.90 | 0.18 | 1.84 | tr. | |
| 2081.37 | 0.25 | 7.10 | tr. | |
| 1505.90 | 0.08 | 2.19 | tr. | |
| 701.04 | 0.10 | | | |
| 1977.79 | tr. | 25.10 | tr. | Overheated. |
| 2005.52 | 0.06 | 41.89 | tr. | Overheated. |
| 2111.10 | 0.10 | 11.49 | tr. | |
| 1614.00 | 0.46 | 15.89 | tr. | Overheated. |

In both the gold crust and the silver crust, several instances have been given of overheating the crust in the liquation furnace to illustrate plainly what the result is. The whole secret in liquation is simply to pay ordinary attention to the fire, and not to let it get so hot as to melt any of the zinc alloy and the assays of the sweat lead must then be low. A glance at the lead in the catchment kettle will always show if the charge has been overheated, because if it has, the peculiar bluish cream of a zinc crust shows on the top of the lead. This should always be skimmed off and returned to the liquating furnace.

The coal consumption is trifling; about 250 lbs. per ton of crust is sufficient to do the work.

(To be Continued.)

Not a "New" Method.

In the issue of the 5th inst., on page 452, appeared an article condensed from a monograph read at the October session of the American Institute of Mining Engineers, at Buffalo, N. Y., by R. E. Chism, entitled "A New Assay for Mercury." Under date of the 9th inst., Mr. A. S. Additor writes from Ashland, Or.:

"In regard to 'new' method of mercury assay, I was much surprised to see it headed 'New.' I have used the exact method there described for several years with the following modifications: Instead of a tin shield to protect water from the heat, I use a piece of asbestos, and I have a die with which I press the piece of thin silver foil into a shape just to fit top of retort; for this I use the same kind of cup

as writer, making a space between the foil and top boat contain the water of about 1.5 millimeters. I use in cooling boat small pieces of ice, and, as soon as melted, replace by another piece. Have always had excellent results, and never knew but what others were using same method. I tried it as an experiment several years ago, and it was so simple that I never thought but what others had tried the same thing. At first I used gold to collect upon, but found that silver answered just as well. In a series of experiments to determine whether silver was as adaptable to the use as gold, I found that there was about $\frac{1}{10}$ of 1% in favor of the gold."

One of the World's Gold Fields---The Silver Peak Mines.

Written for the MINING AND SCIENTIFIC PRESS.

These mines, to which attention is being attracted by reason of the enormous developments recently made, are situated in Esmeralda county, Nevada, about forty-five miles southeast of Candelaria, a station on the line of the Carson & Colorado Railroad. The mines were located in 1864 by Seymour and Rienzi Hughes, two California prospectors, who were attracted to the eastern slope of the Sierras at the time of the opening of the mines at Esmeralda (now known as Aurora), and who, not finding an opening in the camp at Esmeralda satisfactory to them, pushed boldly out into the desert to the east, and after hardships innumerable were attracted to the great range now known as the Red mountains, and upon examining the same were rewarded by finding the immense outcrop of gold-bearing quartz which is the distinguishing characteristic of the principal ledges in this group.

After developing the same by a few cuts and testing their ores, they made known their discovery and within a comparatively short time arranged a sale of the property, it going to an Eastern company, some of the principal owners in same being John I. Blair of New Jersey, Samuel J. Tilden and W. B. Ogden.

A small testing mill was built and in 1866 a 30-stamp mill was put in (old style, light stamps). This mill was operated until 1869, at an enormous expense—an indication of the difficulties to be overcome being that freight on the mill first put in, which was hauled by teams from Sacramento, via Placerville, Genoa and down through the desert, was 25 cents per pound. This expensive freight, coupled with the high cost of labor and material of all kinds, the lack of rapid communication, and the desert character of the country, made all costs connected with mining, transporting and milling the ores extremely high, and, although the ore milled some \$16 to \$17 and was opened on the surface in enormous quantities, costs could not be covered and the property was closed down in 1869.

Some of the owners being dissatisfied, Mr. John I. Blair gradually took in the interests of the others, until the property belonged to him entirely, designing to keep it, so we are told, for his boy. Mr. Blair is ninety-six and his boy is over seventy years old. This, however, showing his faith in the value and extent of the property. The property laid idle, practically speaking, until 1881, when, upon the advent of the Carson & Colorado Railroad in the county, the costs were much cheapened. Mr. John Chatovich, an energetic and enterprising man, who had interests in the neighborhood, secured a lease on the property and operated it for a number of years, extracting and milling a considerable amount of good ore. He first introduced the cyanide process in Esmeralda county for the treatment of the ores after amalgamation, and worked up a large body of tailings that had been accumulated.

In 1891, Mr. I. R. Wasson, an experienced miner, was placed in charge of the property by Mr. Blair, and allowed to operate the mines and mill under the express injunction that he must make it pay its way and not call on the home office for any assistance. There having been no development work done, all the mining have been quarrying on the surface, flat broke, and with a mill out of repair and antiquated in design, this was not a very flattering outlook; but by perseverance and hard knocks Mr. Wasson finally got things to going in a small way and took out about 2000 tons of ore which milled \$20 per ton, and from the proceeds paid to Mr. Blair the first dividends he ever recovered from the property.

In 1894 Mr. Wasson bonded the property to other parties, and up to the fall of 1897 considerable work was done, some ore taken out, the property visited by many experts, the usual pulling and hauling indulged in by the operators, a large amount of wind expended, and nothing done.

In the spring of 1898, at the earnest solicitation of Mr. Wasson, Mr. Blair authorized him to drive a crosscut tunnel which had been planned, to tap the ledges 750 feet below the croppings. Work was commenced and has been prosecuted continuously, and on October 1, 1898, the hanging wall was cut and the tunnel continued to crosscut the vein. On October 27th the footwall of the vein was reached, and the vein proven to be 70 feet wide of solid ore,

*Australasian Institute Mining Engineers.

the average value of the ore, aside from the rich streaks and the sulphurets, being about \$15 per ton in gold.

One streak has been cut by tunnel in the vein, showing from 2 to 6 inches wide, that is extremely rich, the quartz being full of free gold worth anywhere from \$1000 per ton upward. The sulphurets run from \$200 to \$600 per ton in gold. The work is being prosecuted as rapidly as possible, to determine the full extent of the parallel veins and their value, but sufficient is now known to demonstrate beyond question that one of the great gold mines of the world has its locus in Esmeralda county, Nevada.

The mineral district in which these mines are situated is about eight miles long and two miles wide, and is largely an altered granite formation, in some instances capped with lime.

The veins, of which there are two principal ones, with innumerable offshoots, spurs and smaller parallel veins, run generally southeasterly and southwesterly, with a northeasterly dip at an angle of about 45 degrees outcropping boldly for about two miles, and on the northern slope of the mountain.

The country rock forming the hanging wall of the north vein has been eroded, leaving the vein exposed, laying on the surface for hundreds of feet.

On the surface the north or Drinkwater vein shows an average width of about 16 feet, the back or Soldier Boy vein shows about 24 feet thick, these veins on the surface being about 80 feet apart.

The quartz is hard but friable, carrying gold and a little silver, the bullion produced being worth about \$15 per oz.; a large percentage of the gold is free. The sulphurets, which run up to 2 and 3%, being worth \$200 to \$600 per ton; no copper present, and occasional spangles of lead.

In addition to the claims held by the Silver Peak Company there are a large number of undeveloped properties and prospects, and some very well developed and opened mines, among these may be mentioned the Mary mine, belonging to John Chatovich, which, with a 5-foot ledge of \$9 to \$20 ore, keeps a 10 stamp mill in constant operation, the ore being hauled about ten miles from mine to mill. At the Leidy & McAfee mine, where they have recently opened by stripping for 300 feet on the surface two parallel veins, each about 12 inches wide, with 10 inches to 12 inches of waste between them, the ore is expected to mill \$200 per ton. Valcalda Bros.' claim is producing a considerable amount of \$40 ore. The O'Hale property has produced considerable, and there are many others.

The production of the district has been about \$1,000,000 in gold, but the introduction of modern methods and appliances will cause a very great increase. Mine timbers are plentiful. Wood is not abundant, but is in considerable supply about twelve miles distant. Water is scarce at the mines, but a plentiful supply for a large mill can be had by piping same about twelve miles from Cave canyon. A large body of fair quality coal is available about fifteen miles from the mines which can be made available for power by generating electricity at the mines with the slack and poor qualities of coal, using "gas producers," and conducting same by wire to the mine—this being to the mind of the writer preferable to the long distance (thirty miles) transmission advocated by some, from Indian creek, using water power, which during some winter months cannot be depended upon on account of cold weather, and would require a very heavy expenditure to put into operation. The enormous amount of ore developed, comparatively good grade, the facilities at hand, insure the immediate and thorough equipment of this property and is assumption of its rank as one of the great gold producers of the world. Undoubtedly the other mines of the district will receive attention as well, and we may look forward to the opening of many valuable mines in this mineral belt, which has been neglected and overlooked so long, and, coupled with the other developments in the county, will put Esmeralda county in the front rank as a gold producer.

Nov. 5th, '98.

S. A. KNAPP.

The Cause of Failures in Mining.

The question is often asked: "What is the most common cause of failure in mining?" The majority of answers probably are: "Want of a good mine on which to work." But one who is a close observer and has observed the methods of mine management in various regions might question whether a better answer would not be: "Want of good mine management." So many instances are remembered where failures can be attributed to this cause alone that the answer is at least worthy of consideration.

Bad management takes such a multitude of shapes that it is almost impossible to describe it; unless it is described in the general term "ignorance of mining." Its constant form is seen in the wasting of ore. A general proof of the facts is found in the hundreds of ore dumps which have been hand sorted over and over at a profit, and there are hundreds yet untouched that will pay handsome returns. There is an old saying that a workman can be known by his chips, and with equal truth it can be said a bad

mine manager can be known by his dumps. One thing that is indispensable in a mine manager is an appreciation of the necessity of thoroughly understanding the nature and value of his ore. He may not be able to understand the ore himself, but if he appreciates its importance he can employ some one who does understand it to take charge of the necessary work.

The world sees the evidence of waste in the dumps that lie on the surface, but there is a still greater source of waste that is hidden from the public in the dark stopes of the mine. Every practical man knows how often the ore is knocked down in the stopes and there partially sorted, and the supposed waste left upon the stulls. If ore sorted by daylight loses much of its value in the waste, what is the loss liable to be in the dark, narrow and cramped stopes? Who that is competent to hand-sort ore gives, in the great majority of instances, any attention to this portion of the work?

As a rule the miner is allowed to have his own sweet will in this labor, and his own sweet will is too often to do that which is easiest, instead of that which is best, even if he knows what is best. This is but one kind of waste, and the commonest one, of bad management, where scores might be mentioned. It is not all mines that require the constant services of an assayer, but a good many more than receive them do require them, and would find them the most valuable of all possible investments.

Tesla's Latest Claim.

NUMBER II.

In last week's issue appeared the first installment of a verbatim statement from Nikola Tesla in his application for a patent. After a detailed recital of the proposed method and device, he says: What I claim is—

1. The improvement in the art of controlling the movements and operation of a vessel or vehicle herein described, which consists in producing waves or disturbances which are conveyed to the vessel by the natural media, actuating thereby suitable apparatus on the vessel and effecting the control of the propelling engine, the steering and other mechanism by the operation of the said apparatus, as set forth.

2. The improvement in the art of controlling the movements and operation of a vessel or vehicle, herein described, which consists in establishing a region of waves or disturbances, and actuating, by their influence exerted at a distance, the devices on such vessel or vehicle, which control the propelling, steering and other mechanism thereon, as set forth.

3. The improvement in the art of controlling the movements and operation of a vessel or vehicle, herein described, which consists in establishing a region of electrical waves or disturbances, and actuating, by their influence exerted at a distance, the devices on said vessel or vehicle, which control the propelling, steering and other mechanism thereon, as set forth.

4. The improvement in the art of controlling the movements and operation of a vessel or vehicle, herein described, which consists in providing on the vessel a circuit controlling the propelling, steering and other mechanism, adjusting or rendering such circuit sensitive to waves or disturbances of a definite character, establishing a region of such waves or disturbances, and rendering by their means the controlling circuit active or inactive, as set forth.

5. The combination with a source of electrical waves or disturbances of a moving vessel or vehicle, and mechanism thereon for propelling, steering or operating the same, and a controlling apparatus adapted to be actuated by the influence of the said waves or disturbances at a distance from the source, as set forth.

6. The combination with a source of electrical waves or disturbances of a moving vessel or vehicle, mechanism for propelling, steering or operating the same, a circuit and means therein for controlling said mechanism and means for rendering said circuit active or inactive through the influence of the said waves or disturbances exerted at a distance from the source, as set forth.

7. The combination with a source of electrical waves or disturbances and means for starting and stopping the same of a vessel or vehicle, propelling and steering mechanism carried thereby, a circuit containing or connected with means for controlling the operation of said mechanism and adjusted or rendered sensitive to the waves or disturbances of the source, as set forth.

8. The combination with a source of electrical waves or disturbances and means for starting and stopping the operation of the same, of a vessel or vehicle, propelling and steering mechanism carried thereby, local circuits controlling said mechanisms, a circuit sensitive to the waves or disturbances of the source and means therein adapted to control the said local circuits, as and for the purpose set forth.

9. The sensitive device herein described comprising in construction a receptacle containing a material such as particles of oxidized metal forming a part of the circuit, and means for turning the same end for end when the material has been rendered

sensitive by the passage through it of an electric discharge, as set forth.

10. The sensitive device herein described, comprising in combination a receptacle containing a material such as particles of oxidized metal forming a part of an electric circuit, an electro-magnet in said circuit and devices controlled thereby for turning the receptacle end for end when said magnet is energized, as set forth.

11. The sensitive device herein described, comprising in combination a receptacle containing a material such as particles of oxidized metal forming part of an electric circuit, a motor for rotating the receptacle, an electro-magnet in circuit with the material and an escapement controlled by said magnet and adapted to permit a half revolution of the receptacle when the said magnet is energized, as set forth.

12. The combination with a movable body or vehicle, of a propelling motor, a steering motor and electrical contacts carried by a moving portion of the steering mechanism, and adapted in certain positions of the latter to interrupt the circuit of the propelling motor, a local circuit and means connected therewith for controlling the steering motor, and a circuit controlling the local circuit and means for rendering said controlling circuit sensitive to the influence of electric waves or disturbances exerted at a distance from their source, as set forth.

13. The combination with the steering motor, a local circuit for directing current through the same in opposite directions, a controlling circuit rendered sensitive to the influence of electric waves or disturbances exerted at a distance from their source, a motor in circuit with the steering motor, but adapted to run always in the same direction, and a local circuit or circuits controlled by said motor, as set forth.

Uranium.

Uranium is obtained chiefly from the mineral pitchblende, an oxide of uranium, but generally contains small quantities of other metals, as the following results of the analysis of a typical specimen show:

| | Per Cent. |
|-----------------------|-----------|
| Oxide of uranium..... | 79.15 |
| Lead..... | 6.30 |
| Silica..... | 5.30 |
| Iron..... | 3.03 |
| Lime..... | 2.81 |
| Arsenic..... | 1.13 |
| Magnesia..... | 0.46 |
| Bismuth..... | 0.65 |
| Water..... | |
| Selenium..... | |
| Manganese..... | 1.27 |
| Carbon..... | |
| Total..... | 100.00 |

It is now prepared by calcining uranium nitrate in a porcelain crucible until a reddish-colored mixture of the sesquioxide and green oxide (W_2O_3) is formed. The mixed oxides are thoroughly ground with a slight excess of pulverized charcoal and tightly packed in a carbon crucible. On subjecting the charged crucible to an electric current of about 450 amperes and 60 volts, the reduction is completed in a few minutes. The metal thus obtained is not pure, but contains carbon in amounts which vary between 5 per cent and 14 per cent. This carbide has a brilliant fracture and great hardness, and when thrown on a slab of porcelain, or closely pulverized and shaken in a glass flask, exhibits the singular property of discharging copious showers of sparks, resembling those displayed when freshly reduced iron is quickly moved about in air. The fusing point of uranium carbide is very high—much higher than that of platinum—and the alloy will probably be found to possess advantages over platinum for use in pyrometers and similar instruments. Carbide of uranium would make a splendid alloy with steel, and if it could be obtained cheaply it would probably supersede nickel and wolfram in the manufacture of high-class steel.

Pure uranium is a perfectly white, non-magnetic metal which takes a good polish, and can be easily scratched with a file. When subjected to high temperature it is much more volatile than iron. Finely powdered uranium takes fire in an atmosphere of fluorine, and is attacked by chlorine, bromine and iodine at different high temperatures. It is also completely burnt in an atmosphere of oxygen at a temperature of 170° C. At high temperatures uranium directly combines with nitrogen.

An alloy of uranium and a small quantity of silver, copper or lead is used in the manufacture of a yellow glass which arrests chemically active light rays. It is employed in making windows for chemical laboratories and photographic developing rooms, and for bottles and flasks for holding substances sensitive to light. The salts of uranium are largely used in photography and as chemical reagents. Some of them are used in glass painting for making apple-green tints, and in porcelain painting for producing black tints. Recent researches in chemistry and physics have made us familiar with the properties of a number of new or rare metals, but few of them possess so many valuable properties as uranium, and it is to be regretted it is so sparingly and irregularly distributed.

Costs of California Milling and Mining.

The following data were furnished by John Ross, Jr., superintendent of the Wildman and Hector mines at Sutter Creek, Amador county, with mills of thirty and forty stamps respectively, and show what may be accomplished by skillful and careful management in well-equipped properties. It is republished, by request, from the issue of Dec. 26th, '96:

DETAILED AVERAGE COST OF MINING ONE TON OF ORE AT THE WILDMAN MINE, SUTTER CREEK, 1895. JOHN ROSS, JR., SUPERINTENDENT.

| | Cost Per Ton, Cents. | Total Cost for 31,391 Tons. |
|---------------------------|----------------------|-----------------------------|
| Timbers | 16.0 | \$ 5,016.30 |
| Spilling | 4.8 | 1,512.08 |
| Lumber | 2.2 | 687.57 |
| Charcoal | 1.7 | 530.95 |
| Candles | 2.1 | 659.25 |
| Powder | 4.8 | 1,533.65 |
| Fuse | 1.1 | 355.00 |
| Caps | 0.9 | 282.60 |
| Water for power | 9.9 | 3,119.45 |
| Freight | 2.9 | 916.61 |
| Iron | 1.1 | 337.62 |
| Steel | 0.7 | 231.18 |
| Hardware | 2.4 | 765.66 |
| Oil | 0.8 | 249.60 |
| Grease and tar | 0.2 | 67.12 |
| Coal | 0.2 | 78.00 |
| Miscellaneous | 3.4 | 1,067.68 |
| Surveying | 1.3 | 233.37 |
| Power drill machinery | 3.2 | 1,026.50 |

Personal.

C. R. SMITH is Supt. App mine, Quartz, Cal. S. JONES becomes Supt. Badger mine, Mercur, Utah.

A. V. OLIVER will be Supt. Little Hope mine, Oroville, Cal.

C. BROWN has been appointed Supt. Sunbeam mine, Tintic, Utah.

W. M. NESBIT has been appointed Supt. Bullion-Beck Tunnel Co., Eureka, Utah.

H. A. COHEN, Mercur, Utah, has resigned as Gen. Mgr. of Capt. DeLamar's mining interests.

A. P. BRAYTON JR., of the Pelton Water Wheel Company returned from Japan of the steamer Doric.

D. B. HUNT, Supt. Milkmaid mine, French Gulch, Cal., has returned from San Francisco to Redding, Cal.

H. VISCHER of the U. S. Debris Commission is inspecting restraining dams in Sierra and Plumas counties, Cal.

P. G. GOW, Pres. Jumper M. Co., Stent, Cal., has returned to San Francisco from a visit to his properties.

G. STAYTON has resigned as Supt. Republican mine, Jacksonville, Cal. He will be succeeded by A. M. McDonald.

H. A. KELLAR has returned from a professional visit to South America, and will shortly open an office in San Francisco.

W. A. BALLARD, business manager of the Colliery Engineer Publishing Co., of Scranton, Pa., is touring the coast, and is at present in San Francisco.

R. CHILCOTT, Treas. Black Butte Q. S. M. Co., Cottage Grove, Or., is in New York to arrange for the sale of the output of the mine, which is said to amount to \$30,000 a month.

Heroism Recognized.

On the afternoon of the first day of the convention in San Francisco of the California State Miners' Association, on the 21st inst., Chas. G. Yale took the platform and read the following:

WHEREAS, At the time of the recent disastrous fire in the compressor house at the mouth of the tunnel of the Eureka drift mine, on the Forest Hill divide, Placer county, Cal., upon finding that the buildings would be destroyed, Felix Chappellet Jr., superintendent of the mine, knowing that four men were in what might be a dangerous position, ran for 2500 feet through the tunnel and up a 300-foot upraise to where the men were at work, bringing them out through the smoke and flame in safety; be it

Resolved, That our fellow member, Felix Chappellet Sr., already noted as among our most skillful drift miners, be congratulated upon having a son who "is a chip of the old block," and, though only a young man of 21, possessing the bravery to do a noble action with self-sacrifice and promptness.

Resolved, That the miners of California, in convention assembled, recognize the hero-

ism of this young native son of California, and of a distinguished sire, and desire to congratulate him upon so bravely doing his duty to the men under his charge.

Amid multitudinous cheering, a motion to pass the resolution "by a rising vote" was responded to by the 600 delegates springing to their feet.

Coast Industrial Notes.

—The Sacramento, Cal., S. P. car shops will be rebuilt there.

—A Port Angeles, Wash., firm has secured an order for 500,000 cedar shingles from Honolulu, U. S. A.

—Snow in the mountains and rain in the valleys during the week have been general in California.

—The Baldwin Hotel, San Francisco, was destroyed by fire on the 23d inst., loss \$1,500,000, insurance \$100,000.

—But one bid was received by the Seattle, Wash., Board of Public Works to build the proposed \$1,200,000 water supply system.

—The Puget Sound Dredging Co., Seattle, Wash., has purchased the entire plant and all patent rights there of the Bowers Dredging Co.

—The surveyors of the Vancouver, Victoria & Eastern Railway have located the line through Midway, B. C., and are continuing the survey up Boundary creek.

—The railroad grade from Kingman, Ariz., to the White Hills is being cross-sectioned by surveyors preparatory to grading. The road may be extended from White Hills to Temple Bar, another twenty-five miles.

—The Great Northern railway is surveying a line from Trail to Sayward, B. C. It is proposed to run a branch line from the Nelson road to the Trail smelter to carry ores from the Salmon River and Ymir districts, competing with the C. P. R. E. It is also proposed by the Great Northern to put a steamer on the Columbia river between Northport, Waneta, Sayward, Trail and Waterloo, to carry ores from any point on the river to either of the two smelters.

—In the central and western portions of the Los Angeles, Cal., oil fields something over forty new wells have been put down. While they are not all producing, some, among the deeper ones, are producing more than sufficient to pay expenses. The production in October was about 2300 barrels a day. If to the value of the oil, at current prices, be added the amount expended for wages, hauling and other expenses, the oil industry of the Los Angeles field represents at the present time a business of \$110,000 a month, or \$1,250,000 a year.

—The Belgian consul at Shanghai points out that the indispensable intermediary (or, as he is called in England, a "middleman") between the European and Chinese traders, is the "compradore," whose name is derived from the Spanish *comprador*—i. e., buyer. The earliest foreigners who came to settle in China for purposes of trade carried on business on the principle of exchange only, receiving merchandise in return for that which they brought with them, and the interior of China being closed to foreigners, they were obliged to have recourse to intermediaries to procure what they required. Though close competition has been created among these newcomers—all workers—a keen, constant struggle, in which the old wealthy firms have succumbed. The role of "compradore" has thus been modified; he continues, as before, to hold all the business in his hands, both in buying and selling markets; but to these professions he has added an important one—that of money lender. It may be asked why this costly and ruinous middleman is not suppressed, and it may be answered, because it is impossible, and because a firm that had no "compradore" would do no business. These middlemen have been incorporated for a long time; their corporation is the richest and most important in China, and any person wishing to do business with a foreign firm must deal first with the "compradores." If a trader tries to trade direct, he is annoyed in so many ways that he hastens to return to what are called "old customs"; and China, it should be remembered, is an essentially conservative country, where an established custom has the force of law.

Commercial Paragraphs.

The General Electric Company has established a sales office in the Templeton Building, Salt Lake City, Utah. It is in charge of Mr. H. E. Chubbuck.

The Jeffrey Manufacturing Company of Columbus, Ohio, have recently taken up the manufacture of the Columbian separator screen and bolter, and advise us that they have erected an experimental machine at their works for the testing of such material as may be sent them for that purpose. Parties interested in the screening or separating of cement, cement clinker, ores, phosphate rock, marble, fertilizer materials, bone ash, plaster paris, sand, coal, earth, clay, etc., can secure further data and prices by addressing the manufacturers.

The Pelton Water Wheel Company report recent shipments as follows: One 15-foot compressor wheel for the Gaston Ridge Mining Co., Nevada Co.; one 9-foot pump wheel for the Empire mine, Grass Valley, Cal.; three wheels for the Peyton mine, Calaveras Co.; four wheels for the Republic mine, Washington; one wheel plant for the South Bend Electric Co., Washington; seven wheels for various mines in British Columbia; four wheels for mines in Mexico; five wheels for India and Strait Settlements; three wheels for the Lyndhurst Gold Fields, Ltd., Australia.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOVEMBER 15, 1898.

- 614,364—VEHICLE CANOPY—A. S. Burnham, Wildomar, Cal.
- 614,361—FUEL COMPRESSOR—E. S. Cobb, S. F.
- 614,368—VENTILATOR—G. F. Cramer, Portland, Ore.
- 614,422—EYEGLASS FRAME—C. C. Davis, Los Angeles, Cal.
- 614,296—OIL BURNER—E. W. Dunn, San Jose, Cal.
- 614,375—ROCKING HORSE—R. Eberhard, Los Angeles, Cal.
- 614,167—FRUIT PICKING SHEARS—J. Gardella, Oroville, Cal.
- 614,103—COIN CONTROLLED APPARATUS—Hammond & Weegmann, S. F.
- 614,252—SHEET METAL CUTTER—L. Mayhew, New Whatum, Wash.
- 614,211—SLIDABLE HINGED WINDOW—Wm. McCall, S. F.
- 614,262—SLIDABLE HINGED WINDOW—Wm. McCall, S. F.
- 614,178—RAISIN SEEDER—W. M. McConaughay, Fresno, Cal.
- 614,341—DARK LANTERN—R. M. G. Phillips, Los Angeles, Cal.
- 614,144—ROOF FRAMING TOOL—G. C. Thompson, S. F.
- 614,193—THILL COUPLING—M. C. White, Los Angeles, Cal.
- 614,194—OIL BURNER—D. G. Wilgus, Los Angeles, Cal.
- 614,156—WRENCH—J. F. Woodford, Browns Valley, Cal.
- 29,685—DESIGN, GUITAR BODY—J. Hagberg, Tacoma, Wash.
- 29,683—DESIGN, RAILWAY TIE—A. J. West, Aberdeen, Wash.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special notice:

OIL BURNER.—E. W. Dunn, San Jose, Cal. No. 614,296. Dated Nov. 15, 1898. This invention relates to improvements in apparatus for burning oil and is especially designed for the burning of petroleum or equivalent oils in connection with stoves and heating apparatus of that class. It consists essentially of a perforated burner plate having an undulating surface and surrounding rim, the perforations being made so as to discharge through the highest points of the surface which are conical in shape, and through these openings air and steam and oil are delivered. Below the burner plate is a chamber with a perforated distributing pipe. A combustion chamber is situated above the burner plate, with means through which the products of combustion are allowed to escape. By reason of the conical elevation on the burner plate the oil flows downward from over the cones by gravitation and is distributed over the plate, and the mixture of air, steam and oil is thus made which produces a very satisfactory combustion. Various valves and dampers control the flame and heat at will.

SLIDABLE HINGED WINDOW.—Wm. McCall, San Francisco, Cal. Assigned to the McCall Sliding Hinge Window Co. of same place. No. 614,211-212. Dated Nov. 15, 1898. This invention relates to improvements in windows and is especially applicable to the hinging of the sashes to slidable strips upon which they are carried, the strips being vertically movable in grooves or channels between the stops and parting strips. The cords or counter-balance weights are connected with these strips, and means are provided for locking the strips to the sashes or disengaging them therefrom and locking them to the casing so that when the sash is disengaged from its moving side so as to turn about the hinges upon the opposite side, the strips will be prevented from being carried up by the counter-weight and will remain in position until the sash has again closed and interlocked with the strip when the weight of the sash will be equally divided between the two strips and the counterweight.

Recently Declared Mining Dividends.

- Mammoth, Utah, \$20,000; Nov. 25.
- Gold Coin, Colorado, \$10,000; Nov. 35.
- Republic, Washington, \$30,000; Nov. 25.
- Victor, Colorado, 15 cents per share and 85 cents per share extra, \$100,000; payable Dec. 1.
- Deer Trail M. Co. No. 2, Washington, 1/4 cent per share, \$2500; Nov. 25.

Recent Mining Incorporations.

- Bonita G. M. Co., San Francisco; capital stock, \$100,000; subscribed, \$10; W. Angus, G. L. Bresse, G. E. Crothers, T. G. Crothers, C. S. Neal.
- East Belt G. M. Co., San Francisco; capital stock, \$250,000; subscribed, \$5; C. S. Young, E. P. Barrett, J. Moss, H. S. Allen, G. Beaudet.
- Del Monte G. M. Co., San Francisco; capital stock, \$1,000,000; subscribed, \$2500; J. Fassler, J. T. Sullivan, J. Looney, G. O. Briter, W. J. Gleason.
- Holler M. & M. Co.; capital stock, \$50,000; subscribed, \$50; J. Holler, W. Hoffschneider, J. Winterburn, E. M. Wilson, A. Hoffschneider.
- Middle Fork Con. M. Co., San Francisco; capital stock \$250,000; subscribed \$50; S. Waterhouse, E. W. Waterhouse, J. A. Marsh, H. Waterhouse, E. L. Cutting.
- Golovin Bay M. Co.; capital stock \$200,000; subscribed \$25; D. A. Macdonald, E. B. Cutler, C. F. Humphrey, C. F. Hing, S. L. Barstow.

Black Diamonds.

Black diamonds are found principally in the province of Bahia, in Brazil. They are found also in South Africa, in the Kimberley district. In Brazil, the whole of the district from the Rio Abaete above stream, to Pirapora below, is being successfully mined for the mineral known as carbonado, "bort," or the black diamond. The rivers Abaete, Borrachudo, Indaia, Somno, and many smaller streams, have produced the ore; they intersect the diamond region that extends in the direction of Bagagem, in Minas Geraes, Villa Franca, in Sao Paulo, to the Rio Tibagy, in Parana. The diamond working is pursued in the rudest and simplest form. Laborers from among the natives are employed to dive in the waters of the rivers, and fill with small scoops from the gravel of the beds the pails and buckets that are lowered down from canoes by ropes; the prizes are sometimes few and rare, as might be expected from such an uncouth system. Yet it must pay, otherwise the work would not be continued in a country where cent per cent per annum is not considered more than a fair profit. The "diamond formation" is the name given in Brazil to the various minerals that are found accompanying the genuine diamond where it exists in the beds or shores of rivers. The curious substance called "bort" by the English of this region, "boort" and "diamant concretione" by the French, that is to say, having no cleavage, and by the Brazilians "carbonado" or black diamond, was formerly valueless. In 1849, it became worth from one to two francs per carat, and now a good specimen is worth as much as some species of the real gem.

The "carbonado" is supposed to be the connecting link between carbon and the diamond; the hardness is that of the true gem, and its specific gravity ranges from 3.012 to 3.600. It is a granular amorphous mass appearing under the microscope distinctly crystalline, in fact, an aggregate of granules or lamellæ of diamond analogous to a grit of quartzose sand. In some specimens are cellular cavities like pumice, empty or full of sand, and geodes lined with small regular crystals of colorless diamond. It is black and lusterless, and when black it leaves a residue of clay and other substances. This carbonado accompanies the true diamond in sand and in cascalho; it appears in angular and rounded and irregular lumps, being often as large as a walnut. It is well known by its great weight, by its diamond-like coldness in the hand, and by its sharp peculiar sound when bits of it are scratched or rubbed together. The miners sometimes steep it in vinegar, to augment the weight, and it so resembles a piece of common magnetic or pyritic iron ore that without care the best judges are deceived. The "bort" or "carbonado," however, has no attractive power. It is tried by striking it between two copper coins, and if it breaks or does not dint the metal, it is held valueless. The principal use to which the black diamond is put is for diamond cutting. It is pounded and ground to a powder, and used for diamond cutting and diamond drills.

It is stated that the diamantine formations in these regions in Brazil have as yet been but merely scratched, and the works of the laborers have been compared with those of beavers. The rivers have not been turned from their course, and the deep pools above and below the rapids, where the great deposits must collect, have not yet been explored, even with the diving helmet. It is said that the next generation will work with thousands of arms, directed by men whose experience in mechanics and hydraulics will enable them to economize labor. Carbonado is found also in the bank formations of the rivers. Privileges or grants of portions of streams may be obtained from owners, or from the Government, for diamond washing, for reasonable sums of gold. There are rigid laws in Brazil against washing the streams without these grants, though, in spite of the restrictions,

much valuable mineral is taken out of streams and sand hills in unfrequented regions without the preliminary obtaining of a grant.

Gray's Cage Chairs.

These chairs, which have been placed in the Hope, Leiter and other mines, are adapted either for vertical or inclined shafts. The illustration shows

GRAY'S CAGE CHAIRS.

them as used for an inclined shaft. The improvement over ordinary usage consists in having one set of chairs attached to the cage, instead of a set of chairs for each shaft level. The chairs are thrown out by means of a lever, so as to rest upon wall plates at the several levels, and when the lever is out of operation springs draw in the cages so as to clear the wall plates. These chairs are not only economical, substituting one set of mechanism for many, but furnish the convenience and security of operation from the cage.

They are the patented invention of Alex Gray, Butte, Montana, and are manufactured and sold by Fraser & Chalmers, Chicago, Illinois.

Softening Water for Steam Boilers.

F. G. Ansell gives his experience in softening hard water for his boilers as follows:

I had a small plant put in for my present boilers about ten years ago, capable of softening 2000 gallons an hour; it can be started and stopped instantaneously, is very little trouble, and gives most excellent results. In fact, it has saved fuel enough to pay for itself many times over, and by using it I can be quite sure of keeping the inside of the boiler free from "scale." The apparatus is very simple. I have part of an old boiler, with the furnace removed, stood on end. It is 18 feet high and 8 feet in diameter. In the middle of it is a vertical tube, about 10 inches diameter, going to within about 15 inches of the bottom. The hard water is led by a pipe to the top of this 10-inch tube, and so is a smaller pipe conveying lime water, and the two streams mix as they fall to the bottom of the 10-inch tube, and when at the bottom the water spreads out across the 8-foot cylindrical tank, and so rises gradually to the exit tubes, whence it flows into the heating tank, where it is heated by exhaust steam from the engines. The

lime water is made by putting quicklime into some water and stirring, by which it is made to appear somewhat like milk, and the quantity required is regulated according to the natural hardness of the water to be softened.

This is, of course, determined by the analyst. I have many times analyzed the water before and after softening by this process, and find that the total amount of lime is reduced from 10 grains per gallon to 1.4, the carbonate of lime from 15 grains per gallon to nothing, the total quantity of magnesia from 2.05 grains to 0.5 grain per gallon, and the total solids from 30 to 10 grains per gallon before it reaches the heating apparatus. This result I consider very satisfactory, and I find that the boilers can be kept quite clean if the stoker will blow off frequently enough to prevent the water in the boiler from becoming too concentrated. Of course, if this is neglected, any sulphate of lime naturally in the water will be deposited on the inside of the boiler, and so will a small percentage of magnesia.

If the above-mentioned details are properly attended to, then there is absolutely no chipping off of scale to do; but a slight difficulty may arise with regard to the frequency of blowing off in the case of waters containing sulphate of lime. However, there are two ways of obviating this, viz: Put a little carbonate of soda into the heating apparatus, or (in fact, I might say in some cases, and also put) the day before it is proposed to draw the fires and stop the boiler, about 1 cwt. of the soda crystals to dissolve in some of the feed water, and pump it into the boiler a little at a time. The solution should be allowed to stay in the boiling water of the boiler up to its working level for about twenty-four hours, where it will attack any scale it may find there, and make its removal quite easy. It is advisable to add this solution of soda a little at a time, in case the stoker should not be quite certain as to the state of the water in the boiler, because if it should be loaded with mineral matter, then the addition of soda in any but small quantity would most likely cause "priming." The great advantage of this process is that it adds nothing to the mineral matter dissolved in the water; but, on the contrary, actually removes a good amount, as all those who use the process know. The removal is effected by opening a valve in the bottom of the

and, of course, it is also a little extra expense. All feed water should be let into the boiler close to the level of the surface, and it is a good plan to make a series of small jets, so that the surface may be well disturbed, and so break up any scum which may have accumulated upon it; but I do not think there is any fear of scum if the water is properly softened and cleaned before it enters the boiler. Hot feed water may easily be pumped into a boiler, just as cold may, provided the hot water is delivered to the pump a foot or two above the receiving valves; but, of course, owing to the extreme tension of the vapor of hot water, no suction is possible. If the feed water can be heated by any waste heat, so much the better, as, of course, it means a saving of fuel. A second means should always be provided for getting the feed water in—e. g., two donkey pumps, or a donkey pump and also an injector. Injectors can be had to work with the feed water up to a considerable heat, and donkey pumps will throw water very nearly or quite boiling.

"Link-Belt" Steam Weigh Box and Shaking Screens.

The accompanying cut is a partial view of the steel tippie building at the No. 1 shaft of the Spring Valley Coal Co., Spring Valley, Ill., and shows what is probably the most perfect arrangement at present in use for weighing and screening bituminous coal at a mine. It consists of a steam-operated weigh box and a pair of shaking screens. The shaking screens are arranged to make four different sizes of coal, delivering them either severally or in various combinations to cars on the four tracks shown. As the lump coal at this mine is very largely loaded into box cars on the outer track, a special apron has been fitted to the end of the screen in such a way that it can be quickly and easily removed from or entered into a box car, or adjusted to load an open car. To do this only requires as long as is required in the case of a box car to enter the reciprocating box car loader used at this place, or, in the case of the open car, to bring the car into position under the apron. The entire apparatus has a capacity for weighing and screening four pit cars per minute, and was invented, built and erected in run-

STEEL TIPPLE BUILDING AT NO. 1 SHAFT OF SPRING VALLEY COAL CO. Showing "Link-Belt" Steam Weigh Box and "Link-Belt" Shaking Screens; Capacity, 2000 Tons in Eight Hours.

18x8 feet cylindrical tank mentioned above, which is made of such a size that the mixture of water to be softened and lime water when spread over its bottom will rise more slowly than the sediment falls, and so the feed water for the boiler is run off the top quite clear. The sediment should be run out about once a week, and does not take many minutes. I much prefer not to add soda if it can be avoided, because it is impossible to remove it from the water when it is once put in,

ning order by the Link Belt Machinery Co. of Chicago.

A visit to this mine is well worth the time of any coal operator, as the entire equipment, including screening and loading arrangements, the steel tippie buildings, hoisting engines, Cappell fans, shaft bottom and in fact everything about the place, is of the very best that can be obtained, and, as stated before, constitutes what, as a whole, is probably the most complete thing of its kind in the bituminous field.

Mining Summary.

ARIZONA.

The Buena Vista mines at the Senator camp will resume operations this month.

J. T. Douglie of Prescott has bought the Mormon Elder mine and a half interest in the Turnbaugh. The Mormon Elder was bonded by Douglie last May for \$10,000 and the Turnbaugh for \$20,000. He has run 1200 feet of tunnel and has stripped and faced the lodes in different places on the Sultan 7000 feet and on the Wyandotte 300 feet.

Enterprise: In the Placitas country three mills have recently begun milling ores.

Star: The Arizona school of mines at Tucson has received through Prof. Blake thirty tons of crude wolframite ore from the Dragoon mountains for concentration, preparatory to shipment to Philadelphia. Several shipments of a few tons of hand-sorted ore have already been made, but the bulk of the production requires crushing and concentration to free it of the quartz gangue.

Arizona: D. Brown has bonded three mines in the Graham for one year at \$100,000 to the Spenezuma Co.

Globe: Burns & Co. are taking out copper ore from one of their claims near Globe. They have arranged with the Buffalo smelter for all the ore which averages 45 per cent.

Oasis: In the Altar district work has resumed on the San Manuel mine, the property of J. B. Hagglin. It is developed to a depth of 200 feet, showing low grade ore in large quantities. It is said to be the intention to devote a year to developments, and should they justify it a 50-stamp mill will be erected.

Yuma Sentinel: Senator Dorsey has a force of men at work on the Del Monte group of mines near Harrisburg, preparing to erect a 40-stamp mill. The mill is designed to handle a particular class of ore. Mr. Dorsey is progressing with his Placacho property, and when the Del Monte mill is started he will turn his attention to the California side of the river.

—L. C. Moreland, who discovered the Bay Horse gold mine in Mesquite district, has begun work on the Cash Entry mine in the same district.

Prescott Courier: The Swindler mine in Yavapai county, which was a gold mine, is turning out to be a copper property. Three eight-hour shifts are at work. A carload of concentrates from the Crowned King were shipped from Mayer last week.

Phoenix Republican: In the northern part of Maricopa county are a number of small mining camps which are becoming of importance. Occasionally one is given life by eastern capital. Some of these camps are over the line in Yavapai county, and the King Solomon group is one. A year ago this camp was enjoying a Rip Van Winkle sleep, but today there is a demand there for miners and the camp is forging ahead. Among those doing development work are Gilbert & Rowe, who are sinking a 75-foot shaft and another 100 feet on the Hamlin group for Colorado capitalists. On the McIntosh group a Colorado company is sinking a shaft. The above two groups are copper and gold with a little silver. M. Gamage is well under way on his long tunnel.

Mohave County Miner: In running the tunnel on the Green Lennet mine, a small vein of good ore was cut.

Graham Guardian: Qualey Bros. shipped two carloads of high grade ore from the Lone Star district. The London Exploration Co., will erect machinery at the Ray mine near Red Rock.

Tucson Star: The Canon del Oro gold mines in development are holding out well in the ore.

Yuma Sun: The Daisy Dolores near Tyson's Wells is being developed and a large body of ore has been found. The lowest assays are \$10. Much of the ore will bear shipping. C. Davies on the Union mine near Phoenix has fifteen men employed.

CALIFORNIA.

Amador.

Jackson Republican: The Argonaut mine has paid in dividends up to October 26th \$180,000, and has money in the treasury. Work continues as usual and there is no lack of water yet. Sinking continues at the Zeila mine. At the Anita the regular force is engaged in sinking. At the Onaida mine a large mill will be built by the Onaida Co. The Kennedy is using steam for hoisting and if the dry weather continues will be obliged to run the mill by steam. Everything appears encouraging at the Lincoln mine, Sutter Creek. Water is giving trouble at the Amelia mine, but work is going ahead rapidly. Good rock is coming out of the Valparaiso mine near Jackson. Preparations are making at the South Spring Hill mine, Amador City, to renew operations in a short time.

Jackson Dispatch: The Union Con. G. M. Co. has applied to be declared insolvent. The mining property of the corporation comprises the Wieland, Alma, and Jackson Gate mines near Jackson. The company has no title to the property, but has been working under a lease. It possesses some personal property, the value of which will not exceed a few hundred dollars. The liabilities amount to upward of \$25,000 and are distributed among many creditors.

Sutter Creek Record: J. H. Grady, E. B. De Golia and J. D. Richardson of Oakland were at Sutter Creek last week to look into the affairs of the Central Eureka mine and consult with Supt. Thomas. The affairs of the Central Eureka are being straightened out and everything will soon be running again. The new directors are determined to conduct the affairs on a business basis.

Butte.

At Forbestown 120 men are employed in the Goldbank mill and mine.

At the Banner mine, near Oroville, the 2000 feet of pipe line from the bulkhead to the

mine is completed. The pressure will give a strong force for electric purposes. This pipe was riveted by air pressure.

Oroville Mercury: W. Strang brought to Oroville a gold brick valued at \$750, the result of forty-five tons of rock from his ledge at Hengy. In Granite Basin work is progressing in the mines of the district and ore bins are full awaiting water to begin crushing. See & Jolly are taking out ore at their mine and four men are at work at the Hall mine preparing to start the mill, and F. Early is crushing ore for F. W. Benjamin. Sharp & Quimby at Yankee Hill will soon begin washing their gravel stored during the summer.

Oroville Register: Fifty men are working on the tunnel to convey the waters of Cherokee ditch to the Banner mine. Power drills are in use. Rutherford & Stevenson sold a quartz claim near Wyandotte, and the new owners will at once begin work on the property.

Oroville Register: The dredger on the Gray place near Oroville is almost completed. There are twenty-five Chinamen at work in the river mine near Big Bend. They have had a favorable summer and fall for working.

A. B. Chambers & Co. near Merrimac are building a 5-stamp prospect mill. If the ore pays as well as they think they will build a large mill. On the Little Hope mine near Oroville the company after prospecting the ledge is building a 10-stamp mill which will be running Jan. 1.

Calaveras.

San Andreas Citizen: Work has begun on the stamp mill of the Ford mine near San Andreas. The Lively mill will soon be in operation again. Work is progressing on the California Exploration Co.'s mine, the Thorpe, at Fourth Crossing. The Yellow Aster gold mine near West Point is being developed by the new owners, Morgan & Co. They propose building a mill. At the Paragon mine last week a vein $4\frac{1}{2}$ feet wide was encountered in the 400-foot tunnel. The Empire mill is grinding rock from the Machu mine.

Jackson Ledger: The 40-stamp mill at the Gwin mine is to be enlarged. Forty stamps are to be added.

El Dorado.

(Special Correspondence).—The Crown Point M. Co. near Diamond Springs have reached 375 feet in their shaft and 400 feet in tunnel. The shaft is in ore at the 350 level, where a 4-foot body of high grade galena was cut. The company is running a drift on this ledge. They are operating the hoist by steam and employ eighteen men.

The Marguerite, in the same mining district, is being developed by a company of Indiana capitalists. Their work is thorough. Last week they struck an ore body in the shaft, and are taking out a good grade of ore.

At the Larkin on the 400 level a 12-foot ore body has been cut that is of high grade value. On the Griffith the Juniper M. Co. are nearly ready to start their new 20-stamp mill, which will be run by electricity. There is a large quantity of ore on the dump that is of good value.

The Ribbon Rock mine in the same neighborhood is being developed by a Salt Lake City company. They are driving two tunnels, in one of which an ore body of 12 feet width has been crossed. The two tunnels will aggregate over 200 feet. At the Selby mine a company has begun to unwater the property. All the properties heretofore mentioned are squarely on the mother lode.

The Gold Bug mine, also on the mother lode, in Placerville, is sinking a shaft; they have struck rich ore in the old tunnel through which the mine had been operated. The company has secured additional ground for dumping facilities and are about to put in a steam hoist.

The Atlantic mine has recently been acquired by a company who have resumed work on the property, which had been abandoned for many years, and the indications in the new work are of an encouraging nature.

The Gopher Boulder at Kelsey is preparing to resume work and start its 40-stamp mill.

The Church M. Co. near El Dorado has again resumed operations and is running its 10-stamp mill on a small vein of rich ore.

On the Hill Ranch mine sinking will be resumed shortly. They have been crushing a fair grade of ore.

The successful operation of the foregoing mines is doing much to bring into prominence the favorable opportunities of the old Empire county, which has long waited for capital to prove its value as a mining section on the mother lode.

At the Clark mine near Placerville a good grade of cement gravel is being crushed in a 10-stamp mill. There are 108 acres in this property.

Placerville, Nov. 21st, '98.

Inyo.

Independence Independent: P. Reddy of San Francisco has bought the N. S. Thompson mine at Darwin for \$5000. The property is between the Defiance and Independence mines, both of which belong to Mr. Reddy. The central property has a long tunnel through which all the ground can be worked, and it will make low-grade ores profitable.

Kern.

The Comet mine, on the Greenhorn, has been sold by W. W. Stockton to San Francisco people for \$3000 cash. The new proprietors will erect a mill and push the work of extracting ore.

A strike is reported in the Talc mine near Woody of a body of high grade ore. The mining industry is thriving in the Smith district. The Big Horn Co. is putting in a 2-stamp mill to be run by water power and it will soon do its own work in addition to custom milling. The camp has good prospects of being a steady gold producer. There are about twenty-five men in the camp.

Randsburg Miner: The Trilby tunnel at Randsburg is encountering new ledges. The

last strike is 530 feet from the entrance. About \$10,000 was quarried from the surface of this property. This new ledge is 3 feet wide; it ran \$50 per ton on top; 800 feet below it mills from \$150 to \$200 per ton. Forty feet of ore is exposed and the walls are not found. The whole will mill \$30 per ton. The pump is in place at the Yellow Aster Water Works, and tests will be made as soon as the 100,000-gallon tanks can be riveted together at the mill. The pipe line is all covered, and a week will see water flowing down Rand mountain.

The Red Dog mill at Johannesburg is running ten stamps on ore from the Butte mine.

Lake.

Calistogan: The Sulphur Bank quicksilver mine near Lower Lake started up last week with a full crew. It has been shut down over a year. The property is owned by the Sulphur Banks Q. S. M. Co., 306 California St., San Francisco.

Nevada.

(Special Correspondence).—The Brunswick M. Co., which some time ago introduced electric power to run the mill, when obliged to stop its pumps because of water failure for power, last week put in electricity to operate the pumps. The change was made in less than four days, and, in consequence, work continues at the mine in all departments.

Grass Valley, Nov. 22nd, '98.

The South Yuba Water Co. bought 640 acres of land last week covering the upper end of Summit valley for reservoir sites, on which the company will build a reservoir to hold upwards of 200,000 inches of water, which, with other contemplated improvements, will increase their total storage capacity to over 1,000,000 miners' inches of water. By this improvement the people of Nevada county will be insured against any more water famines.

Grass Valley Union: The contest for possession of the Reddick gravel mine near Nevada City is on trial in the Superior Court. Should the plaintiffs win the case, the company will either have to pay them \$10,000 or abandon their claim, which at present is paying well. The mine is working forty-six men, but will soon suspend operations unless rains bring a water supply.

Nevada City Transcript: The new 20-stamp mill at the Con. St. Gothard mine near Columbia, is running smoothly this week. The mine has a large amount of ore on the dump. S. Smith of San Francisco is sinking a shaft on the Bismarck & Gladstone, near Nevada City.

Grass Valley Tidings: The miners at the Empire will remain unemployed until the rains send sufficient water to run the mill. A steam plant was put in operation for hoisting, but as the mill cannot be operated no rock will be hoisted.

Nevada City Herald: Developing operations have been in progress at the La Suerte mine for several months and the mill will start as soon as water can be obtained.

Grass Valley Union: W. L. Wallace is erecting a 2-stamp mill on the Bulldozer mine near Graniteville and expects to have it running next week.

Placer.

The tunnel of the Blue Canyon M. Co. near Shady Run is in 1150 feet.

Auburn Herald: At the Gold Blossom mine at Auburn sinking and drifting continues. The Hathaway is still running, but must close down soon if the dry season continues. C. A. Reed is putting up a 5-stamp mill and will start up as soon as he can get water.

Colfax Sentinel: A strike has recently been made by the Gold Run Gravel Co., Limited, near Gold Run. The old tunnel at the lower end of the mine has been extended 600 feet and struck a body of gravel said to be rich. The drift in the new ground has been extended up the channel 300 feet. The width of the channel is 150 feet, and the gravel is 5 feet deep. When water can be had for power the 10-stamp mill will run steadily to crush the gravel. Ten men are employed. Col. J. E. Doolittle is superintendent. The holdings of the company comprise 12,000 feet of channel, which is tapped at the lower end.

Riverside.

It is locally reported that the tailings from the Santa Rosa mine, near Percis, are giving returns of \$1500 a month. The stamp mill at the Eureka mine, owned by Thomas & Wheeler, has begun crushing ore. F. Hibble has discovered quartz near Winchester. Shultz & Knapp have struck gold and silver bearing ore near San Jacinto.

San Bernardino.

The Index M. Co. will develop the Iron Mask, One Horn and Index mines near San Bernardino.

San Diego.

The Helvetia mine near Ramona has a large force at work. The pumps are working day and night.

Shasta.

Redding Free Press: The New Brunswick mine near French Gulch found high grade ore in the lower tunnel, but were compelled to stop work for lack of air, which will be remedied soon. Wright Bros. have leased five claims owned by Fitzpatrick & Co., known as the Safe Deposit group, on Flat creek, and have begun work. In the Milkmaid mine, near French Gulch, work will not be resumed until spring. J. H. Roberts of Harrison Gulch is sinking a shaft on the White Oak mine near Salt creek. Sixty flasks of quicksilver from the Altona mine at Cinnabar were shipped via Redding last week.

Redding Free Press: The transfer to Eastern capitalists of a large copper property near Redding is all but effected. Development has been going on for some time, and it is understood that the result is favorable. When the transfer is made a smelter will be built. Shasta's copper belt is being exploited at six different points. Favorable tests have been made in the Stillwater district that will probably result in bringing into the county a Ger-

man company which will operate on a scale not inferior to that of the Mountain Copper Co. Shasta Courier: Mining developments continue from Shurtleff Hill in Shasta to the Mt. Shasta mine on Clear creek, and to Paige's on Boulder creek, with more men employed than has been the case in the history of the county.

Sierra.

Downieville Enterprise: York & Sons have made another strike in their mine near Downieville. There are ten carloads of high grade ore ready to crush and about 100 tons in all ready for the mill, awaiting water. Five carloads of provisions and machinery arrived at the Gold Bluff mine last week.

Quincy Independent: The La Porte Gravel M. Co. near La Porte has finished a dam 40 feet wide and 200 feet long to restrain tailings. S. Chapman of Chicago is Pres. of this company, which is making preparation to begin work at the coming of water.

Slackton.

McCaw & Co. are getting their quartz mill in place near Fort Jones, to begin crushing as soon as possible. They have a ledge 30 feet wide.

Yreka Journal: McCaw & Co. of the Patterson creek quartz mine, near Fort Jones, have a large ledge that is said to yield \$35 per ton. The company received two carloads of machinery last week; the mortar beds weigh 6800 pounds. The Greenhorn blue gravel mine is paying and worked day and night. The water is pumped from the shafts and drifts to keep the sluices supplied. The Pacific mine, Klamath river, has ceased for the winter. The McConnell & Quine mine has been paying fairly well and will be worked until the storms compel it to cease.

Yreka Journal: The managers of the Pacific mine, Klamath river, continue testing the ground near bedrock. The other claims along the river will be worked until the storms drive the men out. A. Frazier, opening up the old Golden Eagle mine, Scott Valley, has sunk a shaft 120 feet deep. The prospects are encouraging.

Trinity.

Redding Free Press: A. Van Ness, at Doeblinville, is running his arrastra day and night. Alverson & Brown at Crooked Bend are taking out gold on the Woods gravel claim. A New York company, represented by S. H. Rice, has bought 16,000 acres in the Horseshoe Bend of Eel river, in the southwest portion of the county, for \$350,000. The first installment was made on the 15th inst. A deposit of copper-bearing ore, 1200 feet long by 70 feet wide, has been discovered on the property. Tests of the ore have returned values ranging from 9 to 18 per cent copper, \$5 to \$10 per ton gold and \$3 to \$10 silver. Opening up the body of copper ore will begin immediately and a considerable force put to work.

Weaverville Journal: The company having an option of purchase on the Mountain Boomer mine at New River are driving their work. They have found the ledge in the upper tunnel and indications are good in the lower tunnel. At Poker Bar the construction of the Postlethwaite dredger, costing upwards of \$40,000, has been in successful operation. It requires but two men to look after every detail of its work, and the amount of deposit it handles in a day is large. Four miles of the stream are controlled. As a result of this company's venture the possibilities of Trinity river on this score have attracted attention and two other companies, it is said, are investigating along these lines.

Tulahoma.

(Special Correspondence).—At the property of the Jubilee M. Co. a discovery has been made of a vein 30 inches wide carrying lead and arsenical sulphurets, mixed with black carbonate of iron. Assays run from \$1200 to \$2000 per ton. Free gold is interspersed all through the quartz, yielding \$300 to \$500 per ton. The vein is in diorite-schistose and quartzite. This property contains five claims. One is a 400-foot, low-level crosscut tunnel. It is known as the old Hazel Dell.

Sonora, Nov. 21st, '98.

Jamestown Magnet: At the Densmore mine, near Columbia, fifty-three men are employed. Fischer & Co., operating the property, are putting up two 2-stamp mills. Anderson & Co. are running a tunnel on the Royal claim. Van der Werdt & Co. are running a tunnel on their property. In the Hope mine, Conlin & Ferguson have struck the vein. The force at the Dutch mine at Quartz is being increased again. They are drifting on the ninth level in the ore body. The shaft is down 900 feet. The Dutch Co. will soon be using coal exclusively for fuel. On the Booker ranch, near Sonora, Dean & Stevenson, who have the property bonded, are sinking a shaft. On the Dunton ranch they are taking out high-grade ore. The Alameda mine, near Jamestown, is operated by Chicago men. Three years have been spent in development, operating with compressors and power drills. A depth of 950 feet has been reached, six levels opened and over 2000 feet of drifts, crosscuts and tunnels run. Dams were constructed below the mill; and while the water from the Norwegian mine while repairing its pipe line was running, over half a million gallons were impounded. The first dam catches the tailings and the second impounds the water, which is raised vertically 207 feet through a pipe line 650 feet long by a steam pump. The mine furnishes sufficient water to replace that lost through evaporation and seepage and keeps the amount impounded up to the original stock of 500,000 gallons.

Yuba.

Marysville Appeal: A force is at work in the Boa quartz mine, near Timbuctoo, sinking the shaft that was abandoned because of water. Fair quality of quartz is found.

COLORADO.

CLEAR CREEK COUNTY.

At Georgetown, in the Corry City mine, a

mill run of seven tons of ore gave returns of 391 ounces in silver to the ton.—At Idaho Springs, J. Owen, who has been operating the Gum Tree mine for three years, received \$57,000 in cash for that property, which includes four claims. New York people were the purchasers in the name of the Gum Tree G. M. & M. Co.

At the American Sisters mine, at Idaho Springs, shipments made by leasers amount to two or three carloads, and run about 150 ozs. silver and \$5 or \$6 gold per ton.

EAGLE COUNTY.

The total tonnage of ore shipments from the Battle Mountain district, near Red Cliff, since January is 10,850.

EL PASO COUNTY.

The Minnie Bell at Victor has taken \$10,000 from the shoot recently encountered.

The Raven Co.'s properties at Victor are producing 150 tons weekly; the ore is all shipped; it carries from 1½ to 4 ounces gold per ton.

Sinking has been resumed to the 600-foot level on the Gold Coin, Cripple Creek. The ore is of better grade than September and the output for October will exceed that of the previous month.—The Zenobia shipped the end of October twelve tons of \$300 ore and fifteen tons of \$50 ore.—The Horner-Black lease on the Clara D. claim of the Lexington G. M. Co. at Victor, shipped in October \$6000 worth of ore, taken out in development work. On this the company receives 25 per cent royalty.—The Portland mine, employing 225 men and operating nineteen drills, is putting in a new compressor and increasing the drilling capacity to forty-five drills.

Victor Record: A one-fourth interest in the Boyd lease on the Morning Glory, near Victor, was sold for \$2500. The workings are shipping steadily.—The lessees of the Ironclad are furnishing Brodie Reduction Works 700 tons of ore monthly. The ore will go about one ounce to the ton.

FREMONT COUNTY.

A good strike is reported from the Clyde mine, near Wilbur. Assays run from \$10 to \$200 per ton. The mine is developed by a 300-foot tunnel at a depth of 160 feet.

GILPIN COUNTY.

At Central City, last week's pay day at the mines the sum disbursed was nearly \$150,000, representing a month's pay.

LAKE COUNTY.

The output of Leadville for October foots up 56,000 tons of ore of all grades.

Leadville Miner: The Hooker pump in the Bohn shaft at Leadville is throwing water. This makes five pumps working, making a total of 3,600,000 gallons running down the sluiceways every twenty-four hours from the basin mines.—The Iron Silver M. Co. have expended upwards of \$20,000 in unwatering the Moyer workings. At present the water is below the third level. Shipments are about fifty tons daily from this shaft, which will be increased. So far 1500 tons of clean iron sulphides have been sold to the Colorado smelter since the water has been taken out.—The Katy ore chute, which has been discovered at the 550-foot level of the Dollie B., shows up good. Plenty of exploration work is kept ahead. This work is done with air drills. The operators lost \$40,000 by being twice drowned out, and, taking advantage of past experience, are prepared to handle any flow they may encounter. Much of this ore deposit is of good grade, while plenty of mill material is showing up. Shipments run sixty tons daily.

Leadville Miner: The Moline M. & D. Co., owners of the William Wallace mine, are shipping fifty tons of oxide iron ore daily to the smelters. This property has a shaft 900 feet deep.

Leadville Miner: There never was such a demand for ore teams as in the past forty days. The ore bins on all the heavy shippers have been full constantly. The demand for more teams arises from the increased output from five old shippers and five new producers, the Fanny Rawlings, Moyer, Louisville and A. Y. and Minnie. There are thirty-six four-horse teams hauling from the Ibbex alone, making fifty-four loads of ore daily from this producer.

Leadville Reporter: Near Leadville, in the Sugar Loaf district, the Gunnison mine is shipping thirty-five tons a day of good grade ore.

Leadville Miner: The Twin Lakes Placer Co., which owns 4000 acres of placer ground in this county, has closed operations for this season. A vast amount of prospecting has been done in the last year, which has demonstrated that the gravel will average 58 cents per cubic yard. Large revolving cranes operated by water power are used to handle the boulders, and the gravel is knocked down by giants, four of which have been put in for next season. From a clean-up on some prospect work \$2600 was obtained. This property has been idle for many years, but a consolidation of the various interests has made it practicable to work it in a systematic manner.—The Yak tunnel will drain and develop land on Breese hill to a depth of 800 to 1200 feet.

—The Ibbex output is above 300 tons daily of iron sulphides and silicious gold quartz. The pay-roll carries 500 names.—F. F. Harrington, Mgr. Black Iron mine near Leadville, is shipping 10,000 tons of iron ore. Eight cars was the output last week.—The Sunnyside mine is making a five-ton shipment to the Parker stamp mill at Granite. In case this run is satisfactory, they will put in a stamp and concentrating mill.—The Gunnison mine is shipping twenty tons daily of high-grade silver ore.

MINERAL COUNTY.

Creede Candle: The output of the Commodore mine at Creede is limited to the number of cars the D. & R. G. can furnish it, and the ore blocked out will insure the present output for five years. Under this company's management deep mining will be demonstrated in

this section.—The Creede Co-operative Leasing Co. are running their mill day and night and shipping high grade concentrates.

PARK COUNTY.

The Hock Hocking mine at Alma is shipping a carload of ore a day, and the Orphan Boy is shipping twenty cars a month.

SAN JUAN COUNTY.

The Gold King mine mine at Silverton, is shipping three carloads of concentrates daily.

At Silverton the Gold King is shipping three carloads of concentrates daily.—The Florence is in a large body of pay ore.—At the Excelsior, comprising eleven claims, Butler & Carver opened a body of galena, about 4 feet wide, returning 60 per cent in lead.

SAN MIGUEL COUNTY.

From Ophir ten to twenty cars of crude ore and concentrates are shipped every week. This is mostly a silver product.

The Trout mill is turning out a good product from the Silver Chief mine and has a full supply of ore for the winter.

Extensive development work is progressing on the Keystone placer claim, near Telluride. Two pumps, with a reputed capacity of 1400 and 2400 gallons a minute, respectively, have been installed in a plant being sunk to bedrock of San Miguel river. The gravel is said to average 50 cents a yard in sinking.

Telluride Examiner: Development is progressing in the Shoemaker mine at Ophir. During the season an average of ten tons of ore per day has been shipped and the values have maintained good figures.—Suffolk leasers are sending down fair products from the different properties in control of the Suffolk Co. The ore plates from \$15 to \$100 per ton.

At Telluride the Euclid Avenue mine has been sold to Denver and San Francisco people for \$75,000. The company has been incorporated as the Euclid Avenue G. M. Co., and preparation is being made to push work on the property without delay. A bucket tramway 2000 feet long will connect the mine with the mill.—At the Silver Pick mine 165 men are employed.

IDAHO.

Near Mount Idaho a strike has been made. It is claimed the ledge is 90 feet wide and is as rich as the Buffalo Hump. Only meager details are known, but it is said there has been a great stampede from Florence to the new discovery.

At Sunset, W. A. Clark will run a tunnel 2500 feet in length, in which distance it should cut between eight and twelve ledges.

At Kendrick, the Mascot M. & M. Co. is taking in a new stamp mill. The last mill run yielded \$18 per ton.—The Democrat mine, near Kendrick, has a tunnel 900 feet; the ore averages \$6 per ton. The placing of a 10-stamp mill is contemplated. J. Dunn is Mgr.

Cleat & Co. have bonded the Alaska mine, near Pierce, and put a mill on the property. They have a 10-inch body of ore which averages 20 per ton.—The Eureka Pacific Co., operating on Beeds creek, have several hundred acres of placer ground. A test run recently gave good results.—The American Placer M. Co., on Oro Fino, has completed a big ditch and flume. The company is putting in three giants. This property is said to have prospected from 50 cents to \$2.50 per yard.

In the Seven Devils copper district they have mined many thousand tons of ore and have a 75-ton smelter. The ore carries 14 per cent copper and runs as high as 93.5 per cent. A railroad is to be built to a point on Snake river, to start from Nagel, on the Short Line, two miles west of Huntington.

Idaho City World: The Golden Fleece mine at Centerville has a ledge from 3 to 4 feet wide and all good ore.—Gerard & Co. has a ledge from 2 to 7 feet wide of good ore and a chute 800 feet long.—The California Co. has let a contract for running a 400-foot tunnel on one claim, and building a hoist on the other.—The Twin Springs has thirty men enlarging the Lambing ditch.

Hailey Times: The Atlanta G. & S. Mines, in liquidation, has transferred to the Atlanta G. & S. Con. Mines the Atlanta No. 1, No. 2, No. 3, No. 4 and No. 5 mines; also the McMahon water right and ditch, the Baxter tunnel; also the New York, Magnet and Fifth Discovery lodes; all being the property sold by the late V. S. Anderson to the first named company of London, England.

Idaho City World: Woodburn & Anderson, at Grimes' Pass, have been crushing good ore from the Bruiser and Pheasant claims. The Bruiser ledge is 7 feet wide and all pay ore. The Pheasant vein is not so large, but the ore yields well.—A. J. Maloy has a good showing in a 300-foot claim—a portion of the old Bruiser location—and is taking out ore.—From Florence a strike of high grade gold ore is reported in the belt between the Buffalo Hump and Thunder mountain. The strike was made on the Morning Star group of a vein reported to be 30 to 90 feet wide.

Lemhi Republican: The carload of ore shipped from the Copper Queen mine, near Lemhi, went \$16 per ton in gold, 5½ ounces in silver and 27 per cent copper.

MONTANA.

The output of the placer mines at Quartz City, Missoula county, after the season's work, aggregates this year \$75,000.

The Empire mine near Livingston has been bonded for \$35,000 to Butte capitalists.

Butte Intermountain: The chief interest in Butte centers in the talk about the movements of the Washoe Copper Co. and the probability that this company will soon resume work on its many properties in this district. During the past year development work was pushed on the Moonlight, its latest acquisition. The Gold Hill was also thoroughly exploited two years ago, but no work upon both the shafts of the Gold Hill has been in progress for more than a year. The belief is entertained in Butte that the company is planning to resume on a large scale next spring, by which a thousand or more men would be given employment. The outlook is

encouraging for Butte and the stability of its mines is assured for many years.—The Keystone at Sylvanite is showing up well. It is understood that a 60-stamp mill will be erected in the spring.

The Butte Intermountain says that nearly 1000 more men are employed in mining operations around Butte this year than during the preceding year, and that this increase is largely due to the development work in progress at the copper properties and the opening of new ore bodies. It is estimated that there are close to 3500 men employed about the mines of the Anaconda Co. alone. The Boston & Montana and Butte & Boston mines show a marked increase in the number of men employed in and about the mines. In all over 7000 men are employed in the district.

Missoulian: The Missoula Placer M. Co. at Quartz reports that this season's work has been successful. The clean-up was large. The pay streak, which averages 40 cents a pan, has been located; and, with the improvements to be made in the spring, a large quantity of the ground can be handled.

NEVADA.

The series of tests to which the ores of the Robust, St. Patrick and Utah mines of Ely have been put have demonstrated that they may be successfully handled by the cyanide process. The mill on the ground will be enlarged and fifty tons a day put through. An officer of the company says that the ores, of which there are large bodies, showed to date an average of \$10 gold per ton and that a profit could be made.

In the Golden Eagle mine in Humboldt county the shaft is all in ore that shows an average of \$15 gold per ton. The strike was made at a depth of 100 feet.—The Dexter mine at Tuscarora shipped a \$4000 gold brick and \$4900 in cyanides last week.—The Eira Co. will begin the sinking of a new shaft shortly.

Ohio people, known as the Cuyahoga M. Co., bought from F. C. Everett three mines in Lyon county for \$12,000. On one of the claims a tunnel has been run 125 feet, which opens up a vein 1 to 4 feet in width. The company will at once overhaul the mill, enlarge it and put in a concentrator. A cyanide plant and hoist will be erected and a shaft sunk 500 feet.

The shipments last week from the Eureka and Hamilton districts were 508,360 pounds. S. F. Godbe of the Nevada M. Co. at Pioche says that they will be able to continue work through the winter.

NEW MEXICO.

An electric light plant is being put in the Confidence mine in the Mogollon district, and the machinery will hereafter be run and the mine lighted by electricity. One hundred and fifty men are employed.

A gold brick shipped from the Bland and the product of one week's run at the Albemarle weighed 101 pounds.

OREGON.

Ashland Record: At Paisley, Lake county, J. W. Howard's quartz assays \$80 per ton and a cyanide test is being made in San Francisco.—The mile ditch has been completed for the Jump-off-Joe M. Co. The company employs twenty men getting ready for the winter run.—The J. C. Lewis placer mine at Leland is in operation with twenty men. He will operate two mines this season. The Steam Beer mine is ready for operations, the water in the big ditch having come through last week.—E. A. Smith is having a test carload of ore crushed in the Ashland mill from his Uncle Sam mine near Gold Hill.—C. D. Crane of the Oro Fino mine, Jump-off-Joe, had two carloads of ore crushed in the Ashland mill this week.

Jacksonville Times: Booth & Clark have put a carload of hydraulic pipe on their property in Grave Creek district.—G. E. Morse of San Francisco and M. Cooper are visiting the Swayne M. Co.'s property on Big Applegate, in which they are largely interested. The enterprise promises well.

Seattle Times: The Black Butte mine near Cottage Grove is turning out quicksilver at the rate of \$30,000 per month. The output will average a ton a day for the year round, and the smelter has a mountain of cinnabar ore to draw on. A smelter costing \$66,000 was erected during the summer and commenced operations October 10. The Black Butte Co. is composed of J. Gamble, Capt. Chilcott, J. E. Chilberg, W. Hastings and J. Behrman.

Baker City Democrat: The 10-stamp mill at the Badger mine, Susanville, is in operation with satisfactory results.—On the Bull of the Woods mine there is an 8-stamp mill run by water power. The company has forty-two men employed. A shipment of sixteen tons returned \$1741 net.—Worsham Bros. who own a claim near Malheur, have bought a 3-stamp mill and will also do custom work. D. Bruner will furnish 100 tons from his mine and pay \$4 per ton for working. The Last Chance and Red Oxide owners are, also, getting out ore for immediate reduction.—At the Richmond mines near Sumpter, the third ledge has been struck, and work is being rushed.

Grant's Pass Journal: M. McWilliams is opening the Beswick & Potter mine, near Grant's Pass, and has considerable ore on the dump.—Dr. De Bar, Jacksonville, has over forty tons of ore out, and as soon as there is sufficient water the mill will be started.—J. J. Martin, Supt. Seattle M. Co., in Watkins district, is getting ready for the winter's run.—The Lance M. Co. started the pumping plant on their extensive placer ground last week.—The Golden Key M. Co., which has bonded the Braden mine and other properties near Gold Hill, will soon begin work.

Canyon City News: In the Granite district Eastern people are bonding properties with a view to developing them.—Sinking shafts in the river near John Day continue. Pumping and hoisting machinery have been placed.

—La Bellevue mill has closed for the winter. The mine, however, will continue development. The management contemplates enlarging the capacity of the mill in early spring.

SOUTH DAKOTA.

The Portland mine, Bold mountain, resumed operations under the new organization of the company, and Supt. Chapman has put forty men to work. The Portland is about the oldest mine in the Bold Mountain belt and was located in '77.

UTAH.

With the starting up of the Cigale plant, West Dip, the district not including the Chloride Point plant, will have seven mills in operation.

In the 300 level of the Eva group, in Diamond, comprising six claims, an 8-foot vein of mineral has been cut into that is of good value. There is also a small vein of fine galena in the same strike. From one claim also silver ores of good values have been extracted.—The Daisy at Mercur shipped another batch of auro-cyanides, the second in ten days. About 112 tons a day are produced.

—The Star Consolidated has been added to Tintic's big properties. Samples from the new strike show 50 per cent copper; the amount of gold has not yet been determined.—The Dewey mill at Bingham made a successful run on Winnamuck ores.—The Massachusetts mine at Park City in a tunnel 600 feet struck a good body of smelter ore.

In the Orient mine at West Tintic 18 inches of ore has been uncovered, which assays on an average 27 per cent lead, from twenty-four to thirty ounces silver and \$3 to \$6 in gold. The zone has been prospected on a crosscut 60 feet to the north and 40 feet south, and it is said that there is no sign of a wall yet.—The Bingham tunnel has passed the 1000-foot station and is driving to connect with the mines along its course.—With the second furnace in operation at the Hanauer smelter the plant has a capacity of 200 tons of ore daily.

—The Ajax of Mammoth shipped another 100-ton lot of high-grade copper and gold ore last week.—In the Uncle Sam and Humburg mines at Eureka in July the earnings amounted to \$12,638 and for August \$8238. For September they reached \$19,640, while in October the fell back to \$11,729, with \$4316 thus far in November. The expense of producing these amounts is between \$8000 and \$9000 per month.—In the ore and bullion market at Salt Lake City the settlements reached \$162,685 for the week ending Nov. 19.—The transfer of the Showell placer near Bingham having been made to the Dalton & Lark, prospecting will begin in a few days.

At Provo, St. V. Le Sieur sold W. H. Smith and J. E. Price of Denver, Colo., the Castle Peak gilsonite group of mines for \$50,000. The mines are in Wasatch county. Smith & Price will erect a steam hoist on the property at once and make other improvements needed to increase the output. They are said to have a contract for 500 tons of gilsonite monthly, which goes to Bremen, Germany.

At Park City the Ontario Silver M. Co., R. C. Chambers Supt., has been granted a 25-year franchise to operate an electric plant and to furnish light, heat and power to the pub ic.

At Mercur, the Overland mill is grinding ore. An electric hoist will be put on the mine, as the steam hoist is hoisting only ninety tons of ore per day, which is crushed in four hours. The company has begun leaching and tanks are filled with pulp.

Shipments from the Tintic district for last week were sixty-three carloads of ore, fourteen cars of concentrates and thirty bars of bullion.—The pumps at the old Honorable mine in Stockton were started. The mine was abandoned when the water was encountered, several years ago.—From new ground in the Sacramento at Mercur, samples of ore afford a general average of \$149 gold per ton.—Work has resumed on the Silver King mine at Stockton.—Work on the Badger locations at Mercur has resumed. The ground was productive of some good values two years ago.—At Mercur, Bunch & Cummings are running a drift on the vein in the Eagle at a depth of 200 feet. The vein is 12 feet thick and carries values of \$4 per ton.—The Shamrock at Stockton, on which work has resumed, at a depth of 450 feet, last week broke into a body of galena from which the raising of ore has begun.

Eureka Republican: The R. G. W. tunnel at Silver City, is in 200 feet and has cut a vein of good quartz.—Work has resumed on the Annie Con. property under the management of G. Bridges.—Ore shipments from Park City last week amounted to 1,541,610 pounds.—Silver City shipments for the week were forty-eight carloads of ore.—At Eureka in the Centennial Eureka, a new strike is recorded.—In the Commercial mine a good body of ore has been uncovered.—At Park City a new chute of ore has been disclosed in the Valeo.—The Red Wing of Bingham has made a good ore strike.—Good ore has been broken into in the Hercules of Lion hill.—A new ore body has been uncovered in the Northern Light at Bingham.—A consignment of auro-cyanides from the Wilson Leaching Co.'s mill, weighing 600 pounds, has been marketed.—From the Geyser-Marion at Mercur a consignment of 500 pounds of auro-cyanides reached the sampler, and the Old Jordan & Galena of Bingham shipped 122 pounds.

WASHINGTON.

At Republic the Gold Leaf Co. are making about 4 feet a day. The tunnel is in 245 feet.—The Republic is drifting north and south on the 400 level.—A tunnel has been started on the Jim Blaine ground to cut the Princess Maude ledge at a depth of 150 feet. It will be 250 feet long and be completed in eighty days.—J. W. McCann & Co. have begun work on the Victory claim with two shifts.

The Cougar M. Co., near Meyers Falls, has resumed on a tunnel to crosscut the ledge at a depth of 200 feet.—Work has started on the Lone Pine, at Republic camp, on the tun-

nel that is in 150 feet, where it cut the ledge. Crosscutting showed 14 feet of ore.—The Gold Basin M. & I. Co., at Gold Basin, is working on six claims, which are making a good showing.

The Puget Sound Reduction Co., Everett, Wash., last week shipped 200,000 pounds of lead to the American Trading Co. at Shanghai, China. The order from the Trading Co. calls for several million pounds of lead.—At the Everett, Wash., refinery last week twenty bricks of gold and silver, containing 1100 ounces to the brick, were run off at one draw.

In the Republic No. 2 the tunnel is in 130 feet and getting ore that assays \$17 a ton. The tunnel will give a depth between 400 and 500 feet in 200 feet additional.

FOREIGN.

BRITISH COLUMBIA.

J. T. Richards of Santa Barbara, Cal., for the St. Anthony's M. Co., bought the holdings of the Omineca Con. M. Co., on Germansen creek, Omineca. The property includes twenty-five bench and creek claims, 6000 miners' inches of water, four miles of ditching and some timber-cutting privileges. Hydraulic machinery will be secured at once and preparations made for early spring work.

From Greenwood it is reported "miners in the Knob Hill mine have crosscut the ledge, and demonstrated that the ore body is 134 feet wide. The ore will average \$20 per ton, chiefly in copper."

From Greenwood it is reported that the miners in the Knob Hill mine have crosscut the ledge and it is 134 feet wide. The ore will average \$20 per ton, chiefly in copper.

Rossland Miner: The Le Roi last week distributed \$27,000 among its 300 employees. The incidental expenses for running the mine during the month were about \$7000 more.—

The new chute of ore in the 500-foot level of the Le Roi has widened to 11 feet. The management will follow the chute from the 600-foot level up.—The War Eagle Con. M. & D. Co., Rossland, in the report for the year ending Oct. 1 shows that 416 feet of development work was done. Shipments were not commenced until May, but from that time until October 1, the total output of the mine was 28,528 dry tons of an average gross market value of \$23.52. The total gross market value of the shipments was \$670,735.28. The total smelting charges were \$313,891.80 and the net value of it was \$356,843.98. The total value of the ore now in sight, consisting of 100,000 tons of an average value of \$17 per ton, is estimated at \$1,700,000. A year ago the reserve amounted to only \$1,105,000. Since then there has been shipped from the property ore to the total value of \$670,735.28. Despite these shipments the reserve has increased 55 per cent. The management has been able to treat ore carrying \$4.12 less value than in the previous year by increased tonnage and reduced smelter charges.

Rossland Miner: The first payment on the bond of \$20,000 on the Big Chief, East Kootenay, was made on the 1st inst. Seven men are developing the property. The ledge is 5 feet in width.—At Palmer's Bar, a company is said to have secured a twenty-years' lease of two miles of ground, and has taken up 500 inches of water, and that a \$25,000 hydraulic plant will be placed in the coming season.

The Porto Rico mine at Ymir is developed by three tunnels of an aggregate length of 1050 feet. The ore is free milling and will concentrate about 10 to 1, with values that will average \$40 per ton. The vein is 22 inches in width. The mine is equipped with a 5-drill compressor, a 10-stamp mill with a crushing capacity of thirty tons per day, and an aerial tramway half a mile in length from the mine to the millsite.—The ore shipments of the Slocan district for ten months ending Oct. 31 were 27,000 tons.

Ymir Miner: The Salmo Con. G. M. & D. Co.'s group of claims near Ymir have two shafts sunk on the lode. There are five ledges running parallel throughout the group from 12 to 40 feet wide. The vein carries gold, silver and lead, assays from which have yielded from \$24 to \$61.33. The average assay is \$30.

Rossland Miner: In spite of the depreciation of the price of silver, the long haul to the U. S. smelter, and the high U. S. import tariff on ores containing lead, the greatest dividend paying mine in British Columbia is the Payne, a galena proposition in the Slocan. For nearly two years past the Payne mine has shipped an average of fifty-eight tons of its valuable ore daily. After deducting freight, duty and smelter charges, this nets the owners over \$80 a ton, or \$460 per day. There are now about 125 men employed at the mine, and it is a liberal average to allow \$4 each per day for total expenses, or \$500 for the entire force. Thus it is seen that the mine is paying a profit of \$4140 daily, including holidays and Sundays. As the output is well known by many to be running from \$1600 to \$1800 tons, month in and month out, the above figures are none too high. Taking the daily net income as a basis, the mine yields a profit of nearly \$125,000 monthly, or \$1,250,000 annually.

Rossland Miner: The ore shipments from the mines at Rossland from Jan. 1 to Nov. 1, 1898, were 108,048 tons. The ore shipments for seven days to Nov. 12 were 4635 tons.

CHINA.

Hitherto the development of China's mineral resources has been studiously discouraged and opposed by the authorities. The first thing required is permission to the people to avail themselves freely of their untouched wealth underground. The absurdity of the present situation in this regard is fairly illustrated by the fact that steamboats at Ichang, 1000 miles inland on the Yangtse river, are compelled to burn costly imported Japanese coal, although Ichang is situated on the borders of one of the richest coal fields in the world. The coal deposits of that region are so remarkable as to arrest the attention of

casual travelers, but the Government will not allow them to be worked. If these mines, with the incidental iron ores and petroleum springs, were permitted to be exploited, there would be such a trade that the available steamers and junks would hardly be able to carry it all. A gold mining company was organized in 1886 in the province of Szechuan by a Chinaman named Tong, who studied mining in the United States. He got the sanction of the Viceroy to buy machinery, but the people petitioned the latter officer to stop the work. Samples of gold from the mines had been shown to the Viceroy, and the petition was not granted. Szechuan has a population nearly equal to that of France, and an area about as great.

Shantung is described as one vast mining field. Gold, silver, copper, iron, lead, coal and even diamonds are found. The gold mines have been worked by California miners, but they had to abandon the task, owing to the obstructiveness of the native officials, ten years ago. It is expected that, with the advent of the locomotive, in the near future, great activity will be shown in exploiting gold, coal and other minerals. Were the province under any other rule it would be one of the greatest mining sections in the world. It has a population of 29,000,000.

MEXICO.

Two Republics: The mines of the Penoles M. & S. Co. are near Mapin, Durango, and the smelters are five miles from the mines, connected by railroad. The present company has been in operation seven years and has made a success. There are about three miles of old and new shafts and drifts. The ore is not of a very high grade. About 2000 meters south of the hoisting machinery there is another extensive ore body 50 feet in width. The workings have reached a depth of 2000 feet and large bodies of ore are found. The Spaniards worked these mines 150 years ago, and had no other means of hoisting the ore save on the backs of peons.—At Chihuahua a large smelting plant is soon to be erected, and from the Santa Eulalia mines, a few miles from the city, the facilities for transporting ore to Chihuahua are being improved. The new smelter will have a capacity of 2000 tons daily.

Nogales Oasis: Near Matape, Sonora, the Sonora M. & D. Co. have opened in their Money-maker mine a 2-foot ledge of free milling gold ore which goes \$210 per ton. They ship to a mill ten miles distant.—Unwatering the Ahogado mine by J. Wanless & Co. is progressing. The old workings are partly accessible. As soon as bottom is reached the drifts and levels will be cleaned out and extensive development work begun.—At Pilares, Sonora, the Le Roy Co. is operating on an extensive scale. The company has 500 tons of ore running from 600 to 3000 ounces, for shipment.—The mines at Pilares are owned by F. H. Garcia, a part of which is 4500 acres leased to King & Newman of El Paso. The latter are working on fifty places on the leased ground and are taking out tons of rich ore every day. The ore running less than 600 ounces is put on the dump, where there are 100 tons of it. There is a wagon road being constructed from Pilares to Casas Grandes and when completed the lower grade ore can be shipped to El Paso.

THE PHILIPPINES.

With the celerity that characterizes all U. S. government productions, the national government has issued from Washington, D. C., a memorandum on the mineral resources of the Philippines, being advance sheets of the forthcoming report of Geo. F. Becker, who was recently sent by Director Walcott of the U. S. Geological Survey to examine and report thereon. A portion of the report is as follows: Gold is found at a vast number of localities in the archipelago, from northern Luzon to central Mindanao. In most cases the gold is detrital, and is found either in existing water courses or in stream deposits now deserted by the current. These last are called "aluviones" by the Spaniards. It is said that in Mindanao some of the gravels are in an elevated position and adapted to hydraulic mining. There are no data at hand which indicate decisively the value of any of the placers. They are washed by natives, largely with coconut shells for pans, though the batea is also in use.

In the province of Abra, at the northern end of Luzon, there are placers, and the gravel of the river Abra is auriferous. In Lepanto there are gold quartz veins as well as gravels. Gold is obtained in this province close to the copper mines. In Benguet the gravels of the river Agno carry gold. There is also gold in the province of Bontoc and in Nueva Ecija. The most important of the auriferous provinces is Camarines Norte. Here the townships of Mambulao, Paracale and Labo are especially well known as gold-producing localities. Mr. Drasche, a well-known German geologist, says that there were 700 natives at work on the rich quartz veins of this place at the time of his visit about twenty-five years ago. At Paracale there are parallel quartz veins in granite, one of which is 20 feet in width and contains a chute in which the ore is said to assay thirty-eight ounces of gold to the ton. One may suspect that this assay hardly represented an average sample. Besides the localities mentioned, many others in this province have been worked by the natives.

The islands of Mindoro, Catanduanes, Sibuyan, Samar, Panay, Cebu and Bohol are reported to contain gold, but no exact data are accessible.

At the south end of the small island of Panay, which is just to the south of Leyte, there are gold quartz veins, one of which has been worked to some extent. It is 6 feet in thickness and has yielded from \$6 to \$7 per ton.

In the island of Mindanao there are two known gold-bearing districts. One of these is in the province of Surigao, where Placer

and other townships show gravels and veins. The second district is in the province of Misamis. Near the settlement of Imponan, on the Gulf of Macajalar, there are said to be many square kilometers of gravels carrying large quantities of gold with which is associated platinum. The product of this district was estimated some years since at 150 ounces per month, all extracted by natives with bateas or coconut shell dishes.

Copper ores are reported from a great number of localities in the Philippines. They are said to occur in the following islands: Luzon (provinces of Lepanto, Benguet and Camarines), Mindoro, Capul, Masbate, Panay (province of Antique), and Mindanao (province of Surigao). Many of these occurrences are probably unimportant. The great island of Mindanao, being practically unexplored, is full of possibilities, but as yet no important copper deposit is known to exist there. An attempt was made to work the deposit in Masbate, but no success seems to have been attained. On the other hand, northern Luzon contains a copper region which is unquestionably valuable. The best known portion of this region lies about Mount Data, a peak given as "2500 meters" in height, lying in latitude 16° 53', longitude 120° 58' east of Greenwich, or 124° 38' east of Madrid. The range of which Data forms one peak trends due north to Cape Lacay-Lacay, and forms a boundary for all the provinces infringing upon it.

Data itself lies in the province of Lepanto. In this range copper ore has been smelted by the natives from time immemorial and before Magellan discovered the Philippines. The process is a complicated one, based on the same principles as the method of smelting sulpho-salts of this metal in Europe and America. It consists in alternate partial roasting and reduction to "matte" and eventually to black copper. It is generally believed that this process must have been introduced from China or Japan. It is practiced only by one peculiar tribe of natives, the Igorrotes, who are remarkable in many ways.

Vague reports and the routes by which copper smelted by natives comes to market indicate that there are copper mines in various portions of the Cordillera Central, but the only deposits which have been examined with any care are those at Mancayan (about five miles west of Mount Data) and two or three other localities within a few miles of Mancayan. The deposits of Mancayan are described as veins of rich ore, reaching 7 meters in width and arranged in groups. Mean assays are said to show over 16 per cent of copper, mainly as tetrahedrite and allied ores. The gangue is quartz. The country rock is described as a large quartzite lens embedded in a great mass of trachyte. An attempt has been made by white men to work these deposits, but with no considerable success. The failure does not seem to have been due to the quality or quantity of ore found.

A lead mine has been partially developed near the town of Cebu, on the island of the same name.

The most important deposit of argentiferous galena is said to be at Torrijos, on the small island of Marinduque (latitude 13° 34'). A metric ton, or 1000 kilograms, is said to contain 96 grams of silver, 6 grams of gold and 565.5 kilograms of lead.

In Camarines, a province of Luzon, lead ores occur, but are worked only for the gold they contain.

There is iron ore in abundance in Luzon, Caraballo, Cebu, Panay, and doubtless in other islands. In Luzon it is found in the provinces of Laguna, Pampanga and Camarines Norte, but principally in Bulacan. The finest deposits are in the last-named province, near a small settlement named Camachin, which lies in latitude 15° 7' and longitude 124° 47' east of Madrid. A small industry exists here, wrought iron being produced in a sort of bloomery and manufactured into plowshares. The process has not been described in detail, so far as I know. It would appear that charcoal pig iron might be produced to some advantage in this region. The lignites of the archipelago are probably unsuitable for iron blast furnaces.

Rumors of the occurrence of quicksilver in Panay and Leyte have failed of verification. Accidental losses of this metal by prospectors or surveyors sometimes lead to reports of the discovery of deposits, and others are not seldom mistaken for impure cinnabar.

FOR SALE.

4 Woodbury Concentrators with new belts. Machines in good condition. For price and particulars, apply to EDWARD GOODWIN, Supt. Montauk Con. G. M. Co., Newcastle, Cal.

FOR SALE CHEAP.

2 Edison Bi-Polar Dynamos, 540 Lamps, with Switchboard and Apparatus Complete; 1 60-H. P. McIntosh & Seymour Engine; 2 60-H. P. Babcock and Wilson Boilers;

All in first-class condition. Address PACIFIC TELEPHONE & TELEGRAPH CO., 216 Bush Street, San Francisco, Cal.

WANTED.

Second-hand Corliss Engine of 800 to 1200 H. P.

Must be in first-class shape. Give full description and price. Answer quick. Address A. B. STEFFENS, No. 855 The Rookery, Chicago.

Diamond Drill for Hire.

DRILL CAN BE HIRED, TOGETHER WITH EXPERT TO OPERATE.

DIAMONDS FOR SALE.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can

be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

MINERS, ATTENTION!

We beg to call attention to our RISDON HAMMERED PROJECTILE STEEL SHOES AND DIES, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density. These Shoes will outlast any other make and will not chip or cup. We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set. Our prices are as low as any, and the article we offer should commend itself to all mine owners and mill men.

VULCAN ROPEWAY

— WITH —
**AUTOMATIC ORE LOADER AND
AUTOMATIC DUMPING DEVICE.**

For Conveying
Ore, Cordwood,
Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly,

J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 24, 1898.

Thanksgiving Day! and the rain upon the foothills falls not more gently to the earth than the thousand little, unnoticed blessings that drop into our daily lives. This being a holiday, we can only give yesterday's quotations:

SILVER.—London, 28d; New York, 60%; San Francisco, 60%; Mexican Dollars, 47½¢ @ 47%. New York exchange, sight, 15; telegraphic, 17½ cents premium.

LEAD.—New York dispatch, dull, \$3.67½ bid, \$3 72½ asked. The firm naming the settling price for leading miners and smelters at the West quotes Lead \$3.50.

Local, pipe, 60¢@7¢; sheet, 6½¢@7¢; pig, 5½¢; bar, 6¢.

COPPER.—New York reports Lake 13, an advance of one cent in one month.

IRON.—American, soft, \$21.75 and \$23.75 per ton; Scotch, \$24.25.

SPELTER.—½¢@7.

TIN.—Pig, 19½¢, 19½¢ ton lots; Bar, 20¢@25¢ single.

ANTIMONY.—9½¢, 10.

RABBIT METAL.—10-12-14-16c; best 24c.

QUICKSILVER.—Local, \$42; export, \$37.00 @ \$7.50; carload lots, special rates.

POWDER.—F. O. B., San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½¢; less than one ton, 17½¢. No. 1* 60%, carload lots, 18½¢; less than one ton, 15½¢. No. 1** 50%, carload lots, 11½¢; less than one ton, 13½¢. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½¢; less than one ton, 11½¢. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kgs, \$1.50 per keg; less car lots, \$2 per keg.

FUSE.—Triple tape, \$5.10 per 1000 feet; double tape, \$4.35; single tape, \$3.45; Hemp, \$3; Cement No. 2, \$4.35; Cement No. 1, \$3.45.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9.

COAL.—San Francisco coast, yard prices: Wellington.....\$3.00 Coos Bay.....\$5.00 Seattle.....6.00 Southfield.....7.50

Cargo lots, Eastern and foreign: WallSEND.....\$ 7.50 Cumberland.....\$ 9.00 Brymbo.....7.50 Cannel.....9.50 Pennsylvania, hd., 14 50 Welsh Anthracite. 12.50 Scotch.....8.00 Rock Springs.....7.60

COKE.—Foreign, \$13; domestic, \$12 per ton.

OILS.—California Castor, pure, cs., \$1.08 per gal.; bbl., \$1.03; pure No. 2, cs., 85c; bbl., 80c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, \$1.06; less than 200 gals., \$1.10; in bbls., 4c per gal. less than case; Baker's Crystal, \$1.26; China Nut, 52c; Linseed, strictly pure, boiled, bbl., 44c; cs., 40c; raw, bbl., 42c; cs., 47c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 39c; cs., 43c; raw, bbl., 36c; cs., 41c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 17½¢; Astral, 17½¢; Star, 17½¢; Ecocene, 19½¢; Extra Star, 21½¢; Elaine, 22½¢; Water White, bulk, in tanks, 11½¢; Mineral Seal, iron bbls., 21c; wooden bbls., 23½¢; cs., 28c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 13c; do.,

cs., 18c; 86 deg. Gasoline, bulk, 20c; do., cs., 25c; 63 deg. Naphtha or Benzine, deodorized, in bulk, per gal., 11½¢; do., in cs., 16½¢; Lard Oil, Extra Winter Strained, bbl., 56c; cs., 61c; No. 1 bbl., 46c; cs., 51c; Neatsfoot Oil, bbl., 65c; cs., 70c; No. 1 bbl., 55c; cs., 60c; Sperm, crude, 60c; Natural White, 65c; Bleached do., 70c; Whale Oil, Natural White, 40c; Bleached do., 45c; Cocoa, cs., 55c; Pacific Rubber Mixed Paints, white and house colors, \$1.25@1.35 per gal.; wagon colors, \$2@2.25.

Assessment Notices.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of November, 1898, an assessment (No. 16) of 2 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of December, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 14th day of January, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
Office—217 Sacramento street, San Francisco, California.
CHARLES BYRNE, Secretary.

CONSOLIDATED ST. GOTHARD GOLD MINING COMPANY.—Location of principal place of business, 113 Crocker building, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of November, 1898, an assessment (No. 16) of Ten Cents (10c.) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 113 Crocker building, sixth floor, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of December, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 30th day of December, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. F. HOLLING, Secretary.
Office—113 Crocker building, sixth floor, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of November, 1898, an assessment (No. 85) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of December, 1898, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 30th day of December, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
ALFRED K. D. BROW, Secretary.
Office—Room 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of November, 1898, an assessment (No. 2) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 213 Jackson St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of December, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 12th day of January, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

UNFAIR COMPETITION.

Our recent announcement that inferior goods had been sold and billed on the coast as our goods, and that our trade-mark numbers had been counterfeited, has disclosed an even greater extent of these practices than we had supposed to exist. To make the resulting damage to the reputation of our goods as small as possible and to protect our would-be patrons we repeat:

All our catalogue goods, except those listed by us as manufactured by others, are stamped with our name "Keuffel & Esser Co." or our initials "K. & E. Co." and where there is room for it, with our trade mark.

Our German drawing instruments bear only the trade marks or We never stamp our goods with catalogue numbers only, and goods so stamped are therefore not ours. All our goods are fully warranted to conform to the description we give of them in our catalogue and to be of the quality and grade specified. We make some lines of cheaper goods for the jobbing trade, but they differ from our catalogue goods in quality and appearance. These inferior goods are not stamped with any of our trade marks. Our catalogue goods are not furnished to any dealer or agent without our complete stamp as described above, and any claim that we furnish our catalogue goods by special arrangement without our stamp is therefore an attempt to deceive. Our special papers in rolls or sheets

Duplex Universal Anvil Baragon Normal

are watermarked or stamped along the edge with their name. Any claims that our papers are furnished by us in bulk without these names or that these papers have been obtained otherwise than through us, are absolutely false. We will thankfully accept any information bearing on the counterfeiting of our trade-mark numbers or the palming off of other goods as ours.

Very respectfully, KEUFFEL & ESSER CO.

Mine Management.

The minute details given in the issues of the 5th and 26th ult. by two California mine managers, illustrate a phase of the mining business often overlooked by corporate owners—the necessity for exact, specific information of the smallest details of the business. Even in gold mining, with no competition, no business rivalry, an assured market at an established price for the product, there is constant need of rigid economy, attention to little things and a thorough grasp of the most minute detail to insure profit or to guard against possible loss. In every shop, factory, store, or commercial establishment of any kind, it is the little savings that make all the difference between profit and loss. The writer was recently told by the manager of one of the largest department stores in the United States that the cash discounts he secured on large purchases constituted almost entirely the firm's source of possible annual profit. In the big meat-packing establishments of Chicago it is the utilization of every shred of the animal that makes the profit: the sale of meat, alone, would entail a loss. And this brings us to the point that we would make, viz., that in this regard of mine profit or loss, all depends on the manager. If he understands his business he can, ordinarily, make a mine pay: if he doesn't, he can gouge its eyes out and cause assessments and closing down. This does not mean that he must take things out of the hands of the shift boss, or

GREEN MOUNTAIN, GRAY ROCK, DIAMOND; SYNDICATE LODE, BUTTE, MONTANA. (See page 562.)

foreman, or superintendent, but that he must be a practical, experienced man who knows what ought to be fairly expected from every man in the mine's employ, what every bit of labor ought to produce; not in a niggardly, stingy spirit, but with full realization of the fact that anything and everything that costs money should produce money; that there should be no pets nor favorites, no drones nor "soft jobs," and that every dollar be spent as though it were his own. He should be able to do anything and everything in or around a mine and then be careful not to do it, but to surround himself with men who can each attend intelligently to his particular duty. Such a man is worth considerable to his employers, and even at a high salary is a good investment. The biggest mistake a mining company can make is to suppose that because a man is "sharp," or a "good fellow," or has made a success at something else, that he can run a mine.

Necessary Notice.

Among other committees of the California State Miners' Association recently appointed was one to take charge of the mineral exhibit at the Paris Exposition. If this committee is to be purely an ornamental one, not to be heard from till the '99 meeting of the convention, and then report that it still awaits the pleasure of the convention, it were better to have no committee at all. If its members are given opportunity to get to work and accomplish something, the committee is the most important, in a general way, of any one so appointed. The appointment of the committee assumes that California is to be represented at Paris in 1900, and that the California Miners' Association is to take charge of the matter—two assumptions not warranted by the facts, though the good will of the Association is indicated in the creation of the committee. California tacitly announced this year that it did not want adequate representation at the Omaha Exposition. There was a great opportunity to advertise the State's mineral resources to 5,000,000 people, and other commonwealths, with better business grasp, eagerly seized the desirable chance to their profit. In this California acts like a staid, long-established business house that considers itself so well known and important as to render advertising unnecessary, and when it finds young, energetic rivals taking its business away is surprised at the lack of appreciation or discrimination on the part of the public. This is an age of advertising, and anything of standard merit, whether a business, or an industry, or a State, should use every honest chance to get favorable notice. At Paris in 1900 will be a fine opportunity for California and every other American State. With such opportunity three things are necessary—the intent to use it, the money to properly place the exhibit, and the men to do it.

Such notice is necessary. No matter how rich any State is in its mineral resources, they cannot be suitably developed without such advertising as such expositions will afford. To do this is beyond the province or the purpose of any miners' association; at the start there should be at the State's disposal at least \$25,000, and the men in charge of it should not be hampered by the necessity of other daily occupation. Were such a committee duly delegated to-day, and given the amount stated, they could faithfully devote the time between now and the opening of the Paris Exposition, and not have an hour nor a dollar too much. The California Miners' Association deserves credit for indicating its realization of these things, but the idea needs to be worked out on broader lines than the purpose or the policy of the Association make possible.

This paper suggests that the first main requisite is money, which the State could with propriety furnish, and that the committee appointed by the

Miners' Association can begin by concerted action to get adequate appropriation from the State next month in the Legislature. Nothing less than \$25,000 will be of any avail, and any aid from any reputable source should be invoked.

Property Rights of Relocators.

Never in the history of this paper were so many inquiries received as are now daily sent here regarding current mining topics. Many of them are answered by mail; others are grouped and answered in "Concentrates," the questions themselves being omitted to save space; several of the questions each week have either been answered recently, or are impossible of satisfactory reply. As is natural at this season of the year a large percentage of the present inquiries relates to locations, assessment work, etc. This paper does not undertake to answer any such question authoritatively; and in cases involving property values it is always more ultimately satisfactory to get competent legal opinion. This last advice was recently given an Idaho man who wrote asking if he could relocate an abandoned property with a 5-stamp mill on it, but he writes back that though "all the lawyers" up there tell him "he can take up the property and do what he likes with the 5-stamp mill" yet, he hesitates, and wants "to know what the MINING AND SCIENTIFIC PRESS thinks about it." As is often the case, simultaneously with this query comes one from Nevada City, Cal., with precisely the same proposition involved, another from Prescott, Arizona, a fourth similar case from Utah. The Nevada City man argues it a little in his letter. He says:

"The parties who put up the mill failed to do their assessment work within the time required by law. Can I locate the claim and hold the mill to the exclusion of the men who put it there and owned it up to the time they failed to do their assessment work? Lawyers here tell me that I can hold all machinery on an abandoned claim, but I don't see what interest the U. S. Government has got in the personal property placed on a mining claim. It seems to me that the Government can only give a title to the land which belongs to it, and that any machinery placed on a mining claim belongs to those who put it there. We want an opinion from the MINING AND SCIENTIFIC PRESS. Also, can feeders, belts, wire cable, attached to cars used in lowering ore by inclined tramway, be sold lawfully, as personal property, the same as supplies? Cannot the owner of the mill recover damages for selling them? Was there ever such a law passed to give locators of abandoned claims a right to hold machinery placed thereon by previous locators?"

This whole subject is discussed at some length in "Lindley on Mines," and is of sufficient importance to justify an excerpt therefrom. Under the heading, "Right of second locator to improvements made by the first," appears the following:

"When the estate of the first locator becomes extinguished by his failure to comply with the law, and the second enters and perfects his relocation, the dominion and control over the property passes to the latter. If the former thereafter remains in possession, unless at the time of the relocation he has resumed work, he is a mere occupant without color of title, and the completion of the second location, if effected peaceably and in good faith, operates in law as an ouster of the prior occupant¹. Thereafter the relocater is clothed with 'the exclusive right of possession and enjoyment of all the surface included within the lines of the location'². Such improvements or betterments as have been placed upon the property by the original locator, if they fall within the class designated as fixtures, become a part of the realty, and the subsequent appropriation of the land carries with it, necessarily, whatever may be affixed to it. Prior to the determination of his estate by the perfection of a relocation it cannot be doubted that the prior locator may sever and remove all machinery, buildings, and other improvements which, by the manner of their attachment to the soil, have become a part of the freehold. But his right of entry for that purpose ceases when

his estate is terminated. It is a general rule of law that all improvements of this character upon public lands of the United States pass to the purchaser from the Government³, and the relocater of a mining claim holds his estate by purchase⁴. One cannot set up equities in improvements against the Government, or a purchaser from it⁵, and the statutes which permit their removal after the land has passed into private ownership are void, as interfering with the primary right of disposal of the soil reserved to the United States upon the admission of the several States⁶. It is unnecessary to enter into a detailed discussion of what constitutes fixtures. It has been frequently held that machinery, such as engines, boilers, hoisting works, mills, pumps and things of a like character annexed to the soil for mining become part of the freehold⁷. As such, they will pass to the relocater.

"While this is undoubtedly true, upon application for a patent the relocater will not be permitted to include in his estimate of the value of improvements required by law to be made as a condition precedent to patent, any of the labor done or improvements made by the original locator.⁸ Expenditures and improvements for such purpose must have been made by the relocater or his grantors.⁹"

The above appears to be sufficient answer to our correspondents' inquiries.

Since the above was in type, another "hard nut to crack" comes, in the following, from one, who, like the rest, pins his final faith on the decision of this paper. He says:

"Can a mill site on which a mill has been erected be located as a mining claim? The mill site is not patented, but a mill is erected thereon, negating the fact of abandonment."

In answer, it is to be said that mill sites can only be legally located on non-mineral land. If at any time prior to the issue of the receiver's receipt in patent proceedings mineral is discovered within a located mill site in sufficient quantities to justify exploitation, a valid mining claim may be located thereon, provided the entry on the ground is made for that purpose, peaceably and in good faith. The question as to whether the mill site has been abandoned or not is entirely immaterial. (See *Snyder v. Waller*, 25 L. D. 7).

(To forestall the possibility of receiving several further inquiries from readers of this last paragraph to the effect "Would a mining location within the mill site take the mill?" the writer can only reiterate his advice that in all such cases involving values the exact special facts in that particular case be placed before a competent attorney; for, though fully appreciating the compliment conveyed in the request for authoritative statement, the MINING AND SCIENTIFIC PRESS hesitates to assume judicial functions, more especially in the absence of specific knowledge of all the detailed facts.)

COLORADO has seized upon an idea that vigorously pushed is one of the things that will most materially aid in mining development—it is the tunnel. Colorado miners have "dropped on" the fact that the twin expenses of hoisting and disposing of water can in no other way be so simply solved as by tunneling. Tunnel enterprises are springing up in every part of that State's mining counties, and though, of course, like any other good thing, the idea can be overworked, yet the scheme has so many manifest advantages that it is deservedly a favorite. The activity therein is a pointer to other mining communities that languish because of the deterring cost of old-time shaft development.

FROM Nevada comes the doubtful statement that Wm. M. Stewart will not be returned to the U. S. Senate. This is too good to be true. The S. P. is all powerful in Nevada, and that corporation needs him. The only interest this paper has in the matter is the good of the mining industry; so long as Senator Stewart is able to vote in the U. S. Senate, so long needed changes in the Federal mining law will not be made.

MR. TESLA now proposes to run the machinery of the Paris Exposition with electric power sent instantly across the world from Niagara Falls. So long as that airy gentleman has free access to the Sunday publications, there is no limit to the wonderful things he can do—on paper.

Concentrates.

At Butte, Montana, the Butte & Boston Co. has on its payroll 549 men.

SAN FRANCISCO's mining dividends for Nov., '97, were \$90,725; for Nov., '98, \$135,075.

The November dividends of Cripple Creek, Colo., mining companies totalled \$318,250.

"BRASS AND BRASS" means where the two brasses of a bearing are locked together.

In the Butterfield mine, near Quincy, Cal., was found last week a ninety-dollar nugget.

The copper output of Arizona in 1897, according to revised figures, was 81,019,922 pounds.

The deepest vertical shaft in Montana is in Butte—the Green Mountain, 2100 feet in depth.

The last assessment on Con. Cal. & Va. was in May, '98—25 cents per share—delinquent in June.

The Grizzly mine is near Pike City, Cal. It has a 10-stamp mill; nothing has been done there recently.

In '99 the Osceola, Mich., Copper Co. expects to produce 20,000,000 pounds of copper at \$40.90 per pound.

The Mercur M. Co., Mercur, Utah, was awarded a gold medal at the Omaha Exposition for its cyanide exhibit.

An electric hoist of unusual size will be put on the Granite mine at Victor, Colo., to raise ore from a depth of 700 feet.

For the present the headquarters of E. H. Benjamin, Secretary Cal. State Miners' Assn., are at 331 Pine St., San Francisco.

The loss in the transmission of power, for twenty-four miles, by the Electric Power Co. at Canyon City, Colo., is said to be only 7 per cent.

The Cleopatra Smelter at Ouray, Colo., has passed into receiver's hands. The liabilities are given at \$21,000 and the assets at \$32,500.

The dam built by the Victor M. Co. in Josephine county, Oregon, is 50 feet high, 65 feet long at the bottom and 300 feet across at the top.

The projected tunnel from Ward to Sunset, Colo., three and one-half miles long, will require, it is estimated, five years to complete and cost \$500,000.

A CISTERN, to hold just 200 bbls., must be 9½ feet diameter and 12 feet deep. If bricked up, it will take 1560 brick 4x8x2, if laid edgewise, or 3000 if laid flat.

By the accidental explosion of a blast in the Cleveland mine at Springdale, Wash., last week, J. Moriarity was instantly killed and W. Johnson seriously injured.

ACCORDING to the Marquette, Mich., *Mining Journal*, "the Calumet & Hecla Co. can lay copper down in New York at 13c and make 100% on the cost of production."

The Comstock Pumping Association has received all the money called for from the mining companies—\$51,250—to defray the cost of lowering the water 500 feet.

At Hancock, Mich., on the 23th ult., the Franklin stamp mill was destroyed by fire; loss \$150,000. There will be 600 men thrown out of employment for six months.

AFTERMATH of sundry swindles in connection with the Klondike rush is the filing of damage suits in Seattle by men who were defrauded by transportation companies.

"MECHANICAL EQUIVALENT" is the amount of mechanical energy converted into heat; the "mechanical equivalent" of one unit of heat is equal to 772 foot-pounds of work.

ON a California mining location made after Nov. 2nd, '98, it is possible to make the \$50 in work required under the State law apply to and be a part of the \$100 required by the U. S. statute.

LARGE deposits of "pure sulphur ore" are reported discovered four miles from Coyote Wells, San Diego Co., Cal., thirty-five miles north of the Godbe sulphur mines in Baja California.

RECENT findings of alleged "tin" in Colorado are too indeterminate to warrant notice. Tin is appreciating in value, and a tin mine would be second only in value to a copper mine at present figures.

The Tiger-Poorman mine in the Cœur d'Alenes, Idaho, up to 1895 was operated by two companies. From the time of the discovery of the mines in 1884 to 1895 each company paid about \$500,000 in dividends.

THERE is nothing to prevent an inventor from filing an unlimited number of applications for patent for the same subject matter, if some benefit, real or imagined, would seem to justify the additional expense.

RECENT chemical experiments prove that all waters have action on copper; that "hard" water takes up little lead from lead pipes, but that "soft" water and carbonated water so dissolve considerable quantities.

THAT was a good suggestion of Gov. Budd's at the convention of the Cal. State Miners' Association last week, viz.: to have that \$250,000 State appropriation for restraining barriers, etc., specially set over from the general fund.

COMPANIES desiring mention of dividends declared should make statement of the dividend, its date and amount. Nothing of the kind is published herein "second-hand," or from hearsay. The idea is to have the matter accurate.

STORMS' "Mine Timbering" is believed to be equal to the requirements of any miner. It can be had upon application to the Cal. State Mining Bureau, Fourth St., San Francisco. To other than Californian residents there is a charge of 50 cts.

RIGID qualitative analysis has demonstrated within the month the non-existence of the supposed new metal in platinum ore called "davyum." The substance is not elementary, but is composed of rhodium and iridium, with a trace of iron.

THE Reno, Nev., suggestion could be practically pushed by the use of a traction engine. Daniel Best, San Leandro, Cal., makes a road engine that will pull a load of thirty tons up and down a grade of one foot in eight, and of much greater weight on the level.

MISSOURI's State mine inspector claims that his State now leads in production of lead and zinc, and says the output of lead ore for the last fiscal year was 73,687 tons, which sold for \$3,011,055, and that the output of zinc ore reached 139,668 tons, and sold for \$2,927,321.

BUT one pre-emption or homestead right can be used and one can take up only one timber claim. The number of mining claims that an individual or a company can take up is, however, only limited by the ability to do the assessment work necessary to hold them.

In Nevada Co., Cal., there are 234 gold quartz mines and 96

placer mines. There are 67 stamp mills, with an aggregate of 698 stamps; of these 67, 47 are operated by water power, 11 by steam, 5 by electricity and 4 by gas engines. The stamps average 900 lbs. weight each.

SKAGWAY reports that counterfeit bills are made and sent to that place for the purpose of swindling Klondikers who have just come from the interior out of their money. The bills are \$100 silver certificates, and the detectives believe that they are made in San Francisco.

AT the Three Stars mine, near Ophir, Cal., last week, the engineer left the bucket suspended in the shaft while working on a pump some distance away. The brake slipped and the bucket fell 500 feet onto the machine drill at which H. Corr was working, breaking both his legs.

ELABORATE tabulated information as to the carrying capacity of pipes, friction therein, effective H. P., etc., appeared on page 174 of the issue of Feb. 12th, '98, answering the questions received this week from J. D., Boise, Idaho, R. L. N., Asland, Ore., and M. S. L., Breckenridge, Colo.

IN consequence of the rains this week at Nevada City, Cal., Mgr. Eglebright of the South Yuba Water Co. notified the mine owners at Nevada City and Grass Valley who use water for power that they could start their machinery last Wednesday. About 1500 men were enabled to resume work.

PLACER BASIN, IDAHO, in which the work done this summer is said to prove the new camp a permanent and profitable mining section, is practically in the Seven Devils district, and, in common with the mineral regions as far north as Salmon river, is reached by way of Weiser and up the Weiser river.

IN the "Schultze process," the gold ore, without being crushed or roasted, but just as it comes from the mine, is put into a furnace, "oxidized" by heat, purified by gas, hydrated by steam, disintegrated into powder, concentrated by a pneumatic separator, etc. Proof of its practical success has as yet escaped publicity.

IN a note of deep mines in California last week a mistake was made regarding the Magalla, Butte Co., mine. The workings are 4000 feet from the bottom of the shaft, horizontally. The vertical depth is 500 feet. The Kennedy in Amador Co.—2300 feet from the surface—is probably the "deepest" mine in California.

LORD RUSSELL, England's Chief Justice, last month publicly opposed the British "promoter," stating that in the past seven years "the winding up of British stock corporations has resulted in a loss to stockholders and creditors of \$140,000,000." Of this, probably one-twentieth was lost by connection with American schemes.

AT Temple Bar, Nevada, on the Colorado river, the company of hydraulic miners use coal brought from Kingman, Arizona, at an expense of \$28 per ton. A 30-in. pump draws water from the Colorado, which, carried 10 miles, is forced through a 6-in. nozzle, equaling 1000 in. through a 1-ft. aperture under a 165-foot head per minute.

THE capacity or power of an engine is the amount of work it can do irrespective of economy. A 22x36-in. steam engine, running 110 revolutions (660 ft. piston speed) per minute, has, at 80 lbs. initial pressure, a capacity of about 397 H. P.; but it is more economical, that is, uses less steam per H. P., when worked to from 225 to 342 H. P.

A CLOGGED STRAINER, broken or leaky water valves, a leak in the suction pipe, the water valves being stuck open or shut, the water being too hot for the lift, running the pump at such speed as to cause too much friction of water in the suction pipe—these are among the causes why a steam pipe will not work when the steam end is in good condition.

THE South Yuba Water Co. of Nevada county, Cal., has kept a record of the rainfall in that locality for many years. It shows that the precipitation in that county for 1898-99 up to November 29th has been 6.17 inches, the smallest for the past thirty-five years; the lowest previous rainfall was 17.28 inches in 1863-64. The record for 1897-98 was 30.15 inches. The greatest fall was 115.26 inches in 1867-68.

AT Anaconda, Montana, the Anaconda Co. has constructed three tunnels leading into large chambers which catch the fine dust, which is taken out of the chambers every day from the five flues. Each flue produces about 3000 tons of dust containing about 12 per cent copper. It is estimated that \$48,000 in copper is saved from each flue, aside from the gold and silver. After the fumes pass the long flues but little dust goes up the perpendicular stack.

REGARDING the Jacksonville, Or., query as to the size of pipe to carry 1000 miner's inches of water, with a total fall from inlet to outlet of 18 feet in a length of 600 feet, maximum depression of pipe below inlet being 40 feet: Assuming the miner's inch to be an inch under 6-inch pressure, the pipe should have a diameter of 21 inches (diameter being the inside diameter of small courses, or, if taper courses are used, then of the small end of each). The velocity of flow in the pipe will be about 11 feet per second, and suitable provision should be made to prevent the discharged water from cutting ditch banks.

GOLD ores may be divided into two classes: Those that yield up their gold entirely, or nearly so, to treatment with mercury and other methods; those too low grade for smelting and from which the gold cannot be extracted in any other way, or only in so partial a manner as to give no profitable results. The former are known as free gold or free milling ores; the latter are termed refractory or rebellious ores. In these, ingredients are found which act on the mercury or chemicals, preventing effect on the gold and silver it is sought to recover. Many of these ores are especially amenable to the cyanide process.

A SLUICE BOX 5 ft. wide, 32 in. deep, 14 ft. long, on a 5% grade, would easily run 2500 in. of water. It would cost about \$22.50. In its construction would be about 1500 ft. lumber and 25 lbs. nails. There would be 4 sills, each 4x6 in., 7 ft. long; 8 posts, 4x6 in., 3 ft. 2 in. long; 16 braces, each 1½x4 in., 2 ft. long; 2 top rails, 2x7 in., 14 ft. long; 3 bottom planks, 1½x20 in., 14 ft. long; 2 tongues, 1x½ in., 14 ft. long; 2 side planks, 1½x20 in., 14 ft. long; 2 more 1½x12 in., 14 ft. long; 9 riddle strips, 1½x3 in., 5 ft. long; 28 lineal ft. side lining (blocks 3x 20 in.); 28 lineal ft. bracing to hold down sluice, 4x6 in.; 27 blocks 17 in. sq., 13 in. deep.

DURING the year the U. S. Geological Survey has surveyed topographically 30,057 miles, making a total now completed of approximately one-fourth of the area of the entire country, exclusive of Alaska. The field surveys of Indian Territory were completed last June. This latter work has demonstrated that it is more economical to survey large areas in this manner than under the contract system heretofore employed by

the Government in land subdivision surveys. It is anticipated that the 60,000 square miles of forest reserves can be thoroughly and completely surveyed within five years when adequate appropriations are made.

THE amount of heat required to generate one pound of steam depends upon the temperature of the water and the pressure of the steam. The colder the water and the higher the pressure, the more heat required. To make a pound of steam at 212° F. from one pound of water at 32° F., takes three separate lots of heat, viz.: to raise the water from 32° to 212° takes 180.9 heat units; to make that water into steam at no pressure, 992.9 heat units; to raise that steam at no pressure to steam at the atmospheric pressure of about 14.7 pounds per square inch above vacuum, 72.3 heat units; total, 1146.1 heat units, equal to 883,789 foot-pounds of work.

IN California the See Yup and other big Chinese companies send their gold to China without anyone knowing what amount they are getting from the mines they are working, but many of the individual miners and small gangs of Chinese, who are still working about old placer diggings, send a portion of the gold they glean to the San Francisco mint. These roving "bedrock scrapers" work about eight months in the year in the mountains—from April to November—and the mint figures show receipts of \$40,000 a month from them. About \$30,000 a month additional from Chinese goes to the mint through Wells, Fargo & Co.'s express and the banks, a total of \$60,000 a month.

"THE development of the iron industry in the United States," says an Eastern writer, "seems simply marvelous when we consider that iron ore is mined in what is called the Lake Superior district, transported by railroad from 50 to 100 miles to the lake, transported thence by vessels over 800 miles to a lower lake port—and much of it from there to Pittsburg, and even Johnstown, by rail—manufactured into steel, and yet sold at the rate of three pounds for 2 cents. It is the most marvelous and wonderful change that has taken place in this country within the last century, and is as great an astonishment to those engaged in the trade as to anybody else. While the United States is a large producer of gold and silver, she is the largest producer and manufacturer of iron and steel in the world."

THE contract for 328 miles of pipe for Coolgardie, Australia, recently advertised in this journal, was given two Australians, one in Sidney, and one in Melbourne. Their proposition is to make the pipe of steel spirals packed in concrete. Sheet metal is cut into strips of the required width. These are fed into a machine and welded into one continuous strip. As the strip is fed into the machines rivet holes are punched; then the edges of the laps are brought together by machinery and held during the process of riveting, which is all done by compression. The lap is thrown on the outside of the pipe, rendering the inner surface smooth and even throughout its length. A hydraulic cement is packed around the laps to make the pipe water tight. The contractors will get the material in Pittsburg, Pa. The whole matter has been described before, a long technical account of the scheme appearing in the issues of March 12th and June 25th, '98.

BRITISH COLUMBIA seems at present well supplied with smelters. The smelter at Trail, owned and operated by the Canadian Pacific, has treated the Rossland ores exclusively. A lead stack is being added to the plant and the company is trying to get silver-lead ores in the Spokane country. The Pilot Bay, B. C., smelter, built to treat the output of the Blue Bell mines, a low-grade silver-lead output, has not been in operation for some time. It is understood to be now the property of the Omaha & Grant Smelting Co. The Hall Mines Co. smelter at Nelson was built by that company to treat the Silver King mine ore and is in continuous operation. The Le Roi Mining and Smelting Co. plant at Northport, Wash., is exclusively for the Le Roi ore. This company has passed into the hands of the British-American Corporation. A smelter was built in Spokane several years ago by men with a capital of \$1,000,000, but after its completion some dissatisfaction arose over the cost of construction and possible revenue, and the smelter was never "blown in."

ALUMINUM is now being used for electrical conduction. At the works of the National Electrolytic Company at Niagara Falls, N. Y., current is supplied by the Falls Power Company through aluminum cables. The current is started on its journey through bars, after which it is carried by cables. The bars are 25 feet long, 6 inches wide, and ¼ inch thick. Four are placed in parallel, and at every 25 feet they are bolted and riveted together. On reaching a given point the bars are connected up with twelve aluminum cables. These cables are about 1½ inches in diameter, made of No. 10 wire and covered with rubber insulation. In connecting the ends of the bars to the cables, castings which contain sockets are used. The ends of the cables are placed in the sockets, and melted tin is poured about them. In this installation about 22,000 pounds of aluminum are used, and it is estimated that the same work would require 48,000 pounds of copper. The conductivity of aluminum compared with copper of the same section is 63 to 64 per cent, and for the same weight more than double. Aluminum cables are also projected for the new electrical scheme at Snoqualmie Falls, Wash.

ANSWERING six separate inquiries as to placer locations: there is no prescribed "shape;" the individual location cannot exceed twenty acres in area, and the claim need only "conform as nearly as practicable with the U. S. system of public surveys and the subdivisions of such surveys;" two locators can jointly locate forty acres of placer ground, three, sixty, and so on up to eight locating 160 acres, which is the limit; one discovery of mineral is sufficient on any one twenty acres of the entire 160. The same rules as to development, etc., apply to placer as to lode claims, viz.: under the U. S. law "not less than \$100 worth of labor must be performed or improvements made thereon," until patented. Under the provisions of the Act of Congress approved January 22, 1890, the first annual expenditure becomes due and must be performed during the calendar year succeeding that in which the location was made. Expenditure made or labor performed prior to the first day of January succeeding the date of location will not be considered as a part of or applied upon the first annual expenditure required by law. The California State law requires that since May 26th, '97, on any California lode mining claims \$50 worth of work must be done within sixty days after posting the notice of location. A woman, married or single can locate and hold a mining claim. Under the U. S. statutes anyone locating a mining claim any time in '98 after Jan. 1st, '98, has until Dec. 31st, '99, to do the necessary \$100 worth of work or improvements.

The Mining Industry at Butte, Montana.

Written for the MINING AND SCIENTIFIC PRESS.

The city of Butte lies on the southern slope of a mountain spur, overlooking the valley of Silver Bow creek, which drains toward the Pacific. In the vicinity are barren buttes, from which the place derives its name. The center of the town is at an altitude of about 5500 feet above sea level. Continuing from the town to the summit or ridge, an additional height of about 2000 feet is reached. Between the town and the summit, trending east and west along parallel lodes, are the copper and silver mines whose productions have made Butte famous in the industrial world. The area encompassed in the district proper is about four by six miles.

Missoula gulch, starting in the western part of Butte, cuts northerly to the crest of the mountain, near the upper end of which are Centerville and Walkerville. Dublin gulch starts half a mile farther east, parallels Missoula, and breaks in a saddle between hills. At the eastern end of the main mountain spur, where Silver Bow creek comes in from the north, is Meaderville, commercially a part of Butte, where there are some relics of earlier days.

Butte is entered by the Oregon Short Line from the southwest; by the Butte, Anaconda & Pacific from the west; by the Northern Pacific from the east and northwest. A local terminal line traverses all portions of the slope and summit, reaching practically all the mines.

South and east of the city, in Silver Bow valley, are five smelters, each having a concentration mill in connection therewith, operated respectively by the Colorado Smelting and Mining Co., the Butte Reduction Works Co., the Parrot Smelting and Mining Co., the Butte & Boston Co., Montana Ore Purchasing Co. The great smelting works of the Anaconda Copper Mining Co. are at Anaconda, twenty-nine miles west of Butte. The extensive smelting and refining plant of the Boston & Montana Co. is located at Great Falls, on the Missouri river, 170 miles northeast of Butte. The affairs of the Butte & Boston and Boston & Montana are under one and the same management.

The first operations in this district were in the placer beds of Missoula gulch in 1864. At the head of this gulch the Alice mine was opened in 1877 and sold to Walker Bros. of Salt Lake City. Its production of silver, with some gold, has been continuous since that date. For a few years its product was phenomenal, and the town of Walkerville sprang up and teemed with prosperity. The Alice lode trends east and west, dipping toward the south, and is of good width. Its ores to the quantity of seventy-five tons per day are handled by the Alice Co.'s dry crushing, pan amalgamation mill. They contain much of the sulphurets, and by roasting after crushing the process of amalgamation is successful.

South of the Alice is the Lexington lode, which extends from Walkerville on the west to the Bell copper mine on the east. It was opened soon after the Alice and was sold to a French syndicate in the eighties. The Moulton, a parallel silver ledge, was opened about the same time. Farther west is the Blue Bird, which started operations in 1885 and up to 1892 produced about 2,000,000 ounces of silver. Thus the Alice, Lexington, Moulton and Blue Bird are mentioned as the prominent figures in what might be called the silver producing era of this district. Though much silver is still being produced in Butte district, the bulk of it is in connection with copper as a by-product.

South of the silver ledges above described, and running parallel with them in an east and west direction, are five distinct copper lodes, all bending slightly toward the south as they approach the east end of the spur near Meaderville. These are known as the Bell-Modoc, Syndicate, Anaconda, Colusa-Parrot and Intermediate lodes. The first-named includes the Bell, Modoc, High Ore and Speculator. The Syndicate takes in the Yellow Jacket, Moscow, Wake-up-Jim, Mountain Con. and Green Mountain. The Anaconda lode starts with the Never Sweat, passing on eastward through the Anaconda, St. Lawrence, Mountain View and Rarus, one mile in length. The Colusa-Parrot lode is opened on its course for two miles, beginning with the Gagnon on the west, proceeding eastward through the Parrot, Colusa-Parrot, Moonlight, Pennsylvania and Silver Bow, near Meaderville.

All the lodes named, both copper and silver, are in a granite formation, the gangue usually being quartz and feldspar.

The first copper discoveries were made in the Parrott, and the Colorado Smelting & Mining Co., in 1879, built the first plant to produce copper matte in Butte. They were soon followed, however, by the Parrot Smelting Co., which erected a plant in 1881.

The Colusa-Parrot mine was first worked for silver, which led to the opening up of its great copper bodies.

In the copper zone the lodes range from 50 to 200 feet wide, but often with rich stringers passing from one lode to another, and frequently the material between neighboring ledges is so well mineralized as to

make it difficult to fix a boundary between them. This fact, it is claimed, has given rise to much of the pending litigation, the theory of the apex law opening the way, in such cases, for claiming indefinite lateral extensions of a lode.

The ores in the copper lodes are claimed to run from 4% to 60% copper and from 5 to 40 ozs. silver per ton. In the west end of the copper belt they are possibly more siliceous and better adapted to concentration than those coming from near Meaderville. In the copper mining operations the ores are separated in the mine into two classes, viz: high grade smelting ore and concentrating ore. The copper mines range in depth from 1000 to 1700 feet, and many of them have hoisting facilities to sink 3000 feet.

Mr. Chas. W. Goodale of the Boston & Montana smelter, in a paper on concentration of Butte ores, classifies them as follows: 1. Copper-silver ores, such as are produced by the Anaconda group, Mountain View, Colusa and Parrot. 2. Silver-copper ores, of which those produced by the Gagnon are examples. 3. Silver ores containing small amounts of gold, such as are produced by the Alice, Lexington and Nettie. In the first class he finds a high per cent of high-grade ore which can be smelted direct, though a considerable proportion is of a siliceous low-grade character, requiring concentration. In the ores from the Gagnon, which he puts in the second class, he finds nine-tenths of their tonnage

ings comprise eighty different claims. The Boston & Montana main shafts are the Mountain View, East and West Colusa, Pennsylvania and Leonard. The Butte & Boston operate the Silver Bow, East and West Gray Rock, Belle of Butte and Blue Jay. The Parrot Co. operate the Parrot, Stewart, Little Mina and Bellona. The Montana Ore Purchasing Co. operate the Glendary, Rarus and Mountain Chief. The Colorado Smelting & Mining Co. have the Gagnon, Nettie and others. Clark Bros., who operate the Butte Reduction Works, have the Original, Colusa-Parrot and others. To the Washoe Co. belong the J. I. C., Pauline, Washoe and Gold Hill.

Mechanical Equipment.—The mechanical equipment of the mines of the Butte district could properly form the subject of a separate article, but only a few brief notes thereon can be given herein: Taking up the Anaconda group, the Never Sweat shaft is equipped with a compound hoisting engine of the vertical type, fitted with two 26-inch high pressure and two 46-inch low pressure cylinders, each of 72-inch stroke. These engines operate skips holding ten tons of ore; the skip, ore and rope, weighing 40,000 pounds, are moved at the rate of 2400 feet per minute. Photographs of hoisting engines are enclosed, with photos of outside appearance of several mines. The engines mentioned were built by the Union Iron Works of San Francisco and are massive. I know of no larger or more powerful hoisting engines anywhere. The main valves of each engine are

THE "MODOC"—ONE OF TWO LARGE HOISTING ENGINES AT THE ANACONDA, MONTANA.

require amalgamation. Silver ores, such as come from the Alice, which he puts in the third class, he asserts, have not been concentrated with good results, because of the large per cent of silver bearing minerals being disseminated through the gangue in such minute particles that even the finest crushing does not liberate them from the quartz. These ores are treated by chloridizing-roasting and amalgamation, as at the Alice mill.

Mr. Goodale estimates the cost of concentration in Butte district to be 35 cents per ton in the plants of larger capacity, and \$1 per ton in those of smaller capacity. He places the average value of Butte concentrating ore at 7 per cent copper.

The Butte Reduction Works, consisting of smelter and concentration mill, is an interesting plant. Its concentration department, which has recently undergone complete remodeling, handles about 480 tons per twenty-four hours. Its ores come from the Colusa-Parrot, Original and Stewart, and the bulk of the tonnage is concentrated before smelting. This mill utilizes crushers, rolls, jigs and concentrators. The round tables are to be torn out. They have just commenced to regrind the jig tailings by means of Chili mills and ball grinders, the slimes from which are drawn through a system of tanks for sizing and settling, the residuum therefrom being passed over the concentrating tables.

Statistics at hand show that Butte district produces over 200,000,000 pounds of copper per annum, which is 50 per cent of the copper product of the United States and 30 per cent of the product of the world. Of the Butte product, the Anaconda Copper Mining Co. produces nearly one-half. Its principal mines are the Anaconda, St. Lawrence, Never Sweat, Mountain Con., Green Mountain, Wake-Up-Jim, Diamond, Bell, High Ore and Modoc. Its hold-

ings comprise eighty different claims. The Boston & Montana main shafts are the Mountain View, East and West Colusa, Pennsylvania and Leonard. The Butte & Boston operate the Silver Bow, East and West Gray Rock, Belle of Butte and Blue Jay. The Parrot Co. operate the Parrot, Stewart, Little Mina and Bellona. The Montana Ore Purchasing Co. operate the Glendary, Rarus and Mountain Chief. The Colorado Smelting & Mining Co. have the Gagnon, Nettie and others. Clark Bros., who operate the Butte Reduction Works, have the Original, Colusa-Parrot and others. To the Washoe Co. belong the J. I. C., Pauline, Washoe and Gold Hill.

The boilers at this shaft are five in number, 250 H. P. each; two others of same capacity are being put in. In addition to this there are now building six boilers of internal fire type, with two furnaces, shell of boiler 9 feet in diameter and 22 feet long. The new compressor here is of the Ingersoll-Sargeant make, has steam cylinders 30 and 56 inches diameter by 60-inch stroke, with air cylinders 30½ inches diameter. Another compressor of same diameter is being put in, to be ready to use soon. The compressor building being erected here is 116x81 feet; boiler house adjoining is 56x109 feet. These buildings are of structural steel frames, with brick curtains. A new steel gallow-frame is also being erected at the Never Sweat, same being 100 feet high, weighing 155 tons.

At the Anaconda shaft a new set of hoisting engines have just been installed. They are of the hori-

zontal type, fitted with cylinders 30 inches diameter by 72-inch stroke. A new steel gallows-frame has just been finished at this shaft. The St. Lawrence shaft is provided with hoisting facilities similar to those of the Anaconda. Two buildings of steel struc-

ers and a steel gallows-frame are being put in. This, like the others, is equipped to hoist from 3000 feet depth.

The air compressors of the Syndicate group have a capacity of about 25,000 cubic feet of air per

feet depth, has Riedler deferential plunger pump, with mechanically operated water valves.

The compressor room of the Boston & Montana group is an interesting feature. Its Nordberg compressor has triple expansion steam cylinders, with three-stage air cylinders. The first cylinder takes air at atmospheric pressure and compresses it to fourteen pounds per square inch; after leaving that cylinder it passes through an intercooler filled with copper tubes. Through these tubes cold water is circulated to reduce the temperature of the air. From the intercoolers the air passes to the intermediate air cylinder, where it is compressed to about thirty-five pounds per square inch. From there it passes through another intercooler to the high-pressure cylinder, which raises the working pressure to eighty pounds. This is claimed to be the only triple expansion air compressor in the district. It furnishes air for about seventy-five drills at the East and West Colusa, Pennsylvania, Leonard and Silver Bow. The high-pressure cylinder is steam-jacketed at boiler pressure of 150 pounds per square inch. The intermediate and low-pressure cylinders are jacketed with steam reduced by means of reducing valves. The inlet and discharge valves are operated by separate eccentrics, permitting a wide range of adjustment. The condensers consist of two Nordberg air pumps, each having capacity to handle the entire plant. The circulating pump is of the rotary type, being operated by a small engine.

At the Butte & Boston smelter, at Meaderville, four new converters, twenty-five tons capacity each, are being put in, making this plant, like others in the district, able to reduce the copper matte to bullion. A new steel frame building is being erected to enclose the converters.

The Precipitation Process.—Most of the copper mines of Butte district produce considerable quantities of water. In a few cases city water is turned into them to extinguish fires therein. The water comes in contact with the sulphide of copper ores, which, by the action of water, heat and air, is changed to a sulphate, the latter being soluble in water. The superfluous water, from whatever cause its presence in the mine is attributed, must be pumped out. In many cases, in which it is strongly impregnated with copper sulphate solution, the water is pumped to the surface into tanks filled with scrap iron. By adding common salt to the solution in these tanks the sulphuric acid therein is changed to muriatic acid, which, acting rapidly on the iron, converts it to a chloride solution, the pure copper being precipitated in its stead. This method of saving the copper, which was formerly lost in solution in the superfluous water from the mines, has become an important branch of the industry. The Anaconda Co. operates quite a plant by this method, while the B. & M. Co. leases the privilege to outside parties on a royalty. This method is said to have been first practically exemplified by a man "who was too lazy to work." He doesn't have to work much now.

Butte, Mont., Nov. 15th, '98.

WASCOTT.

Transference of Heat.

TO THE EDITOR:—A correspondent of *Nature* who is associated with the observatory at Toulouse calls attention to a singular phenomenon, the scientific explanation of which he seeks. Take a bar of iron in the hand by one end and plunge the other end in the fire, heating it strongly, but not so much that the hand cannot retain its hold. Then plunge the heated end in a pail of cold water. Immediately the end held by the hand becomes so hot that it is impossible to retain it in the fingers. This phenomenon, said by the correspondent to be familiar to workmen in iron, is ascribed by them to some repellent action which they suppose the sudden cold to exert upon the heat contained in the iron, which is thus driven to the opposite extremity.

An answer to the above seems simple. Heat is but a manifestation of motion; the more intense the motion the stronger the manifestation. The plunging of the iron into a cold medium intensifies or increases the motion, hence the observer's so termed phenomenon.

That there is violent motion involved in violent cooling is shown in the rearrangement of the particles of some metals by the act—for instance, the carbon in steel.

It may be suggested that there is an electrical condition involved or evolved, but as heat and electricity are convertible terms that does not change the determination at all.

As heat and cold are but comparative conditions, anything above ultimate cold being warm and anything below ultimate heat being cool, it can readily be perceived that any increased violent motion will manifest itself to our senses as heat.

Heat and cold not being entities, it is evident they do not exist but as recognized sensations, consequently they can hardly be conceived of as being engaged in combat in a mass of iron, as suggested above.

A determination of the question can be had by intensely heating a determined mass of metal to a determined degree of heat, and plunging into a determined mass of cooling medium of known capacity for heat, and observing if the cooling medium

THE "MODOC" AND THE "AZTEC," TWO OF THE LARGEST HOISTING ENGINES IN THE WORLD.

ture have just been completed for blacksmith and carpenter shops.

The same company's shafts in the Syndicate group, consisting of the High Ore, Bell, Diamond, Green Mountain and Mountain Con., are also well equipped with machinery. The High Ore has a 30x72-inch hoisting engine of same pattern as that of Anaconda and has a compressor of same type and dimensions as that of Never Sweat. At this shaft six new boil-

minute. The West Colusa shaft of the Boston & Montana Co. is three compartment, heavily timbered, each compartment being 9 feet by 5 feet 4 inches, in which are operated two-car, single-deck cages. Above the shaft is a steel gallows-frame 76 feet high. The hoisting engine is of the Nordberg type, 20x60 inches, direct acting, with steam brakes, clutches and reversing gear. It is high speed and almost noiseless. The same company's Leonard shaft, 700

manifests more heat than is due to the change of temperature of the metal mass. If it does, it will manifestly be due to the violent cooling.

CALIFORNIAN.

The International Date-Line.

Our acquisition of the Philippines, according to an agreement between the American and Spanish peace commissioners at Paris last Monday, stimulates the study of general geography, and persons to whom the Pacific ocean was formerly but a broad, uninteresting waste of water, will now become fairly familiar with the positions, resources, and strategic values of those islands, and conversant with cable routes, differences of longitude and time, ocean distances, and other matters that formerly attracted but slight attention. There is one point, however, upon which appears that there is something to be said.

Dewey's great battle at Manila was begun at about 5 o'clock in the morning, on May 1st, by Manila time; and the public press has frequently discussed the question of when the battle began, by New York time. Some of the articles have favored Sunday afternoon, May 1st, and some Monday afternoon, May 2d, others, correctly, have decided upon Saturday afternoon, April 30th. It is here proposed to establish the correctness of the Saturday date, and to give data which will enable the reader to compare any proposed New York date and hour with the corresponding date and hour upon most of the Pacific islands that are of any considerable present importance, and, approximately, with any San Francisco date.

First, it is necessary to recall the fact that at any given instant the local time at any given place west of New York is earlier than New York time by one hour for every 15° of longitude that lies between the two places. Thus when it is 4 o'clock p. m. by New York local time, it is 3 o'clock (local time) at a place 15° west of New York, 2 o'clock at a place 30° west, and so on. This is indicated by the figures at the bottom of the accompanying map of the world. (The longitude of New York is not precisely 75° west, but the map illustrates the point well enough for present purposes.) The fact that local time is one hour earlier for every 15° that we go westward is readily understood by the following reasoning: When the sun is just rising at New York, it will not have risen yet at any point due west of that place. That is, it will rise later at points that are to the westward. Suppose, now, that we wait precisely one hour. The sun will then be one hour high at New York, and there will be a place, somewhere to the west of New York, where it is just rising. Let us mark this new place, wherever it may be. Then, whatever the hour may be at New York, the local time at the spot so marked is one hour earlier. In the same way, let us select another place, farther yet to the westward, where the local time is one hour earlier still, and having marked this place, let us proceed in the same way until we have portioned out the entire twenty-four hours, and found twenty-four stations, such that between every two consecutive stations there is a difference in local time of one hour. The vertical lines on the map are spaced off in this way, as indicated by the figures at the bottom of each of them. There are 360° in every circle; and therefore when one goes entirely around the world along any one of the horizontal lines (which represent circles of latitude), he must pass through 360° of longitude. As there are twenty-four vertical lines, each one hour from its neighbors, it will be seen that the difference in longitude between any two of the twenty-four successive hour lines is $360^\circ \div 24 = 15^\circ$; showing that the local time is one hour earlier for every 15° that we travel to the westward.

It is now easy to compare the hours at any two places on the earth, by allowing one hour for every 15° difference of longitude between the two places, and remembering that the time grows earlier towards the west, and later towards the east. Thus Manila is approximately on the 120th meridian of east longitude (reckoning always from Greenwich, England); and hence when it is 5 o'clock, A. M., at Manila, it is approximately 4 o'clock, P. M., in New York. The figures at the bottom of the map show the hour for every 15° of longitude, throughout the world, when it is 5 o'clock A. M., at Manila. The relations of longitude and the local hour are so simple, that it may seem strange that any question should arise about the New York time of Dewey's fight; but it will be observed that thus far we have only discussed the hour on each meridian, and the fact is, that it is not the hour that gives rise to the numerous discussions that have been held, but the day. It is generally admitted that the fight began at 4 o'clock in the afternoon, by New York time, and the only question at issue is, whether Sunday at Manila corresponds to Saturday, Sunday, or Monday in New York.

To clear up this matter, let us imagine a traveler

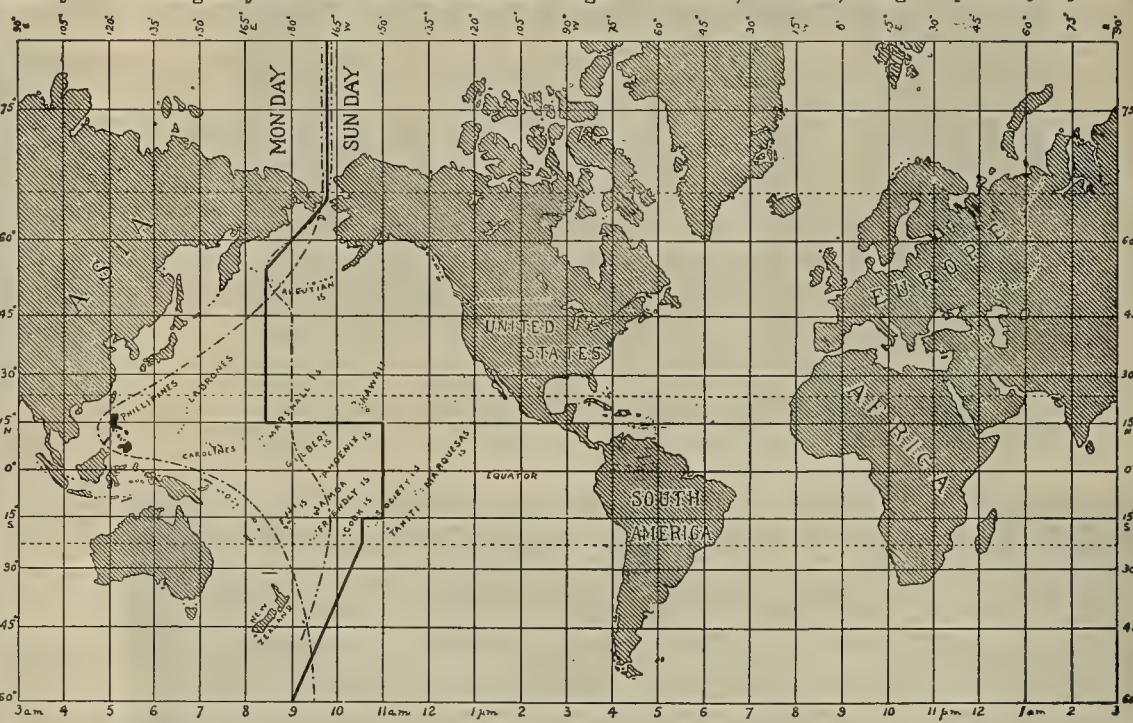

journeying to the westward. Let us suppose that he leaves New York at noon on Sunday, and let us suppose, further, that he travels just as fast as the earth turns on its axis, so that he follows the sun in its apparent westward progress with such precision that he always keeps it directly south of him. It will be noon, therefore, at every place he passes. Suppose, now, that he asks, at every point of his journey, what day of the week it is. Leaving New York on Sunday noon, he will be told, in Jersey City, that it is Sunday. At Pittsburgh he will also be told that it is Sunday. At Chicago they will answer "Sunday," and the reply will be the same at Omaha, Denver, and San Francisco. Even away out in the Pacific, at Hawaii, they will still tell him, as he passes through the islands, that it is Sunday noon. But this thing will not be kept up indefinitely, because when he has gone all the way around, and has returned to New York, he will have been gone twenty-four hours, and the New Yorkers will insist that it is Monday noon. Everywhere in Europe, too, he would have been told that it is Monday noon. Yet it has always been the same day to him. The sun will have been always due south, and everybody that he has met will have admitted that it is noon. There must be some place on the journey where he will be told, for the first time, that it is Monday noon, instead of Sunday noon. At this place, if he wishes to be in accord with people that he meets, he must arbitrarily change the name of his day from Sunday to Monday. To a landsman this arbitrary change in the date is strange and confusing; but the mariner who sails the Pacific ocean grows accustomed to it, so that for him it loses its strangeness.

Our imaginary traveler would find that the change

is given on page 120 in the popular edition of a school geography. This line, reproduced herewith, comes down through Bering's strait, sweeps away to the westward so as to just pass to the westward of the Philippines, and then returns, in a southeasterly curve, so as to pass south, just to the eastward of New Zealand.

The line just described was intended to separate the islands that were colonized from the east from those that were colonized from the west. Since this line was published, however, new information concerning the early history of the Pacific islands has become accessible, and one is now able to draw a line which effects the separation a little more accurately. If drawn strictly according to historical principles, the date line should cut across North America, following the line that now separates Alaska from Canada; for Alaska was first colonized by the Russians, who brought with them the Russian date. When American settlers moved there, they carried with them the date of the United States, and this led to some confusion. The difference in the dates was rendered of less importance, however, by the fact that Russians still use the Julian calendar, and hence their dates do not agree with those of other countries, under any circumstances. The only practical difficulty that the double origin of the settlers introduced, was that the Sunday of the Americans was the Monday of the Russians. When Alaska was purchased from Russia, in 1867, the date in use there was made to conform to that used in the United States; so that at present, there is a uniform practice regarding dates, throughout the continent of North America.

This line, however, though it probably separates

MAP OF THE WORLD, SHOWING THE INTERNATIONAL DATE-LINE, ACCORDING TO VARIOUS AUTHORITIES.

in his day would come somewhere between North America and Asia; but when we come to ask more precisely where the change would take place, we find that there is some difficulty in deciding; and it is this difficulty, in all probability, which has led to most of the disputes about the New York date of Dewey's victory.

Mariners are in the habit of changing the date arbitrarily, upon crossing the 180th meridian from Greenwich, England; but this fact is of no service to us, if we wish to compare the date of one of the Pacific islands with the corresponding date at New York, since the mariners pay no attention to the local dates on the islands that they pass. The ideal way to find out where the date actually does change would be, to canvass the entire Pacific ocean, so as to find out what date is actually in use on every one of the islands, when it is (say) noon on the 180th meridian of a certain day at a particular place. A line drawn from pole to pole in such a manner as to keep all islands bearing one date on one side, and all islands bearing the other date on the other side, would afford us a perfectly definite basis for the comparison of dates. Such a line is called the "International Date Line." The Hydrographic Office of the U. S. Navy Department says that "no information concerning the actual date in local use on each of the Pacific islands has as yet been collected and published, in such authoritative form as to be entitled to entire confidence. As a general rule, it may be said that the date will probably be found in use, at the different islands or groups, which results from the one carried there by the first European or American colonists, and which, therefore, must be a different one according as the colonists came from the east or west."

A line drawn, presumably, from data of this kind,

with some degree of accuracy the islands that were colonized or discovered from the east and west respectively, does not represent the present course of the true "international date-line," where the day changes as we pass from island to island. The actual present date-line passes to the eastward of the Philippine islands, for example, as will be seen by the following bit of history. The Philippines were discovered by Magellan, in 1521, and Manila, the chief city, was found by Legaspi just fifty years later, in 1571. Magellan sailed around Cape Horn, bringing his date from the east. After the islands were colonized, too, they kept the same date as the Spanish possessions on the opposite side of the Pacific; and this condition of matters prevailed until nearly the middle of the present century. The Philippines having then come into commercial relations with neighboring countries and islands to which the date had been brought by way of Cape of Good Hope, it was found to be inconvenient to retain the date that had been brought from South America. Accordingly, under date of August 16, 1844, Narciso Claveria, who was then Governor-General of the Philippine Islands, issued a proclamation in which he decreed that, "considering it convenient that the mode of reckoning days in these islands shall be uniform with that prevailing in Europe, China, and other countries situated to the east of the Cape of Good Hope, I ordain, with the consent of his Excellency the Archbishop, that, for this year only, Tuesday, December 31st, be suppressed, and that the day following Monday, the 30th of the same month, be styled Wednesday, January 1, 1845." This proclamation, having the sanction of both the civil and ecclesiastical authorities of the islands, was effective; and the date now used on the Philippine islands agrees with that prevailing at Hong

Kong and other Asiatic ports to which the date was carried by way of Cape of Good Hope. This places the Philippines to the west of the present date line. The Hydrographic Office states that "the Mariana or Ladrone islands, which are under the political government of the Philippines, may also be safely placed as west of the date line, but some doubt is felt as to the date in the Caroline islands, although this group, being mainly under Spanish rule, probably carries the same date as the Philippines. The Fiji islands are reported to carry the same date as Australia."

Recent editions of geographies take account of these facts, the date-line being shown as following the 180th meridian more closely; passing through Bering strait and sea, leaving all the Aleutian islands to the east, and joining the 180th meridian just south of that chain. It leaves the meridian of 180° again just north of the equator, and after passing to the east of Samoa, Tonga, and Chatham islands, which use the same date as Australia, it joins the meridian of 180° again in about 45° south latitude. This line is shown on the accompanying map, and is nearly correct.

Finally, Professor William Harkness, Director of the United States Naval Observatory, gives the course of the date-line as follows: "Starting in the Arctic ocean, along the 169th degree of west longitude from Greenwich, to latitude 65° north; thence to a point in latitude 55° north, longitude 172° east; thence along longitude 172° east to latitude 15° north; thence along latitude 15° north to longitude 150° west; thence along longitude 150° west to latitude 15° south; thence along latitude 15° south to longitude 156° west; thence along longitude 156° west to latitude 23° south; thence to a point in latitude 60° south, longitude 180°; and thence along longitude 180° to the south pole." The line so defined is shown full and black in the accompanying map.

A few words more will make the use of the date-line clear. Manila is in longitude 120° east (its exact position is latitude 14° 36' north, longitude 120° 52' east). When it is 5 o'clock, Sunday morning, at Manila, it is 8 o'clock, Sunday morning, in longitude 165° east, as will be seen by the map. If we continue to go east, we shall find that when we reach longitude 135° west, that the hour will be 12 o'clock, noon; but the name of the day must be changed from Sunday to Saturday, since we have crossed the black date-line; and in crossing the date-line going east, we must go back one day in our date. Therefore, although our journey from Manila has been instantaneous, and we have not seen the sun either rise or set, we must call the time Sunday noon when we reach longitude 135° west. From this longitude eastward to New York we do not cross the date-line again, so we merely add one hour to the time of day, or every 15° of longitude that we cover. New York does not use her own local time, having substituted for it, "standard time," which in her case is the local time of the 75th meridian. Following eastward to longitude 75° west, and adding one hour to the time for every 15° of longitude traversed, we find that it is 4 o'clock Saturday afternoon, by New York time, when it is 5 o'clock Sunday morning, by Manila time. Hence Dewey's battle began at 4 P. M., on Saturday, April 30th, by New York time. In order to verify this result, let us continue eastward from New York until we reach Manila again. Adding one hour to the time for every 15° of longitude; we find that it is 11 o'clock, Saturday night, when we reach longitude 30° east; midnight, Saturday night, at longitude 45° east; 1 o'clock Sunday morning at longitude 60° east; and so on, until we reach Manila, in longitude 120° east, where we find that it is 5 o'clock Sunday morning, which verifies our work. In going from New York eastward to Manila we do not make any sudden change in the date, because we do not cross the date-line.

A few examples may make the use of the date-line clearer. (The full, black line of the Naval Observatory is to be taken as the true date-line in these examples.) (1) When it is 4 o'clock Wednesday morning at a place on the equator in longitude 135° west, it is 1 o'clock Thursday morning at the point whose latitude is 30° south, and whose longitude is 80°. (2) When it is Friday at 4:30 P. M. in latitude 45° south and longitude 165° west, it is also Friday at 4:30 P. M. in latitude 30° north and longitude 165° west. (3) When it is Tuesday at 11 o'clock P. M. in latitude 14° north and longitude 179° east, it is Tuesday at 1 o'clock A. M. in latitude 16° north and longitude 151° west. A very curious fact that the date-line suggests is: if the heavy black date-line is correct, then from 5 o'clock A. M. to 7:32 A. M., New York time, there are three different days in use in the world. For example, from 5 A. M. to 7:32 A. M., New York time (i. e. 75th meridian time), on Thursday morning, it is Thursday throughout most of the world; but there is one region where it is Wednesday, and another region where it is Friday. The reader can prove this fact, and locate the regions, he will have a pretty clear understanding of what the date-line is.

Cleaning Mercury.

TO THE EDITOR:—In the issue of the 19th inst., under the heading of "Temperature of Battery Water," an incidental mention is made of the use of

acid and cyanide of potassium in cleaning mercury, with which I make no issue, but wish to say to inexperienced millmen, be very cautious and discreet in your treatment of mercury, and even more, of your plates, with acids and cyanides. I believe it to be a too common practice to give the plates a free bath of one or the other of these chemicals, without after using anything to neutralize their effects; consequently their surfaces are left saturated with it, resulting in the rising of a copper film for days, imperfect amalgamation and loss of gold. I believe it would have been almost better for mine owners if the virtues of acid and cyanide in relation to mercury had never been determined. The caution cannot be too often or too emphatically reiterated.

CALIFORNIA.

The Refining of Base Lead Bullion Containing Silver, and High in Gold.*

NUMBER V.

By G. H. BLAKEMORE.

Retorting the Alloy.—In some refineries the Tatham retort furnace is used, in others the Brodie. I have worked the Du Faur tilting retort furnaces, and for easy handling these furnaces are far and away ahead of the others. A few improvements can be made on the Du Faur furnace as shown in text books on lead. For instance, the worm gear for revolving them can be left out altogether as it is a nuisance, and the arm of 1½ flat iron projecting some 6 inches, riveted onto the side of the furnace instead. When the furnace has to be revolved, a piece of 1½-inch pipe 3½ feet long, slightly flattened at one end, is slipped over the 1½-inch arm, and the leverage so obtained enables the workman to tilt the furnace with the greatest ease and steadiness, so that as little as a spoonful might be poured out of the retort. Another improvement is to connect all the grate bars to a lever, so that by a backward and forward movement of the lever the grate bars all work together, allowing the ashes to fall through. This lightens the work on the men and an occasional shake on the lever keeps the grate clean and bright.

Six furnaces, capable of taking a Class 409 Battersea retort, will handle all the alloy made in a plant treating 150 tons of silver-gold-lead weekly. Each retort will take 560 pounds of alloy. They cost about 50s. each in London. Their life is very variable. Eight retorts taken at random lasted as follows: 35, 8, 23, 23, 18, 24, 22, 21 charges. Leaving out the low one the average is roundly 24½ charges each, which is about the usual figure obtained in refinery works.

Work on the Retorts.—When the retort is hot enough the charge of alloy is weighed out and as much as the retort will hold is shoveled into it. In half an hour or so the charge in the retort sinks down considerably and more of the remaining portion of the charge is put in, until at last the whole of it has been shoveled into the retort. A small shovelful of coal is put into the retort on top of the alloy and the condenser is then slung to the furnace by its chain and luted up over the neck of the retort. The fire is then urged on to heat up the retort as rapidly as possible.

The condenser is made of ½ thick iron plate bent to form a round pipe about 10 or 11 inches in diameter and about 18 inches long. A bottom (with a 1 to 1½ inch hole, 2½ inches to its center from the edge) is riveted on. The open end is cut diagonally, so that when it is slung over the neck of the retort, which projects out of the furnace, the diagonally cut edge will be flat up against the vertical face of the furnace, so giving the retort a drop out of the horizontal line of about 9 inches. The bottom of the retort has a staple riveted on it to allow a chain of iron, with a ring at each end, to pass under it. The rings hook onto lugs on the furnace and in this manner the condenser is supported. A thin lining of lime-clay and cement composition is rammed around a wooden centerpiece and when this is withdrawn it leaves the lining about 1½ inches thick in the condenser. On the top side of the condenser are two more 1-inch circular holes, the one nearest the top being so placed that a rod can be passed through into the inside of the retort. The other one is near the lower end of the top side. In work, the hole for trying the retort and the tap hole on the flat end of the retort are plugged with a piece of fireclay, the other one is left open for the zinc vapors to escape. Sometimes an explosion takes place and the condenser is blown off. The heat is an important matter in distilling the zinc; the higher it is the quicker the work and the more zinc obtained. In about an hour or so after the condenser has been luted on, the flame from the vent hole changes in color to the peculiar greenish tinge of burning zinc, showing that the distillation and condensation of zinc has commenced. It takes from ten to sixteen hours to finish a charge, some alloys working much better than others, or it may be that the workmen let the heat fall during the operation, although they can never be caught at it. At intervals the tap hole is opened and the zinc runs out into moulds. The quantity produced is very variable; more zinc is always obtained from silver crust alloy than from gold crust alloy. When at last no more zinc is forming in the condenser (the appearance of the vent hole shows this) it is removed and

the lead is then poured out direct into moulds that stand on trucks, by tilting the furnace. A small shovelful of coal is thrown into the retort to prevent oxidation of any lead left behind, for the litharge thus formed would soon eat holes in the retort. If it is possible to do it easily, it is advisable to partly turn the retort after every half a dozen charges to change the line at which the lead stands, because the retort is usually eaten through at the line of the melted charge.

Everything produced is sampled, usually to know how the work is proceeding. The zinc obtained is used over again in the desilverization of fresh charges of softened bullion. If a refinery is being run on the lines of producing silver bullion without parting, and only a small amount of dore bullion, it is advisable to use the retort zinc only when zinging for gold. Otherwise the zinc made by retorts working on gold alloy, and that from the silver alloy retorts, is sure to be mixed by the men and as there are always small traces of gold in zinc from the gold alloy retorts, it will contaminate the silver crust made and of course will prevent making silver free from gold.

In addition to the bullion and dross produced by the retorts, there is made a variable quantity of zinc powder more or less high in silver and gold. Mixed through it is quite a considerable amount of scrap metallic zinc and this is recovered by sieving the powder through a No. 12 sieve. The scraps can be melted up in an iron pot and cast into bars for use again. The powder which goes through the sieve is bagged up to save loss and sent to the blast furnaces, and used on the charge in small quantities at a time.

The following assays will serve to give an idea of the value of the retort bullion, with retort dross and zinc powder per ton produced from the same charge, each line representing a complete charge:

| Retort Bullion. | | Retort Dross. | | Zinc Powder. | |
|-----------------|----------|---------------|----------|--------------|----------|
| Ag. Ozs. | Au. Ozs. | Ag. Ozs. | Au. Ozs. | Ag. Ozs. | Au. Ozs. |
| 1860.9 | 243.6 | 1923.40 | 141.3 | 7.32 | 0.04 |
| 2533.2 | 304.0 | 1866.40 | 168.8 | 20.52 | 1.84 |
| 2621.0 | 155.7 | 2343.90 | 416.2 | 15.32 | 1.02 |
| 2418.9 | 182.5 | 1875.66 | 183.6 | 1.18 | trace. |
| 2592.0 | 96.0 | 1044.1 | 205.2 | 20.78 | 2.74 |
| 3866.7 | 371.1 | 1367.9 | 141.7 | 2.18 | trace. |
| 2033.8 | 182.1 | 1601.1 | 241.85 | 5.47 | trace. |
| 2702.2 | 450.0 | 2074.25 | 347.85 | 332.21 | 52.24 |
| 3119.9 | 483.3 | 1579.15 | 236.05 | 6.89 | 0.59 |

The zinc powder in No. 8 is very high both in silver and gold, probably due to some of the rich bullion having run over into the condenser.

The following figures are based on 475 retort charges and show the average weight of the different products produced per charge:

| Charge Weight, Lbs. | Bullion Produced, Lbs. | Zinc Produced, Lbs. | Dross Produced, Lbs. | Zinc Powder, Lbs. | Coke Consumed, Lbs. |
|---------------------|------------------------|---------------------|----------------------|-------------------|---------------------|
| 552 | 423 | 48.09 | 61.40 | 21.20 | 506 |

The amount of zinc recovered is usually about 60 per cent of the virgin zinc originally used.

(To be Continued.)

Tunnel Rights.

One who locates and prospects by a tunnel, under the Colorado act, has a right to 1500 feet along an undiscovered "blind" vein or lode discovered in the tunnel for a distance of 3000 feet from the surface of the tunnel. His right dates from the location of or the commencement of work upon his tunnel, and is contingent upon his prosecuting his work with reasonable diligence. If a claim is located along the line of the tunnel, the surface locator has the right to all veins, lodes and ledges within the lines of his location as against the tunnel owner to the same extent as he has against a subsequent surface locator; that is, a surface locator by virtue of his discovery of mineral in place in a vein, has thereby the right to locate so much of the surface ground and to obtain a patent thereto; by this right he also becomes possessed of all veins, lodes and ledges whose apexes are within the said lines of his claim extended downward vertically, and this whether these veins are what are called "blind" lodes or whether they appear at the surface. If his discoveries are prior in point of time to the location of the tunnel or the commencement of work thereon, he has this right, although these lodes or veins may be within the line of the tunnel and be subsequently found therein. This point was not raised in the case of the Enterprise Mining Co. vs. the Rico-Aspen Co., recently decided in the Supreme Court of the United States. The point there decided was as to the title or right of possession to a blind vein discovered within the said lines of a surface location made subsequent in point of time to the location of the tunnel, the vein being a "blind" one or one not appearing at the surface and being subsequently found in the tunnel. The court, under this state of facts, decided that the tunnel owner was entitled to the vein, and that he did not need to adverse the surface man when the latter applied for a patent, if at the time he had not discovered the vein in his tunnel.

Temperature of Battery Water.

TO THE EDITOR:—In the issue of Nov. 19th I note an article on the above subject, that induces me to give my experience in the matter. I have worked ores and operated the milling of gold-bearing quartz for the past forty years in all climes, hot and cold, and invariably found that when the battery water was below 50° it had to be heated to obtain best results in the saving of gold. I found that when quicksilver was fed into the mortars, the water being at a low temperature, the cohesive power of the quicksilver was lost to a perceptible degree, hence it became a poor medium for gold saving, more especially if the rock contained even a small percentage of pyritic matter, which assisted materially the non-cohesive action of the quicksilver, and, by the trituration of the stamps into cold water, becoming subdivided into minute globules, its natural affinity impaired, these globules escaped from the plates and were lost. This was shown by assay of tailings and slimes. By heating the battery water to a temperature of not less than 80° or more than 90°, the quicksilver became normal, lost none of its cohesive power, but was considerably increased and active. Then the maximum saving of gold was attained. The inside plates did not scour, but retained 75 to 80 per cent of gold in the mortars: but care had to be exercised that the amalgam was not allowed to get too thin. By carefully watching the outside plates, the quicksilver could be easily regulated, and less used—requiring less, being so much more active in its warm state than when used with cold water. I would never permit the use of any nitric acid on the plates, even in its most diluted form, as it has too ready an affinity for silvered plates, which creates a nitrate of silver in weak form; but the action is sufficient to cause oxidation, rendering them inert and destroying their gold-saving property. A weak solution of potash or cyanide is well enough, used with care and sprinkled lightly over the plates, rubbed up with a soft, new shoe-brush, but always used from below upwards. If in good condition, the plates will show the marks of the brush hairs, giving a slightly corrugated appearance.

Making White Lead by Electricity.

To the Editor of *Electrical Review*: Referring to your publication of a notice on "The Manufacture of White Lead by Means of Electricity," in your issue of Nov. 2, page 280, I beg to call your attention to the fact that a process has been patented lately in the United States which produces a white lead of superior quality by means of electricity. A small plant is now in operation in Brooklyn, by which between five and six pounds of white lead are produced per hour. The process employs a solution of ammonium nitrate and bicarbonate, and produces two pounds of white lead per electrical horse-power hour. The product is perfectly white, and has a body and covering capacity equal to the best quality in the market. The process is continuous, and requires no interruptions for the removal of the product. The cost of operation depends exclusively on the cost of electrical energy, the electrolyte being continuously regenerated. This process has the advantage as against the process mentioned in your paper that the ammonium salts used prevent the formation of plumbites and plumbates, which, on being reduced on the cathodes to spongy metallic lead, waste electrical energy, besides spoiling the product.

L. P. C.
New York, Nov. 10th, '98.

THE cost of bringing a car of machinery by rail from New York to the Pacific coast is \$1.25 per hundred. The same carload can be sent from New York to China for \$1.15.

ACCORDING to careful estimates three hours of close study wear out the body more than a whole day of hard physical exertion.

Railroad Contractors' Car.

The heavy railroad contractors' car shown in the accompanying illustration is built to stand the hardest kind of service, and its makers—the Gates

the Jeffrey Mfg. Co. that a belt, in order to withstand severe usage, should possess not only strength, but also be of a composition to resist the abrasive character of the materials handled. In the Century belt plies of extra heavy

RAILROAD CONTRACTORS' CAR.

Iron Works, Chicago, Ill.—say it has given universal satisfaction. The illustrations graphically portray its use and purpose. It weighs 8280 lbs. Its general specifications are as follows: Standard gauge, wheels 24" diameter, length of box 9' 6", width of box 8', depth 2'. For railroad quarry or open-cut work it is of material service.

Century Conveyor Belt.

The Century conveyor belt, herewith illustrated, has been brought out by the Jeffrey Mfg. Co. of Columbus, Ohio,

CENTURY CONVEYOR BELT.

for their special use in conveying materials of various kinds, particularly for handling gritty and abrasive material, such as ores, broken stone, gravel, sand and the like. It has been demonstrated in every-day practice of

carrying surface reinforced to any thickness that the work requires. For prices and further information address the Jeffrey Mfg. Co. at its main office and works, Columbus, Ohio, or at any of its branches.

Brake for Mining Cage Hoist.

An improved form of brake for mining cage hoist has been recently tried on the Cabitza shaft of the Malfidano mines. The brake is purely mechanical and of simple construction. A rope is attached to a rod, which is guided by a stirrup attached to the cage. A spiral spring surrounds part of the rod. In connection with this spring two sets of brake bars are operated, arranged at right angles to one another. Each consists of a central part, and at each end there is a jointed limb. The limbs of the one set form straight bars, those of the other, forks. These limbs can engage under certain conditions, the first set with the guide rails of the cage, the second with the horizontal beams of the shaft structure. As long as the rope is holding the cage the spring is under tension, and the limbs mentioned are bent down so they clear the obstacles. When the rope breaks the weight of the cage straightens the brake bars, so that the central part and the limbs form in each case a straight line. The limbs will then press against the guide rails and prevent the rapid descent, and the forks will come to rest on the horizontal beams which are placed about 5 feet apart.

A RECENT TRAVELER among the Indians of Catuquinarn, in the Amazon region, between the rivers Embyria and Embyrasu, says they employ a wireless telephone. It is made by digging a hole in the ground inside the house and laying the bottom with coarse sand well piled. On this is laid a wooden drum, or hollow cylinder of wood, half filled with fine sand and layers of broken wood, bone and powdered mica. The upper part of the cylinder, which is empty, rises above the floor of the hut, and is closed by leather, then wood and lastly india rubber. Outside the cylinder is packed round with fragments of wood, leather and rosins, which are covered with hard rubber at the level of the soil. To use the apparatus the drum is struck by a wooden hammer, and the vibration is evidently transmitted through the soil. The answer is heard in the drum, which acts as a resonance chamber. Messages can thus be sent over 1500 yards from house to house.

SUPERINTENDENT C. A. Boyd, of the Walker Manufacturing Company, is reported in the Cleveland, Ohio, *Press* as saying: "Electricity will completely supplant steam as a motive power in less than ten years. We are to-day building electrical power devices that two years ago were not conceived. If the knowledge of electricity and new methods of using this mysterious power advances in the next decade as it has done in the last, steam locomotives and factories operated by steam power will be curiosities."

THERE is a scheme on foot for the improvement of Table Bay harbor, Cape Colony, which will involve ten years time in the completion of the engineering work, and will require an expenditure of \$25,000,000, approximately. The project provides for the enlarging of the dock, increased graving dock accommodation and a hydraulic plant for the landing of coal. The harbor, when completed, will embrace 208 acres; it will have five jetties, three of them 1800 feet long and two 1000 feet long.

AN invention has been devised by which photographs may be taken under water. The light is furnished by an incandescent lamp in a steel case in the diver's headpiece, the luminous rays being protected by a reflector placed in the rear of the steel case, and the electricity provided by a small dynamo carried in the boat above. The photographic apparatus consists of a common camera within an india rubber envelope, its front glass. The machine is regulated and pictures taken by pressing buttons through the india rubber covering. It has been thus demonstrated that pictures can be taken under water of objects at a distance of 10 or 12 feet.

Mining Summary.

ALASKA.

The last monthly report of the Alaska-Treadwell mine shows 22,000 tons ore crushed and \$59,314 in bullion. Ore averaged \$2.70 per ton. There were 425 tons sulphurets treated, yielding \$30,981, included in the total. Expenses for the month were about \$31,000.

On Nov. 14th at the Alaska United gold mill 120 stamps began operation; another mill of 100 stamps will be completed in April and the Alaska-Treadwell mill of 300 stamps will be running in May, and 880 stamps will be dropping within a radius of a mile and a half. They will make 1800 tons of sulphurets per month. These mills are all on the same ledge, which in one place on the Treadwell ground is 416 feet wide. They are down in the deepest place only 420 feet.

Juneau Miner: The Apollo mine of the A. C. Co. at Unger gives occupation to 150 people. For eight years work has been conducted in this mine. Between \$30,000 and \$40,000 is produced by the 40-stamp mill every month. The concentrates, which average \$40 per ton, are shipped to San Francisco for treatment.

Another promising mine is the Sitka, one mile from the Apollo, supposed to be on the same ledge. Extensive development work has recently been carried on at this property and it is contemplated to build another mill shortly. All the gold, 90 per cent or more, heretofore credited to Cook Inlet, was taken from the placers along the streams emptying into Turnagain Arm, one of the headwaters of the Inlet. Several claim owners on this creek have daily cleanups.

On Six-mile hydraulic operations will begin early next season; the plant is already on the ground. Resurrection creek has been worked for several seasons, but very little prospecting has been done further up the creek than seven miles. The gold on this creek is fine and quicksilver is necessary to save it. The average output per day to the man on it is perhaps about \$3.50. Across the arm a company of Californians are making extensive preparations for hydraulic mining. In addition to placer mining, some work has been done on quartz prospects in different parts of the arm, while large improvements are being made at Snug Harbor. About 300 people will winter at Hope and Sunrise, the chief mining camps of this section. The output of gold for the season is hard to ascertain, but it will be less than last year, in consequence of high water.

ARIZONA.

At the Grand Reef mine, at Wilcox, development work continues and some good veins have been found. On the Del Monte group of mines, near Harrisburg, seventy-five men are at work. Near Russellville, on the Wolfraimite claims, sixty men are at work.

The Katie mine, at Mineral Park, is developing into a silver producer. A crosscut tunnel is broken into a ledge of 700-ounce ore at a depth of 160 feet. The first shot knocked down a ton of ore worth \$400.
